—In No. 821 of the *Nation* attention was called to the *Archiv für Mittel- und Neugriechische Philologie*, published by Dr. Michael Deffner of the University of Athens, and to the contributions therein made to our knowledge of the dialect spoken by the Tsaconians. This interesting people, inhabiting a few mountain villages on the east coast of Peloponnesus, has preserved some peculiarities of the ancient language more perfectly than any other of the modern Greeks. Dr. Deffner has published recently the first part—Phonology—of his Tsaconian grammar ('Zakonische Grammatik,' Berlin, 1881), in which he presents in systematic form the results of his careful researches. All previous attempts at such a work have been either entirely unscientific or generalizations from a few imperfectly-known facts. This grammar, from a firm basis of facts, deduces in a scientific way the laws of the modification and loss of consonants in passing from the earlier stage of the Greek language. Never again can the claim be made that this is a Slavic dialect. The author not only aims to show that the Tsaconians are descended from the Laconians, but even thinks that he discovers from the modern phenomena peculiarities in the ancient Doric dialect of Sparta. The change of initial consonant from Lacones to Tsacones remains, however, without another example to support it. As the author rehearses the losses, gains, and modifications of words which have taken place in the dialect during this century, he emphasizes the importance of doing at once the work on which he is engaged, but makes us wonder that so much should have been preserved during 2,000 years. Many of his etymologies are bold, and some seem improbable, but most follow well-determined laws and are convincing. The ground had to be cleared of considerable rubbish before he could begin a scientific discussion of his subject, but the book as a whole is free from a polemic tone. This is the more creditable, as the author has been pestered with criticisms from men who could not forgive him for living in Athens, and yet believing that the classic Greek language did not have seven signs to express one sound. He touches on this in his 'Grammar,' where he says that the modern Greek has so changed its vocabulary that there is no preponderance of the *i* (ē) sound, although there are so many signs for it ; but that ancient Greek is monotonous and horrible (*eintönig und schrecklich*) when pronounced according to the modern Greek rules. It is strange that the question of pronunciation should so long have continued a subject of acrimonious debate. Dr. Deffner announces a volume of 350 quarto pages in the modern Greek language, illustrated with numerous woodcuts, to treat of the history and topography of the Tsaconian district, and of the life and manners of the people. This is to be ready in May of this year. The subscription price is twenty francs ; after publication the price will be raised to thirty francs. Dr. Deffner's address is Rue de l'Académie 29, Athens.

—Wagner's famous comparison of an Italian opera to a concert in costume was never more literally justified than by the performance on Monday evening of "Traviata" at the Germania Theatre. When Madame Patti appeared in this city some time ago on the concert stage, without costume, tickets were at a discount. Everybody wanted to hear her in opera, and in opera alone. A clever manager took the hint, hired a theatre with its scenery, picked up a few singers and instrumentalists, held a few rehearsals, announced his dates, and everybody flocks to hear "Patti in opera." And yet nobody has heard Patti in opera. Even the uninitiated must have known that no respectable opera company can be formed in a few weeks, and that hardly one of the vocalists engaged to assist Madame Patti is worth a row of pins. Alone, alone, all, all alone, she floated on a sea of monotonous and often discordant sounds, and neither her beautiful voice nor her refined phrasing and perfect execution of florid and melodious passages could arouse any genuine enthusiasm in the audience. There were some calls before the curtain and an abundance of flowers, but no encores; and probably few spectators were sorry when it was all over. The advantage gained by seeing Madame Patti in costume, and by the opportunity of estimating her powers as an actress, was fully neutralized by the disadvantage of having to listen to all the dreary work done by the rest of the company ; and Madame Patti, in spite of her mercenary aims, is yet too much of an artist not to be influenced, both physically and mentally, by such surroundings. The quality of her voice and her style of singing were fully characterized by us on occasion of her first concert, and we need therefore only add a word or two as to her conception of the part of *Violetta*. *Violetta's* name is Adelina Patti, and Adelina Patti is fond of jewels and trailing dresses, and does not succeed in reproducing emotions and pathos in such a manner as to affect the spectator. She is more successful in gay and playful characters than in tragic rôles, although she is said to prefer the latter. One thing we liked about her acting, and that was the absence of that exaggeration and affectation so common to Italian artists ; and she also deserves credit for not responding to ill-timed applause in the pathetic situation in which *Germont* leaves her after exacting the promise that she will renounce his son. Many years ago her friend Dr. Hanslick pointed out to her the absurd contradiction of the "*nuance*" of repeatedly introducing the cough of a consumptive patient while at the same time making a vocal display of the power of her lungs. This *nuance* she still stubbornly insists upon ; but we noticed it only once. Mention must also be made of the marvellous chiromantic powers of the Gypsies who in Scene x. Act ii. foretold the fortunes of *Flora* and the *Marquis* by inspecting the palms of their kid-gloves.

—Mme. Gerster appeared at Booth's Theatre on Wednesday week, in "Sonnambula," as *Amina*, which by many is regarded as her best rôle. The art which enabled her to assume the appearance of girlish simplicity and artlessness in the early part of the opera, no less than the refined portrayal of despair and pathos in the later parts, would have convinced any one not convinced before that she would have made her mark as an actress, had not the gift of a beautiful voice made it incumbent on her to become a prima donna. As Bellini's melodies are a much nearer approach to genuine inspiration than Donizetti's, she had a better opportunity, too, than in "Lucia" to infuse into her notes that emotional warmth which shows that they come "not from the chest alone, but also from the heart." Her vocalization, however, regarded from a purely technical point of view, was in the florid passages open to criticism. Her staccato notes have not the silver-bell purity and bird-like spontaneity of Patti's, nor is her trill so perfect in rhythm and intonation, and her rapid legato passages are sometimes slurred in a reprehensible manner. The fact that, nevertheless, precisely these passages were most enthusiastically applauded, shows how uncritical those audiences are which still cherish the old Italian opera. But we admire Madame Gerster none the less for these shortcomings in the execution of florid passages. These are but the theatrical embellishments of music—the powder on the face of a fair actress. It is the poetic contents of the melodies, their sensuous and emotional beauty that Madame Gerster succeeds in reproducing in a manner equalled by few living vocalists; and herein lies her true greatness. We shall remember three or four of her sustained notes of this evening as among the most beautiful we have ever heard; and we have heard a great many.

—While Handel's oratorio, "Israel in Egypt," has long been familiar to Bostonians through the performances of the Handel and Haydn Society, it had its first performance by the Oratorio Society, under the direction of Dr. Damrosch, on Saturday evening, in Steinway Hall. The greater attention which in Boston has for years been devoted to choral works was probably in some way connected with the inferiority of the local orchestras; but now that New York has been placed on a basis of competition through the rival efforts of the Oratorio Society and the New York Chorus Society we shall probably soon be able to claim preëminence in this department also. The performance of "Israel in Egypt" by the former society was, of course, by no means equal in merit to the recent performance of the "Messiah," since this is a work of which every bar is as familiar to the singers as Old Hundred. The ease and animation that can only be acquired through years of familiarity were absent, and the general impression given by the work was accordingly more wearisome than the character of the music warranted. The most notable exceptions to this statement were the chorus, "He sent a thick darkness," and the one immediately preceding, "He gave them hailstones for rain," which was so brilliantly executed that it was redemanded. In the first chorus of the second part the sopranos were shockingly out of tune, and there were various minor imperfections which it would be tedious to record; but nevertheless, taken as a whole, the performance of this difficult oratorio reflected credit both on the Society and its director. Of the soloists the only ones that deserve unstinted praise were Mr. Winch, from Boston, and Miss Henne. Mr. Remmertz's voice was rough, husky, and forced. The edition of the score chosen for performance was that edited by Mendelssohn in 1844 for the Handel Society in London, with the addition of the three trombone parts discovered by Chrysander and published in a later edition. In spite of the extravagant praise that has been bestowed on "Israel in Egypt" by Chrysander and Chrysanderites, we are not at all convinced that it is an art-work of the highest order. There are indeed in it numbers that rank with the finest creations of Handel and his successors in this department of music. But the first condition of a great work of art is an organic unity—a correlation of the va-

rious parts showing unmistakably that they belong to one and the same tone-body, as is the case, for example, with Bach's Passion music, Beethoven's Fifth Symphony, and Wagner's "Tristan and Isolde." Such an organic unity cannot be claimed for "Israel in Egypt," and it would be very strange indeed if it did exist, in view of the fact that not a few of its numbers were borrowed from other works of a totally different character, whether Handel's own or those of other composers—for Handel, it is well known, was a sort of musical Dumas in the way in which he plundered other people's orchards. In Mr. Dwight's analysis of this oratorio, which was printed at the head of the programme, nothing is so amusing as the enthusiastic language in which this arch enemy of programme music dwells on Handel's success in depicting the "small plague" of the frogs and the flies—a conception which no other composer could have handled "with any hope of not coming off flatly ridiculous." As "Israel in Egypt" is on the programme of the May Festival, more need not be said of it at present. Instead of the whole work, a selection of the best choruses, omitting the others and all the recitatives and airs, would be more enjoyable.

VOLCANOES.

Volcanoes: What They Are and What They Teach. By John W. Judd, F.R.S., Professor of Geology in the Royal School of Mines. [International Scientific Series.] New York: D. Appleton & Co. 1881.

No phenomenon in nature is so fitted to make a profound impression upon the mind of man as a volcanic eruption. It is a perilous spectacle, but the danger is seldom so imminent as to preclude an appreciation of its strangeness and sublimity. The conditions with which habit makes us familiar are reversed. The solid earth trembles, mountains may grow before our eyes or crumble away, the rivers are liquid fire, the clouds rain stones and scoriæ; and of familiar appearances only the lightning, otherwise so transient, hovers lingeringly about the centre of action in a congenial atmosphere. To the superstitious, eruptions have furnished images of horror which the imagination has been unable to surpass. Reason does not abate, but only gives a new direction to the interest which volcanoes excite in the untutored mind; for eruptions past and present offer almost the only opportunity for direct inquiry into the present condition of the earth at considerable depths below the surface, and of drawing inferences as to the earliest history of the globe. No better subject, surely, could have been chosen for a popular book of science, and Prof. Judd has written one which depicts and analyzes the phenomena in so graphic and vivid a manner that no one, to whom the contemplation of nature is not positively repulsive, can fail to find his interest sustained to the end. The almost certain popularity of the book renders it unnecessary to sketch its contents in detail, but makes it all the more important that the author should be held to a somewhat rigid accountability for the positions he has taken.

In spite of the interest which volcanoes have always excited, it is only within about half a century that any considerable advance has been made in elucidating their nature. Vulcanism embraces three grand divisions: the phenomena of eruptions, which are matters of observation and record; the products of eruption, of which the chief are the so-called "eruptive rocks"; and finally the causes of eruption, which lead to some of the grandest and most difficult questions in natural philosophy. Mr. Judd's descriptions are most excellent. Many of them are from personal observation; and from the large amount of literature on the subject he has selected further illustrations very happily. The least admirable portions of the book are those which deal with eruptive rocks. It is neither to be expected nor desired that the author of a popular book should lay aside his own peculiar views and present a mere colorless report on the opinions of other authorities. But the object of a popular treatise on geology is nevertheless to give an account of the views prevailing among specialists on the subject in hand; and when the author maintains peculiar hypotheses, it should be clearly indicated that he and not the body of his fellow-workers is responsible for them. In his lithological discussions Mr. Judd has failed to observe this evident principle. On page 211 occur the following sentences:

"In the same dyke or sheet, when it is of great width, we often find every variation—from a glassy material formed by the rapid cooling of the mass where it is in contact with other rocks, to the perfectly crystalline or granitic varieties which form the centre of the intrusion."

"One material is found, under varying conditions, assuming the characters of obsidian, rhyolite, quartz-felsite, or granite; another, under the same set of conditions, taking the form of tachylyte, basalt, dolerite, and gabbro."

Taken in connection with other passages (pp. 139–143), it is certain that Mr. Judd means to assert that he has observed, in a single dike, rhyolite passing into quartz-porphyry, and this again into granite. If a reader making his first acquaintance with vulcanology through Mr. Judd's book were to turn to any one of a number of text-books on geology for further information on this transition, he might be startled to find it stoutly maintained that granite is not an eruptive rock at all, but a result of metamorphism at a comparatively low temperature. No question in geology has caused more discussion, or is apparently further from a final settlement, than that of the genesis of granite.

The science of lithology has been revolutionized during the past dozen years by the introduction of the study under the microscope of extremely thin, translucent sections of rock as a working method of determination. Although field observation still is, and must always remain, an indispensable portion of the study of rocks, lithology has thus become a branch of applied physics. Though microscopical lithology is far from a perfect science, it has been so zealously pursued, especially in Germany and France, that very definite and well-established results have been reached. Its students have almost unanimously come to the conclusion that there is a large number of rock types or species of a very definite character, while exceptional occurrences manifest the peculiarities of more than one species, as if they were mixtures. One of the extraordinary facts developed by the study of hundreds of thousands of sections is the persistence of rock types throughout the world to their minutest details. A typical volcanic rock (say an angite-andesite) from the Sierra Nevada is often wholly indistinguishable from a specimen of the same rock collected in Transylvania or in New Zealand, even when the minutest and seemingly most fortuitous points of microscopic structure are compared. This persistence, which extends to all the more important rock species, is far more wonderful than any well-established and generally-conceded instances of mixture or transition. Among such instances is none which compares most distantly with the dikes Mr. Judd so often meets. A dike consisting of granite at the centre, enclosed by quartz-porphyry, and this again by rhyolite, involves no less than five transitions between rocks which elsewhere exhibit well-marked individuality, considerable differences in mineralogical composition, and genetic indications of great diversity. It is evident that only the most skilful application of the most rigid methods of determination will suffice to procure the general acceptance of so paradoxical a result.

The space which Mr. Judd devotes to the subject is unavoidably far too small to permit of the necessary amount of proof, and even the few indications of his methods which he gives do not altogether tend to inspire confidence. He speaks of the union of microlites to "skeletons of crystals," and asserts that, "by the filling up of the empty spaces in these skeletons complete crystals are built up." Skeleton crystals, either natural or artificial, are no novelty, but their endogenous growth is not a familiar fact. Mr. Judd speaks of "embryo microliths and perfect crystals"; and, again, he says, "we have a glassy ground-mass containing microliths (a 'crypto-crystalline base')." It is a pity that these expressions were not more carefully chosen, for they would almost lead to the conclusion that Mr. Judd failed to realize the nature of crystallization, which is a matter of molecular arrangement, not of external form. Nor are his remarks on decomposition altogether satisfactory. If, for example, as he suggests, the absence of leucite in the older rocks were due to the conversion of this mineral into other members of the feldspar group, the secondary feldspar would retain the external form of leucite, and the replacement would not escape careful observation in a moderately well-preserved rock. In short, better sustained as well as fuller proof of the identity of obsidian and granite is indispensable to the acceptance of the assertion as a statement of fact.

Mr. Judd's résumé of the views now prevalent with regard to the condition of the interior of the earth is clear and impartial. The immediate cause of the ejection of lavas, he and others seek in the absorption of different gases, especially of steam, by melted rock-masses. It is well known that certain metals, as well as sulphur and perhaps other substances, absorb many times their own volume of gas when they are fused, and that this absorption is promoted by pressure. When the pressure or temperature is diminished to a certain degree, this gas is again liberated, and often explosively. Mr. Judd cannot be said to misinterpret the general opinion of geologists in asserting that "it is to the violent escape of these gases from the molten rock-masses, as the pressure upon them is relieved, that nearly all the eruptive phenomena of volcanoes must be referred." It is somewhat difficult, however, to account for the relief of pressure, and observers are not wanting who deny that the escape of gases is an invariable accompaniment of eruptions. Mauna Loa, the greatest active volcano of the present time, is said to form such an exception, and some authorities consider the part played by absorbed gas a subordinate one.

The greater number of geologists have held that, while the known eruptions of the present time are confined to narrow vents or chimneys leading to the surface, eruptions in past geological ages have taken place in great part through fissures of considerable length, and have been accompanied by comparatively little explosive activity. The evidence of this is familiar to all who have examined the eruptive rocks of the western portion of this continent. It consists in the structure of the rock-masses and in the comparative absence of pumice, volcanic ash, etc. Mr. Judd's views on this subject are those of an extreme uniformitarian. In his opinion, all eruptions occur on fissures, but these are closed against the passage of ejecta except at certain points. He is, however, wholly unwilling to admit that the conditions now prevailing on the

surface of the earth can ever have varied during countless millions of years, even as to the extent to which volcanic fissures were obstructed; and he ascribes the failure to find the channels which supplied the eruptions of the ancient volcanoes, in the districts where the occurrence of massive eruptions has been asserted, to lack of care in examination. The absence of pumice, etc., he accounts for by denudation, yet the most delicate organisms have been abundantly preserved. Mr. Judd, indeed, states that scoriæ have occasionally been found in the Cambrian; but suppose it granted that there were explosive eruptions in pre-Tertiary times: does that prove that there were no massive outflows?

Geologists often take little interest in mineral veins, which are usually more or less directly connected with volcanic phenomena, and which possess as much scientific interest as economical importance. Considering, however, that Mr. Judd's chair is at a famous mining-school, his few remarks on the subject must be considered as somewhat naïve.

American readers outgrow in their early youth any touchiness with regard to the geography of their native land; but as this charming volume deals so largely in geographical matter, and will undoubtedly go through several editions, it may not be superfluous to note that Baron von Richthofen has written nothing on any region within 500 miles of the Rocky Mountains, and that the Yellowstone Park is a long distance from Colorado. "The great Comstock lode, in the Western Territories of the United States," too, might be more precisely placed; for, great as it is, it does not extend beyond the limits of a single State. Though, as has been explained, Mr. Judd's 'Volcanoes' is not a faultless book, comparatively slight alterations would suffice to correct its errors; while as an animated, and in most respects admirable, account of some of the greatest marvels of nature, it can be read with both pleasure and profit.

MEMORIAL HISTORY OF BOSTON.—VOL. IV.

The Memorial History of Boston, 1630–1880. Edited by Justin Winsor. 4 vols. quarto. Boston: J. R. Osgood & Co. 1880–81.

THIS volume completes the most extensive work of local history which has been attempted in this country, the four volumes containing 2,734 large pages, while a space not far from the equivalent of 300 pages is filled with illustrations in the text, in addition to the numerous heliotypes, which increase the number of leaves, and are not included in the above enumeration of pages. The work was completed in print in about twenty-three months from the first organization of the service upon it; and this staff consisted of nearly seventy writers, who, with engravers and printers, acted under the supervision of an editor, who had for counsellors a committee consisting of the Rev. Edward E. Hale, D.D., Dr. Samuel A. Green, and Charles Deane, LL.D.—all well-known historical students. Although Dr. Green has since been chosen Mayor of Boston, the auspices of the city as a corporation were in no way involved, the enterprise being strictly a private one, placed upon its business basis by Mr. C. F. Jewett, who had had some experience in publishing county histories. The occasion of the quarter-millennial celebration of the foundation of the city in 1630, which naturally incited in its people a review of their town's history, the recognition of nearly all the names among its contributors as being those of persons versed in the subject, together with the promise of the first volume, not gainsaid by the quality of the succeeding ones, have all contributed to make the experiment noteworthy; and the sale so far of nearly fifteen thousand volumes, or thirty-five hundred sets, has proved that a sufficiency of buyers can be found for an expensive book which can both create and satisfy a demand.

The auspices were doubtless favorable for making what may be called a new departure in the writing of history. In its coöperative character it was certainly not unprecedented. Cyclopædias, and even histories—like those of counties where different writers undertook each a town—had been tried not infrequently before, and the method was a familiar process. But to arrange the parts of one story so that special study at the hands of a recognized authority should develop this epoch or that episode, and each part supplement the others without essential omission in any, was never, we think, executed before on any scale commensurate with this. To do this, and do it well, required a body of trained writers, each familiar with his subject and not unfamiliar with his neighbor's. It was an advantage, too, that they knew each other in the councils upon historical matters which, under the auspices of the Massachusetts Historical Society, the American Antiquarian Society, and the New England Historic, Genealogical Society, are things of not infrequent occurrence in Boston. It was essential too that, besides having a reciprocal confidence in each other, they should feel a ready dependence upon their editor, even in his moods of heroic intercession, so to speak, and could submit without demurring to his control and direction. It is perhaps not too much to say that nowhere in America so well as in Boston could these conditions be readily found; nowhere else are the ties of literary association, which conduce to it, so perceptible and to be depended upon. Add to this an historical record to be worked over, which is of singular attractiveness, as all records are which cluster about ideas, even though they be unsavory ones (as many of those centring in Boston are to this generation), and we have another powerful help to this scheme.

It has happened that the annals of Boston and Massachusetts have been made conspicuous by a variety of causes. The attention which their own writers have paid to their story, and in no small degree its typical character, have served to produce this prominence. Then again even national events have been closely connected with their local chronicles. It is a clear succession from cause to effect, step by step, which makes, for instance, the Declaration of Independence the sequel of the incipient struggle against prerogative which was heard almost with the first footfall on the Boston peninsula. It may be that Virginia, let us say, sent greater patriots to Philadelphia than Sam Adams, but by him more than by any one else was independence organized. Toleration in Maryland represents an idea dearer to this generation than anything that came of the theocracy in New England, and there was not a little of the light and shade of romance about St. Mary's and Kent Island; but its story does not interest like the Boston story, notwithstanding all that there was of repulsiveness in the latter. And why? In part, doubtless, because it has not been so dwelt upon, and because the number of writers who lead the public have been far fewer in Maryland than in Massachusetts, but largely because of the actors themselves in the two scenes. It all traces back to the schoolmaster. The New England people wrote books, diaries, and letters, and poured their thoughts and manner of living into them, and they have been preserved. It is these things that fill the canvas and make a history interesting—not laws, charters, and official reports. Of the beginnings and progress of Boston we know very much in this way—of no other American city so much. Such, then, were the promises of a proved success.

In noticing the previous volumes we have given some enumeration of their contents, and will do the same by this last of the series. The two divisions of the volume are, first, the continuation of the different phases of the history and life of the last hundred years; and, second, a series of special essays, embracing topics which seemed better treated historically, as covering the whole range of the period gone over in the book, than by divisions of time.

The subject of the social life of the town, following the Revolution and going on through the Federalist period, is taken up by Josiah P. Quincy, and is illustrated by diaries and society-letters now brought out from family desks. The changes which the last hundred years have made in the externals of Boston are traced by Mr. Edward Stanwood, the new editor of the Boston *Daily Advertiser*. Colonel Wright, the State Statistician of Massachusetts, explores the growth of the industries of the later generations. Mr. Edward Atkinson, almost of course, tells of Boston as a centre of manufacturing capital. Charles Francis Adams, jr., traces the somewhat erratic development of Boston enterprise in canals and railroads—slow at home, but pushing at a distance. The monetary leaders in Boston, Messrs. Kidder & Peabody, tell the story of finance in Boston. The changes in methods of underwriting are followed by the Secretary of the Underwriters' Union, Mr. Osborne Howes, jr. Mr. Hamilton A. Hill, formerly Secretary of the Boston Board of Trade, recounts the story of those proud days—not equalled now—when the private signals of Boston merchants were seen in almost every foreign port.

Coming to the "Special Topics," the first is naturally that of "Education, Past and Present," described by Charles K. Dillaway, whose name is associated with the history of the Boston Latin School. The libraries of Boston are followed down from their beginnings by the editor himself. The growth and outcome of Boston Transcendentalism was assigned to the late George Ripley, who was at work on his chapter when he died, and Mr. George P. Bradford has completed it. Mrs. Ednah D. Cheney, the only lady on the staff of contributors, has naturally "The Women of Boston" to discuss. The historian of the Boston stage, and the most devoted of its daily chroniclers, Col. William W. Clapp, of the Boston *Journal*, discourses of the drama in Boston. What has been done in the fine arts is told by Arthur Dexter; in music, by John S. Dwight; in architecture, by Charles A. Cummings; in science, by Professor Lovering, the President of the American Academy; and in medicine, by Drs. Green and Oliver Wendell Holmes. Mr. John T. Morse, jr., brings before us the magnates of the Boston bench and bar; Col. Marshall P. Wilder depicts what Boston and its suburbs showed for gardens in past years, and what contributions to pomological science they have so prominently made; and, finally, the somewhat wonderful story of the "Charities of Boston" has been told by one whose name is linked with the organization of this service in Boston, Mr. George S. Hale.

The same wealth of portraits, views, maps, and autographs as in earlier volumes is bestowed upon this, and a full general index renders all more valuable and accessible.

A PENINSULAR VETERAN.

Letters and Journals of Field-Marshal Sir William Maynard Gomm, G.C.B. From 1799 to Waterloo, 1815. Edited by Francis Culling Carr-Gomm. London: Murray.

Sir William Maynard Gomm lived to the mature age of ninety-one; but in presenting a portion of his letters and journals to the public, the editor has exercised a wise discretion in limiting himself to those which refer to the great Napoleonic wars: "One crowded hour of glorious life is worth an age without a name." In the character of Sir William Gomm himself there was nothing sufficiently remarkable to justify a record of his life; but the first fifteen years of his long military career were passed amid a succession of exciting and perilous adventures, which would give attraction and interest to the most commonplace of men. Entering the army when he was only fifteen, he found himself at the age of thirty Sir William Gomm, K.C.B., and Lieutenant-Colonel of the Coldstream Guards. Those were days of rapid promotion for the soldier who had the luck to carry a charmed life amid the multitudinous perils of the battle-field. Such an one was Sir William Gomm.

His baptism of fire was in the expedition to the Helder, under Sir Ralph Abercromby. He was present at the combat of Roliça and the victory of Vimiera, under Sir Arthur Wellesley. He shared in Sir John Moore's retreat, and commanded the guard which attended when the English General was laid in his last bed on the ramparts of Coruña, and, like all who served under that peerless soldier, Sir William Gomm had a warm admiration for his great and chivalrous character. He participated in the ill-managed and disastrous Walcheren expedition, and after that he was transferred to Spain and the army under Wellington. Of all Wellington's victories in the Spanish campaign, Talavera and Toulouse were the only ones at which Gomm was not present. He was present at the battles of Busaco and Fuentes de Oñoro; he bore an active part in the storm and capture of Ciudad Rodrigo and Badajos; he was in the very thick of the great battle of Salamanca; as Quartermaster-General to the division under command of Sir Thomas Graham, he conducted that force through the passes of the Tras-os-Montes, and took a conspicuous part in the crowning victory of Vitoria; he was present during the siege and blockade of San Sebastian, present in all the hard fighting among the valleys and defiles of the Pyrenees; he was at Quatre Bras, and passed, without so much as a graze, through the memorable 18th of June.

Experiences such as these lie so utterly outside of the track of ordinary existence that it is impossible not to feel an interest in one who has encountered them. A man whose business it has been to look death in the face, without quailing, for the space of sixteen years must, we are apt to imagine, have learned many things regarding the mystery of human life from which the world in general is cut off. Actually, however, these expectations are seldom realized in the biographies of soldiers. Nor is this strange. The men in whom the reasoning and reflective qualities are active and strong—who are careful to preserve their individuality, and value independence and originality of thought—are naturally the men who turn aside from a military life as the one, of all others, most unsuited to themselves. It is the active, unreflecting spirits—the men who can receive with unquestioning faith the conventional morality and the popular politics of the time—who accept commissions in the army. They experience no difficulty in making over their consciences to the keeping of the superior military authorities, and are ready to shoot anybody at the word of command, without asking if he has done anything deserving of death. Sir William Gomm was the most amiable and kind-hearted of men in all his domestic relations, but the "horrors of war"—provided that they were perpetrated by British troops—appear to have affected him no more than the firing of so much blank cartridge. It is different when the French are concerned. When they plunder and burn, he is excited to the liveliest indignation, and cries out that "the age of chivalry is gone," and that the French are "worse than Huns," and "have traced back every step that nations make toward civilization." This refers to the retreat of Massena's army from before the lines of Torres Vedras; but subsequently, when he has to tell of the unspeakable horrors which followed when British soldiers were sacking the town of Badajos, he describes them in this delicate fashion:

"Then followed the plundering scene, which was a jumble of all that was horrible and ridiculous. Our soldiers cannot shed blood when the occasion calls for it with half the enthusiasm of other people; but they enter with spirit into every other species of extravagance that they are tempted to by being placed in these situations, and when brutalized by drink they blunder into horrible absurdities."

What Sir William Gomm describes as "extravagance" and "absurdity" is said by the historian of the Peninsular War to have been "shameless rapacity, brutal intemperance, savage lust, cruelty, and murder." The fact was, that Sir William entered into this conflict with the simple and irrational belief that was characteristic of the immense majority of English gentlemen at that time. He regarded the struggle against the French Revolution as a sacred war, in which all the culpability was to be found on one side, and all the virtues on the other. The French Revolution was, in his estimation, simply an outburst of human savagery against a most chivalrous and beneficent order of things, and he appears to have expected to find in each individual Frenchman an incarnation of all the vices and the crimes which he attributed to the Revolution. When he is first brought into contact with this savage people, his surprise is considerable that his anticipations have not been realized. He writes apologetically to his sister upon the subject: "You will," he says, "think me a curious being for making such a confession; but I really cannot help telling you that the lower orders of them (I mean the soldiers) appear to me very amiable. They are civil, obliging, and gallant to a degree, and I don't believe half the stories that are told of them." But the effect of this first *rencontre* appears to have been speedily obliterated. He describes them shortly after as "worse than Huns"; and when he learns that Napoleon has abdicated, and that the Bourbons are about to be restored, his feelings are almost beyond the reach of words. "I have felt," he writes, "as if some piece of great good fortune had befallen me—something that was to brighten the prospect of all my future life. . . . *I think the restoration of France to order, and to its proper political place among the commonwealths of Europe, is like the redemption of man from a second fall.*" The man, said Canning, who says he likes dry champagne is capable of saying anything. The man who could bring himself to believe that the restoration of the Bourbons to the much-enduring French people was like the redemption of man from a second fall ought (to paraphrase a remark of Lord Beaconsfield's) to be made to drink dry champagne for the rest of his life.

It is, however, hardly fair to test the character of a soldier by his opinions on general politics, and, from a purely military point of view, there is much to admire in the character which is disclosed to us in these letters and journals. This is the third biography of a Peninsular soldier which has recently been published. The two preceding ones were those of Gen. Sir Thomas Graham and Lord Clyde (Sir Colin Campbell); and now, comparing the three biographies together, the reader is struck by the various characteristics in which the heroes of them resemble one another. If there were many such men in the armies under Wellington, the secret of his almost unvarying success is in a great measure explained. There was nothing which contributed so powerfully to the expulsion of the French from Spain as the bitter dissensions amid the French marshals. At Fuentes de Oñoro the British army may almost be said to have been saved from defeat by the flat refusal of General Reynier to carry out the orders of Masséna; and Wellington could not have driven Soult across the Pyrenees if Suchet had not obstinately refused to coöperate with or in any way assist his brother-Marshal. This spirit of unscrupulous egotism is at once the offspring and the ultimate destroyer of a system of military imperialism. Under such a system devotion to an individual is made the ruling principle of action, to the sacrifice of loyalty to the country or obedience to the laws; and the consequence was that where Napoleon was not himself present to enforce his authority, each French marshal considered himself independent of any other. The egotism of the master was caught up and faithfully imitated by his lieutenants. In contrast to this, what strikes the reader in the character of the English officers to whose biographies we are referring, is their loyalty to their chief and their unquestioning devotion to the common cause. Wellington could count upon his lieutenants for the execution of his orders with almost the same confidence as if he had been executing them himself—a fact sufficient in itself to double his strength in the field.

In addition to this, there would appear to have been, in the British officer of those days, a simplicity and manliness of character which enabled him to achieve great things without the consciousness of doing anything specially noteworthy. The letters in this biography of Sir William Gomm are letters addressed to his sister. They were written from day to day, amid the fatigues and excitements of pursuit or retreat—fresh from the storming of some fiercely-defended breach, or with the thunder of some great battle still sounding in the brain of the writer. Nevertheless, from the first of them to the last, there is hardly a reference to the part played by the writer himself in the great events of which he was a sharer and a witness—hardly an allusion to the perils he was daily passing through, and never a word in complaint of hardships or fatigue. But he is never slack to express his admiration of others, and here and there we get some interesting glimpses of the "Iron Duke" and the chief among his lieutenants. Of Sir Thomas Graham he writes:

"I dined yesterday at Gallegos with General Graham. I do not know whether I have mentioned to you that he had several narrow escapes at this siege [Ciudad Rodrigo]. All the world would say that he exposes himself too much on all occasions, if he did not make such good use of his time while he was exposing himself. He is one of those men who set us in good humor with ourselves, and with the times we live in, as often as we approach them; and while we honor them for their own merits, we feel a secret pride at the recollection that we belong to the same order of being with themselves, and we are glad to witness the elevation of which our nature is susceptible. This is a safe sort of vanity, and such men do more good among us than they ever calculate upon."

Here is his account of Salamanca:

"Never, I believe, was success anticipated to the degree that it was in the English army when the advance was ordered. Had an indifferent person come among us while the French were continuing the heaviest of their cannonade upon us, and observed our soldiers preparing for the advance, he would have said: 'Whatever these men are going to attempt, they *must* succeed.' The scene, too, was of all others the most animating. The country was such that the fifty thousand men of either army could move in all directions, and from many points be in view almost at the same moment. . . . The destructive fire of the French artillery grew more deadly as we approached it. But the spirit of our people rose in proportion, and when they reached the enemy's solid columns, which opened a fire like a volcano upon them, there was not a moment's hesitation—no check along the whole line, but a general shout of exultation was echoed from all quarters. The enemy wavered, retired from height to height, till at length it was impossible to withstand the ardor of our soldiers, which seemed to increase with every fresh assault, and complete rout ensued. . . . I have told you on other occasions that, if I had any faith in sorcery, I should incline to think that I bear a charmed life. But I do not thank Heaven with half so much fervor for having suffered me to pass without injury through this day, as for having suffered me to bear a part in more than one of the most important of this day's feats."

Major Gomm (as he then was) was attached to the Fifth Division, by which the battle was virtually won. General Leith, who commanded, had his arm shattered by a musket-ball toward the close of the engagement, and regarding him the gallant and enthusiastic Major writes as follows:

"General Leith is surpassing our most sanguine expectations in the promise he is giving of a speedy recovery. . . . At headquarters they are full of his praises; he was the Bayard or Gaston de Foix of this battle, 'the observed of all observers'; he threw a truly chivalrous spirit into all those who were about him. The wits say that while he was advancing he looked like the presiding spirit of the tempest; his division the thundercloud that he rolled after him; and his staff were flashes of lightning that he scattered about him."

The battle of Waterloo was the last of Sir William Gomm's battles. The remaining sixty years of his life and his military service were passed in the discharge of peaceful duties. The last position of importance that he filled was the Commandership-in-Chief of India. His five years' tenure of this charge constituted one of the few and brief intervals of peace which are to be found in the annals of British rule in India. It was destined to be broken by the mutiny of the Sepoy army, and the rebellion which followed it. Sir William laid down his command almost on the eve of this catastrophe, which was as little anticipated by him as by men of larger experience of India, and greater knowledge of its people. He handed over the Bengal army to his successor with an emphatic eulogy on the discipline and assured loyalty of the native regiments. Four months later a small body of British troops were desperately clinging to the ridge before Delhi, and daily attacked by thirty thousand rebellious Sepoys. Sir Charles Napier had predicted this occurrence so far back as 1853; but Sir William was not the order of man capable of such feats of prophetic divination. He was a loyal-hearted, courageous, manly soldier, as these letters abundantly show, but he rose to high command, not in virtue of any natural gifts, but by the fortunate accident of being bullet-proof during a stirring period of rapid promotion.

Social History of the Races of Mankind. Fifth division: Aramæans. By A. Featherman. London: Trübner & Co. 1881. 8vo, pp. xvii.–664.

Mr. Featherman comes to the execution of his ambitious task with decided self-confidence and with a well-defined scheme. Man, according to him, came into existence under varying conditions, in different countries, and at different geological periods, and the race now includes six stocks. The Nigritian arose in Africa, the Melanesian in Borneo and the adjacent islands, the Maranonian (American Indian) in the valley of the Amazon, the Turanian in Siam, the Aramæan (Semitic) in Syria, and the Iranian (Indo-European) in Georgia. He gives no reasons for the adoption of this scheme, perhaps reserving his grounds for a later volume. He has selected the present volume as the first of his series for publication because the Semitic nations and tribes "have already attained a high degree of civilization," and "the work will present a high interest not only to scientific men, but to the general reader; while it furnishes valuable information as regards the Semitic question which has recently been raised in Hungary and Germany." We have been unable, however, to get any light from our author on the "Semitic question," and we fear it is only a painful interest his work will excite in scientific men. His procedure is the reverse of scientific. He makes statements of disputed points with the most assured calmness, without hinting that any doubt attaches to them, and generally without assigning any reasons for his statements. He prefers the term "Aramæan" to "Semitic" as a designation of race or stock, apparently on the ground that the Syriac is the oldest of the Semitic family of languages, which is a grievous misconception. In this Aramæan stock he includes the Egyptians, Berbers, and other North-African peoples, and describes their migrations and early history as if all this was an assured fact. He rounds and embellishes all the early periods into symmetry by ungrounded assumptions.

His book is so far an admirable specimen of what such a book should not be. The execution is, however, unequal. His accounts of modern Semitic and other communities, such as the Nestorians, Berbers, Wahabees, Druses, and Falashas are usually correct, being taken from books of travel, though not always from the most recent authorities; but in the history of the ancient nations his lack of thorough acquaintance with the subjects, and his desire to smooth everything into good shape, lead him into so many blunders that this part of the book can hardly be said to be worth anything. In respect to the Phœnicians, along with a good deal that is correct, we are informed that they were the first race of "Syro-Aramæans" who attained a high degree of culture; that through Cadmus they introduced civilization into Rhodes and built a temple to Neptune; that they formed a new nationality (Carthage) on the west coast of Africa; that they adored the secret and inherent forces of nature, and that their religion at its rise was distinctly Sabæan in its ritualistic forms and principles. The linguistic information that our author gives is quite new and very surprising. The Phœnician alphabet, he says, was composed of twenty-two letters, which were delineated in the quadrate form of the Hebrew type, but it originated with the Babylonians, and the language of the Phœnicians formed a connecting link between the Hebrew and the Chaldee; but, as its literature has entirely perished, the nature of its internal construction can never be known with any degree of certainty. In Assyria and Babylon, he further remarks, two methods of writing were in use—the cuneiform, which was of Aryan origin, and a cursive form, strictly alphabetical, whose characters resembled the Phœnician and Hebrew letters, and were undoubtedly of Phœnician or Babylonian origin. Elsewhere (p. 102, foot-note) he adds that the old written characters of the Hebrew language were partly Phœnician and partly Babylonian, and that the alphabetic forms which have come down to us were introduced only after the building of the second temple, and were in use at that time in the provinces bordering on the Euphrates and the Tigris, and are therefore of Assyrian origin. A greater medley of nonsense it would be hard to concoct.

It is a still graver fault that in our author's account of the customs of the Hebrews he utterly neglects historical progression, leaving the unwary reader free to credit the men who came out of Egypt with ideas and usages that belonged only to the generation that lived ten centuries later. He sometimes attains unconscious humor, as when he says that the Hebrews were distinguished for frugality, sobriety, and temperance (one wonders if he has ever read the Prophets), and that the women were far more addicted to flattery than the men. He gravely states (p. 100), as an inference from Ps. xvi. 4, that they were not permitted to pronounce the names of foreign deities. He identifies (p. 89) the John Hyrcanus who conquered the Idumæans (B.C. 129) with him of the same name who called in Pompey to his aid (B.C. 63). Even where he makes no bald misstatement, he frequently gives a false coloring to his description, and this happens so often that we can only caution the reader against the book. It contains a good deal of useful information, but one must watch for errors on every page.

Coffee from Plantation to Cup. A Brief History of Coffee Production and Consumption. With an Appendix containing Letters written during a Trip to the Coffee Plantations of the East, and through the Coffee-Consuming Countries of Europe. By Francis B. Thurber. New York: 1881. 8vo, pp. xiv.–416.

It is between four and five hundred years since coffee first began to be cultivated in Arabia, and for a long time its production and consumption were confined to that country and Persia. The first coffee-house in Europe was opened at Constantinople in 1554. Another century elapsed before it reached western Europe. "The first coffee-house in London was opened in Newman's Court, Cornhill, in 1652, by a Greek named Pasqua Rossie." The first coffee-house in France was opened at Marseilles in 1671; a year or two later one was opened in Paris. It will thus be seen that two hundred years ago the use of coffee in the countries of western Europe had just commenced. Now the average annual consumption of coffee in the non-producing countries of the world considerably exceeds a thousand millions of pounds. No trustworthy statistics—in fact, in most cases no statistics at all—can be obtained of the amount of coffee consumed in the countries where it is produced. Hence all our statements in regard to the consumption of coffee must be understood as referring to non-producing countries.

The Hollanders are the greatest coffee drinkers in the world, their annual consumption being about 18 lbs. per head of the whole population. The principal cause is the fact that Amsterdam has long been one of the great coffee marts of the world, and, being admitted free of duty, coffee is very cheap. Next come Belgium and Denmark, in which the consumption per capita is about half that of Holland. Next come the United States, in which the consumption per capita in 1880 was 8.8 lbs., in 1881 somewhat less, being 8.4 lbs. per head. By a calculation founded on the data furnished in Mr. Thurber's book, the present consumption of coffee in the United States may be stated at a little over one pound per week for each family in the nation. In the use of tea and coffee the people of England and the United States present a most remarkable

contrast. The annual consumption of the people of England is just about a pound of coffee per head, or about one-eighth of that of the people of the United States. Comparing the consumption of tea with that of coffee, it will be found that while the people of the United States use about five pounds of coffee to one pound of tea, the people of England use five pounds of tea to one pound of coffee.

There are fashions in coffee, as in almost everything. Mr. Thurber gives many curious examples, of which we have room for only one. In his chapter on Mocha coffee he says (p. 62):

"At Aden and Alexandria the coffee is carefully picked over and assorted in compliance with the singular fashion in trade which creates a demand in Europe for the larger beans, while the United States will have none but the smaller ones. In point of fact, the larger beans are the best, being fully developed and more perfect both in appearance and flavor."

The whole amount of coffee consumed in the United States in 1880 was, in round numbers, 440,000,000 pounds. Where does it all come from? Probably in regard to no question of fact is there such widespread popular delusion as to this. If all the retail grocers in the United States were to be asked of what kind of coffee they sold most, undoubtedly a large majority of them would answer, "Java." Mr. Thurber's statistics, taken from the official returns of custom-house officers, afford the means of answering the question correctly. If we include under the general name of "American coffee" the coffee produced in South and Central America and the West Indies, it will be found that in the year 1880, of the 440,000,000 pounds entered for consumption more than 360,000,000 pounds, or nearly five-sixths, was American coffee. Of this enormous amount 259,000,000 pounds came from Brazil; in other words, more than four-sevenths of all the coffee used in the United States is "Rio"; but nearly all is sold and consumed under some other name. Mocha coffee is very generally considered the finest, and large quantities are sold under that name at a price higher than ordinary. The whole amount of coffee imported into the United States under the name of "Mocha" in the year 1880 was 4,535,040 pounds. Of this not more than two and a quarter millions of pounds was genuine, the rest being coffee imported into Arabia from other countries and then exported to the United States as "Mocha." It will be seen that the amount of genuine Mocha imported into the United States is about one pound in two hundred of the total import. Practically this is all consumed in the great seaports where it is imported and in their immediate vicinity. Thousands of retail grocers in the United States sell, and their customers use, what both believe to be genuine Mocha. Yet it may be well doubted whether outside of the great seaports there are a hundred grocers who have a pound of genuine Mocha in their stores. But they may comfort themselves with the assurance that the coffee they sell under that name is, if anything, a little better than the genuine article.

The total amount of coffee imported under the name of "Java" in 1880 was, in round numbers, 41,000,000 of pounds, less than one-tenth of the total import; "and yet," says Mr. Thurber, "the fragrant Java is the favorite berry throughout a large part of the United States, and every storekeeper in sections where it is in favor believes he has the genuine article. If we deduct the low grades of Java imported, we discover that a very small quantity of fine brown old Government Java is consumed in the United States." Nevertheless, the reader may enjoy his coffee in peace, and comfort himself with the assurance that the deception is in name rather than fact, and that the average quality of the coffee used, apart from adulteration with other substances, is quite as good as if it were all truly labelled. We leave statistics with the remark that a little over one-half of all the coffee consumed in the world is produced in Brazil.

Mr. Thurber treats very fully of the adulteration of coffee, and gives many recipes which may be used by dishonest grocers, or by honest consumers who may prefer to adulterate their coffee themselves. There is one absolutely certain rule to follow for those who are willing to buy the adulterated article: Buy handsomely-labelled packages of ground coffee. You will never go wrong: they are, without exception, adulterated. There is only one equally certain rule to secure pure coffee: Buy the bean, and grind it at home, or have it ground by the grocer in your presence. It is of course safer to roast it also yourself, but adulteration of the roasted coffee before it is ground is so easily detected that it is almost never attempted.

We have room to notice but one more point, but that is the most important: how to make a good cup of coffee. Of course a good quality of the coffee bean and thoroughly clean utensils are indispensable. Then there are three requisites to perfection—namely, that it be fresh roasted, fresh ground, and fresh made. Mr. Thurber gives a large number of recipes, accompanied with instructive comments. We give two: Into a large cup of coffee ground moderately fine break one egg with shell; mix well, adding enough cold water to wet the grounds thoroughly; pour on a pint of boiling water; boil slowly for ten or fifteen minutes; let it stand three minutes to settle; pour through a fine wire-sieve into a warm coffee-pot. This will do for four persons. This is the "Thurber recipe." The following method is due to that "king of cooks" Soyer. If simplicity is an evidence of genius, it is worthy of its author: "Put two ounces of ground coffee in a stew-pan set on the fire, and stir with a spoon until quite hot. Pour over a pint of boiling water; cover over closely for five minutes; pass it through a cloth, warm again, and serve."

Mr. Thurber's chapter on the chemistry of coffee contains nothing new; neither does he present any systematic treatment of its effects on the human system. It is, however, evident from scattered remarks, and from his chapter entitled "The Tropics' Best Gift," that he is himself very fond of this "fragrant infusion," and regards its use as healthful. The book contains a great mass of statistics, the more trustworthy because evidently not compiled for the purpose of supporting any particular opinions.

Original Portraits of Washington, including Statues, Monuments, and Medals. By Elizabeth Bryant Johnston. Boston: J. R. Osgood & Co. 1882. 4to, pp. xxii.–257. 32 plates (mostly heliotype).

THE first thought suggested by a collection like this is of the small dependence to be placed on contemporary judgments of portraiture. We cannot, indeed, adopt the opinion of any eminent person familiar with Washington's features without rejecting testimony equally respectable in opposition or exclusion. The chances that Custis's and Marshall's and Jefferson's advantages as connoisseurs were outweighed by a natural incapacity for "seeing a likeness," or that Lafayette's ready approval was prompted by the courtesy of his race, combine with the great diversity of the artistic performances themselves to make us doubt whether we can at the present day, by any reasonable induction, determine the real Washington amid so many counterfeits. There is no doubt that in this case, at least, the sculptors are more trustworthy than the painters; and the authoress decidedly pronounces in favor of Houdon's as the standard head. Nevertheless, she herself exhibits very little critical capacity, as will appear from a single instance. What is called the Manley or "Blacksmith's" medal, she says, "demands attention, not only because it was received by contemporaries of Washington as a striking representation of the President, but because it was issued in 1790, and is one of the first medallic works known to have been executed in this country. It is," continues the writer, "doubtless after the head of Washington by Joseph Wright; for the lines are strong and realistic, as was the manner of that artist." Without inquiring whether Wright had a monopoly of "strong and realistic lines," it is to be observed that the three samples of his work here given—a profile drawing and two medallions—are as distinct as possible from the alleged copy, which is strongly prognathous. In fact, if there is any one test better than another of the comparative value of the portraits in this volume, it is the facial angle.

We see this, for example, in the two very interesting paintings made in the same year (1789), while Washington was at the East—namely, Edward Savage's, now in the Harvard Memorial Hall, and Christian Gülager's, now privately owned at Bristol, R. I. There is a strong resemblance between them in the nose, mouth, chin, and in the projection of the lower part of the face, while the total impression produced is by no means the same in each case. These two portraits—with which may be compared for the facial angle the three silhouettes on plate xxi., one being a shadow-picture—we regard as on the whole the most interesting in the book, though Peale's portrait of the youthful Washington (of which a fine heliotype serves as a frontispiece) and the Copley miniature (if it could only be proved to be Copley's) are intrinsically more precious. It appears that the monumental strivings of the American people have resulted in but four equestrian statues of Washington—H. K. Brown's (New York, 1856), Thomas Crawford's (Richmond, 1858), Clark Mills's (Washington, 1860), and Thomas Ball's (Boston, 1869). Of these the first and the last are easily the best.

The various heliotype reproductions are designated by the name of the artist placed below, with a simple reference to the page of the text on which each is described. This seems to us a faulty arrangement, in so far, at least, as the date is not added. In practice we have found it a hindrance to speedy enlightenment, especially as there is no regular or even frequent reference from text to plate. In no one place are we sure of finding date, artist, and present owner explicitly set forth; the table for the plates supplies two of these facts and omits the third. As a rule, the heliotype is from the original canvas, ivory, metal, stone, or paper, but sometimes (as in the case of the Savage Mt. Vernon family group in the Boston Museum) the difficulties of lighting the picture could only have been overcome by electric illumination, and in such instances engravings were resorted to. Whether some such obstacle prevented the portrait in the New York City Hall from being copied, we are not informed. It should be remarked, by the way, that not every portrait catalogued is represented here. Such as it is, with its pleasantly written and gossipy histories and its profuse array of illustrations, this volume will find universal acceptance, and is worthy of the pains that have been bestowed upon it.

The Marriages of the Bonapartes. By the Hon. D. A. Bingham. Two vols. London: Longmans, Green & Co.; New York: Harper & Bros.

BESIDES the variety of popular history which is

most esteemed in this country, and which is designed chiefly for youthful readers with no knowledge of the subject, and written by persons who regard the investigations of scholars as either useless or impertinent, there is a kind, written for English circulating libraries, of which the works of Mr. Hepworth Dixon are the best-known examples. The merits of the Hon. Mr. Bingham's book are chiefly negative, but they are sufficiently numerous to make it an unusually good specimen of its class. It is transcribed from works no more inaccessible than the memoirs of Metternich, Madame de Rémusat, Count de Melito, Victor Hugo, and Lanfrey; but the patchwork is very well done, and the style, though anything but careful, is easy. It would be difficult indeed to make a book which should describe the picturesque and amusing incidents with which the lives of the Bonapartes and their dependents teem and not be entertaining, and the Hon. Mr. Bingham deserves credit for giving his readers much less than is usual of what they would have to unlearn. He does not treat Josephine as a martyr, nor blink the eccentric morals of Hortense. But he certainly praises Eugène more than he deserves, and that gentleman would have been surprised to learn that he indulged in no intrigues after 1814. Louis Bonaparte, on the other hand, gets less credit than he deserves, probably because his merits were political rather than personal. The time-honored fables about the Duke of Reichstadt are not repeated, but neither is the well-vouched-for story of the Princess Borghese and Canova. There are omissions of various other interesting episodes, such as Joseph's life in this country; but, to offset this, it should be said that the story of Miss Patterson is well told, and no attempt is made to show that her marriage was legal, or supposed to be legal, in France.

In a work of this kind one must be satisfied with tolerably true outlines, and not look for accurate details. We have therefore spared the reader an enumeration of the incorrect statements we have noticed, remarking merely on the peculiarities of the honorable author's nomenclature, due apparently to the exclusive following of French authorities. "Caspar Hauser," for instance, is more familiar than is Gaspard Hauser, and we fail to see why the holder of a German duchy should be styled Duc de Leuchtenberg, or German castles and mansions called châteaus.

BOOKS OF THE WEEK.

Koolman, J. ten D. Wörterbuch der ostfriesischen Sprache. Part 14, Lomigheid–Muksen. Norden: H. Braams.
Mackenzie, R. America: a History. Harper's Franklin Square Library. 20 cents.
McCabe, J. D. New York by Sunlight and Gaslight. Philadelphia: Douglass Bros.
Metternich, Prince R. Memoirs of Prince Metternich, 1880-35. Vol. iii. New York: Harper & Bros.
Minor, Ellen E. Murillo. New York: Scribner, Welford & Co. $1.
Mollett, J. W. Meissonier. New York: Scribner & Welford. $1.

HENRY HOLT & CO.

WILL PUBLISH SATURDAY:

John Stuart Mill.

A Criticism. With Personal Recollections. By Alexander Bain, Emeritus Prof. of Logic, University of Aberdeen. 12mo, $1 25.

James Mill.

A Biography. By Alexander Bain, Emeritus Prof. of Logic, University of Aberdeen. 12mo, $2.

C F Bickford 2so 27 1882

The Grosvenor Gallery

LIBRARY,

BOND STREET, LONDON, ENGLAND.

This institution, situated in the best part of London, offers peculiar advantages and attractions to Americans and Colonists. The Reading-Rooms and Reference Library attached are supplied with all American and Colonial newspapers of repute, and the best current literature—British, Foreign, and Colonial. There is an excellent Restaurant, where dinners and luncheons are provided for members at moderate charges, and good Smoking-Rooms are attached, so that strangers visiting England find therein all the advantages of one of the best London clubs.

On the 25th of March next a Register of American and Colonial Visitors will be opened in the Reading-Room, by means of which members coming to London will be enabled to find the names and addresses of their friends in Europe.

Ladies and gentlemen desirous of joining are requested to forward their names, addresses, and subscriptions.

The subscription for members residing in America or the Colonies is £1 1s. per annum, and there is no entrance-fee attached.

TO BOOK-BUYERS, LIBRARIANS, Etc.

JAMES THIN, Bookseller,

55 South Bridge, Edinburgh, Scotland,

Issues periodically Catalogues of Standard and Useful Books in all departments of Literature, Ancient and Modern, which he will be happy to send, post-free, on application.

*** Books not in stock sought after and collected. Gentlemen having lists of books wanted are respectfully requested to send same, and prices, etc., will be reported without delay.

P.S.—200,000 volumes of New and Second-hand Books always on hand.

DAVID G. FRANCIS,

17 Astor Place, Eighth Street, New York,

DEALER IN NEW AND OLD BOOKS.

PRICED CATALOGUES, containing valuable standard literature, as well as rare, curious, and out-of-the-way books, are issued from time to time, and will be forwarded to any address.

BOOKS PURCHASED

OLD POINT COMFORT, VIRGINIA.

THE HYGEIA HOTEL,

Situated 100 yards from Fort Monroe, open all the year. Equal to any hotel in the United States as a Winter Home or Seashore Resort. Send for pamphlet describing hygienic advantages, etc.

H. PHOEBUS, Proprietor.

A Year's Subscription only $3 50.

THE

Magazine of Art.

Price 35 cents Monthly.

Volume I. cannot now be had. Volume II., price $2 50; and Volume III., price $3 50, can still be supplied. Volume IV., being the First Volume of the NEW ENLARGED SERIES, bound in cloth, gilt edges, with *suitable design in ink and gold*, price $5; or Volume IV. and a year's subscription for $7 50. CLOTH CASES for binding Volume IV. will be sent, post-paid, for 75 cents. Parties sending their Parts, prepared, can have them bound in cloth, gilt edges, for $1 50.

No. 1, Volume V., commenced with the December Number, 1881.

WHAT IS SAID OF THE MAGAZINE OF ART.

"*The Magazine of Art*, a publication which has rapidly won its way to an assured and enviable success by the excellence of its articles and the beauty of its wood engravings, in which latter feature it is the best art publication in England or America."—*Boston Journal.*

"The cheapest and best of art periodicals."—*Portland Transcript.*

"Will be looked to more and more by art lovers as the medium between themselves and the creators and thinkers in this department."—*Christian Union.*

The first part of the New Volume, being the December Part, contains

An Original Etching by G. P. Jacomb Hood, entitled

"THE FISHER-FOLKS' HARVEST."

The February number contains an illustrated article by Thomas Moran, and much other valuable matter.

CASSELL, PETTER, GALPIN & CO.,

739 and 741 Broadway, New York.

NEW ENGLISH BOOKS

At 25 Cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

THE

Sunderland Library,

THE PROPERTY OF THE

DUKE OF MARLBOROUGH,

PART II.

MESSRS. PUTTICK & SIMPSON

Will SELL BY AUCTION, at their Rooms, 47 Leicester Square, London, England, Monday, April 17, and nine following days, the first portion of this very important historical library, which is specially rich in early printed books, many of them on vellum and in fine bindings. Catalogues *raisonnée* are now ready, and may be had, post-free, price $1 25, of Messrs. TICE & LYNCH, 34½ Pine Street, New York, or from the Auctioneers direct.

BACK VOLUMES OF

The Nation.

For Sale, Vols. VIII., IX., X., XIII., XVII., XIX., XX., XXI., XXIII., XXIV., XXV., XXVI., XXVIII., XXIX., XXX., XXXI., unbound, at $1 each, postpaid.

Also, Vols. VIII., XIII., bound singly, at $1 25 each, postpaid; Vols. XVIII. and XIX., XX. and XXI., bound two together, at $2 25 per book, post-paid.

Address the Publisher, 210 Broadway, New York.

HELIOTYPE.

PERMANENT PHOTOGRAPHIC BOOK ILLUSTRATIONS.

THE HELIOTYPE PRINTING COMPANY

Are producers of illustrations by the most approved Photo-Mechanical, Photo-Lithographic, and Photo Engraving Processes. Employed by the United States Government in illustrating Scientific and Medical reports; by Scientific, Historical, and other learned Societies; by the leading Publishers, and for illustrating Town and Family Histories, Trade Catalogues, Show-Cards, etc. Fac-similes of Medals and Coins, Ancient Manuscripts, Paintings, Drawings, Sketches, and Autograph Circulars, Views and Portraits from Nature, Medical and Scientific Objects, Antiquities, etc.

Estimates and specimens furnished on application.

The Nation.

NEW YORK, THURSDAY, MARCH 9, 1882.

The Week.

MR. CONKLING has now definitively declined, in a letter to the President, the appointment to a seat on the Supreme Bench. This is undoubtedly the most satisfactory conclusion of the unfortunate affair. From the reception the nomination of Mr. Conkling for a high judicial office met with, President Arthur has had an opportunity to perceive that it would have been much better for him to follow the example set by himself in the appointment of Judge Gray, than to make a selection which everybody recognized at once as a political one. Some of the good opinion won by the appointment of Judge Gray and lost again by that of Mr. Conkling the President may retrieve, by now sending to the Senate the name of a jurist whom everybody will recognize as a fit man for our highest judicial tribunal, and whose nomination nobody will suspect of having been made for any other object than to serve the public interest. The nomination of Mr. Conkling has also served to show that what may be called the Garfield feeling, which, whether justly or unjustly, appears to be mainly directed against Mr. Conkling, is by no means dead yet. Neither is it confined to the Western Reserve in Ohio. It cropped out in more or less angry demonstrations all over the country when the news of Mr. Conkling's nomination went forth, and there is good reason to believe that it is just as strong in the rural districts of New York as in General Garfield's native State. The quiet citizen does not shake off strong impressions as easily as the active politician. This would very conclusively appear if, as has been suggested by some, the people were given an opportunity to vote directly for or against Mr. Conkling at a general election. The existence and strength of such a feeling may be deprecated, but it must be recognized as a fact. The talk of Mr. Conkling declining a seat on the Supreme Bench for the purpose of returning to active public life is therefore mere talk and nothing else. The first serious attempt would quickly convince him that his political future lies, for a considerable time at least, in the vast solitude of his grand and desolate self-appreciation.

The floods in the Ohio and Lower Missouri Valleys have passed out of those rivers, doing comparatively small damage, but have concentrated their devastating effects on the greatest cotton-raising region of the Southwest, which extends from Memphis southward to Natchez. Some thirty counties in the States of Arkansas, Mississippi, and Louisiana, bordering the Mississippi, White, and Red Rivers, are more or less submerged. The official reports from the State Commissioners of these States to the Secretary of War show that in these thirty counties there are now about fifty thousand people who have been driven from their homes, and are so destitute that they will have to be fed at the Government's expense for probably forty days. The effects of this disaster upon the next cotton crop can scarcely yet be estimated. The cotton crop of the thirty counties in question is on the average from year to year greater than that of any other thirty counties in the South, and is all of the low grade which makes up the great bulk of the American cotton supply. The cotton crop of all that part of the South is usually finished—or "laid by," as it is called—preparatory to picking, early in July. Consequently, there are only four months in which to repair damages, plant and cultivate to maturity a crop of cotton. The great destruction of fences, houses, cotton gins, agricultural implements, mules, etc., etc., will, in a large area of the flooded country render this impossible, and the yield of cotton from the thirty counties will unquestionably be so greatly diminished as to have an effect on the prices of the next crop.

The indictment against General Curtis for collecting assessments from Custom-house and Post-office employees has been handed into court, and he will accordingly soon be tried. The sums he thus obtained ranged from five to eighty dollars, and presumably came in every case from poor men, and were paid under duress. Not one of these would probably have felt, were he in the employment of a private firm, that he could afford to pay anything toward campaign funds, or at all events so much. Not one of them ought to have had the slightest private interest in the result of the election. No man's bread should be directly dependent on any election, or dependent on it at all except in so far as it is likely to affect legislation. General Curtis's defence is said to be that he is not an officeholder or employee of the United States Government within the terms of the statute, but it will disgust Mr. Thurlow Weed and all the Stalwarts if he puts in any such plea as this. He ought to take higher ground, and maintain, as Mr. Weed does, that the levying of assessments on officeholders is a noble and holy work, and that if it be necessary to suffer for it, he will be proud to do so.

The decision of the Supreme Court in the sugar case is of great importance to those sugar importers from whom the Custom-house has extracted about $1,500,000 of duties, which are now pronounced illegal, and will have to be returned. To the sugar trade in general it is doubtless not of much importance, at least as regards the future, as Congress will probably now make the change in the test of quality which Secretary Sherman undertook to make for himself. But it is of very great importance to the whole community, as a check on the tendency to arbitrary practices which has prevailed in the administration of the customs ever since the war broke out, and which is the result in part of the protectionist prejudice against all importers, and in part of the war-begotten feeling that the collection of revenue for the Government was too important to allow of any nice or delicate consideration of private rights which seemed to stand in its way. The matter, stripped of details, is simple enough. Congress has since 1861 prescribed a mode of ascertaining the value of sugar, which makes the color of the sugar the standard; the lighter the color the higher the value as a basis for duties. In the intervening years, however, manufacturers have managed to make the strength of the sugar, to a certain extent, independent of its color, so that, in short, a dark sugar shall really be as good a sugar as a much lighter one used to be, though still paying the old duty. The Custom-house undertook to meet this by substituting a new test, examination by the polariscope, in order to ascertain the strength of the sugar, and then tax it on the strength instead of the color. The Supreme Court now says that the Custom-house has no right to prescribe a new test, even if the old one is defective, and even if duties are evaded under it. This is the business of the Legislature, not of the Executive, and the Treasury must not attempt to remedy defects in legislation. Consequently all the duties levied under the polariscope test have to be returned, and the color test must still be used till changed by Congress.

The exports of domestic products during the week were not sufficient to furnish enough foreign bills of exchange to meet the demand for remittances to cover merchandise imports and the imports of securities, and the result was that it was necessary to export $2,501,600 more specie, the larger part of which was gold. This brings the specie exports since January 1 up to $11,291,340. At the close of the week the indications were that gold exports for the present were stopped, although the rates current still warranted them. The New York banks, although contracting their credits and reducing their deposit liabilities, again lost so heavily in reserve that they were short by the sum of $2,618,050 of the 25 per cent. reserve which the national banks are by law required to keep. The Treasury, which for a long time has been taking in more money than it has paid out, began about the middle of the week the prepayment without rebate of the $20,000,000 of 3½ per cent bonds included in the 107th call, which matures on the 13th instant. Thus far less than $4,000,000 of these bonds have been presented for prepayment; but the money on this account and for interest on the public debt, of which interest $2,800,000 was due on the 1st, have been sufficient to make the loan market easier for borrowers. During February the public debt was reduced $9,783,511, making the total decrease since June 30 last $97,869,442. At the Stock Exchange there was a strong market for securities early in the week, but later this was lost, and the suspension of the prominent banking and brokerage firm of C. A. Sweet & Co., of Boston, on Monday, added to the prevailing weakness. This firm was clogged with securities of new railroads, and was borrowing between $2,000,000 and $3,000,000 cash on them from the Boston banks; the demand

of the latter for more "collaterals" was the cause of the failure. It is thought that the firm will pay in full, the senior partner being reported to have $1,000,000 outside the business. In the foreign financial markets money is steadily becoming more plentiful, and rates for loans are declining, as is natural after such a collapse of speculation as was brought about by the failure of the Union Générale.

Mr. Miller, of California, made a great mistake in giving his Anti-Chinese Bill a preamble, because it makes the bill a little ridiculous. The bill forbids the immigration of Chinese laborers into the United States, because, says the preamble, "the coming of Chinese laborers to this country endangers the good order of certain localities." In other words, the country which owes a large part of its material greatness to the welcome it has accorded to foreigners, now proposes to pass one of the most exclusive laws ever put on the statute book of any country, directed against one of the most peaceable and industrious peoples on the globe, on the ground that their presence is in certain places likely to cause disturbances requiring the interference of the police. Doubtless Mr. Miller means a good deal more than this—that is, really believes that the Chinese work far more mischief in the United States than is involved in local disorder; but if so, he ought to have put all his fears in his preamble. The United States can hardly afford to put on record that, in order to keep the peace in certain localities, they had to pass a law of non-intercourse with a large and friendly empire. The bill which the preamble suggests would be a bill for the better protection of foreigners against native mobs, either by an increase of police, or an increase of the penalties now prescribed for assault and battery and riot. The presence of free negroes at the South after the war "endangered the good order" of a great many "localities," but no one proposed to meet the trouble by inviting the negroes to evacuate the country, or forbidding the entrance of all colored laborers from abroad. It was met by more stringent legislation for the protection of the blacks against white mobs, and by "waving the bloody shirt" at every election.

Moreover, how can we find fault with the Russian Government for permitting the maltreatment and expulsion of the Jews, if we ourselves proclaim that a popular race prejudice releases us from our obligations toward an obnoxious class in the matter of internal police? The truth is, that the bill is passed to carry out the treaty lately concluded with China for the restriction of Chinese immigration, and that treaty was called for by the hostility of the white population of the Pacific Coast, to the Chinese immigrants, on account of the cheapness of their labor, their alleged immorality, and the impossibility of their assimilating with or being absorbed by the Caucasians and Africans who are already in possession of the country. It is desirable both for our own credit and the truth of history that, in making such a marked change in our policy toward foreign immigration as this legislation involves, the true reasons for it, if any whatever, should be given. There should be no evasion of the real issue, because the legislation in question recognizes in the broadest way the political and social importance of race differences, which all through the controversy over the negroes the Republican party at the North has steadily denied, and insisted that the South should ignore in reconstructing itself after the war.

In the debate on the Anti-Chinese Bill Mr. Farley denied that the Chinese had ever shown any aptness in the arts and sciences or any inventive faculty, and was apparently cornered by Mr. Hoar, who asked who invented the printing press, the mariner's compass, and gunpowder. It seemed at first blush as if escape was here impossible; but Mr. Farley is a man of resource and not to be caught in that way, and he promptly replied that by Chinese he meant the Chinese laborers—in other words, the class whose coming to this country is prohibited by the pending bill. Of course this floored Mr. Hoar, who could not maintain that Chinese laborers had attained to any proficiency in the arts and sciences, and that it was a horny-handed Chinaman who had invented gunpowder and printing and the compass. Mr. Jones, however, got the better of Mr. Hoar more completely, for he denied that the world was indebted for these things to Chinamen of any class; for, he said, the Chinese had stolen them from Caucasian travellers who happened to be in their country, but he shrewdly declined to give the names of the travellers, or to mention the date at which the Chinese had played this trick on them.

Mr. Montgomery Blair has written to Mr. Miller in support of the Anti-Chinese Bill, in the character of a "thoughtful lover of his country," and gives as a reason for not "countenancing this Mongolian invasion" the assertion that it "involves primarily the subversion of our civilization," and says that Mr. Hoar seems "intent on submerging us with Asiatics." A "thoughtful lover of his country" is always a respectable character, though he is sometimes both a blockhead and a bore. But then a well-informed lover of his country is something much more useful. We regret to say that we cannot place Mr. Blair in this last-named category. He has written about "the Mongolian invasion" without knowing what he was talking about. There are, according to the best authorities, not more than 100,000 Chinamen in the United States, and their number has sensibly decreased since 1870, and is likely to decrease. It is not in the power of 100,000 men of any race to "subvert the civilization" of 50,000,000. There has never been anything in recent politics so absurd as the terror, real or affected, about the numbers of the Chinese, except the pretence of the San Francisco hoodlums that they compete with them in the labor market. There is hardly a lazy vagabond or tramp in the United States who does not try to believe that the Chinaman is keeping him out of work.

The Coinage Committee of the House of Representatives have reported a curious bill, accompanied by a still more curious report, on the subject of silver dollars and gold dollars, silver bullion and gold bullion, silver certificates and gold certificates. The bill first makes the standard silver dollar the "unit of value." There is an existing statute, by the way, which makes the gold dollar the unit of value, and this statute is not repealed by the proposed bill. The bill then provides that holders of silver bullion may deposit it at the Sub-Treasury in any amount, and receive "the market value thereof" in silver certificates, in denominations not less than five dollars, these certificates to be receivable for customs duties and taxes of all kinds. Under the operation of this bill, if it should pass, the first question would be: "What is the market value of silver bullion when the silver dollar is itself the unit of value?" Can it be anything else than that 412½ grains are equal to a dollar? Evidently the Committee thought it would be something different. Otherwise they would have said nothing about market value, but would have provided that holders of silver bullion might deposit the same at the Sub-Treasury and receive certificates therefor at the rate of one dollar for each 412½ grains. In order to give any point or efficiency to their proviso regarding the market value of silver, the unit of value must be something different from silver. In making silver itself the unit of value, and then providing for its acceptance at the Treasury at its market value, the Committee have perpetrated an Irish bull of the most muscular sort, and we need not remind them that such an animal is never more out of place than in the public mint. Their ignorance is equally well advertised in the report accompanying the bill.

The exposure of frauds in the government of Philadelphia may be expected to move more rapidly now that the reformers have got possession of the local legislature. It appears from the report of an investigating committee that a citizen, whose tax-bills during the last eight years have amounted to more than $100,000, upon making sale of a piece of property discovered liens for unpaid taxes upon it of more than $750. The citizen produced receipted tax-bills, but the ward collector had returned the property as delinquent. This theft by a minor swindler suggests the possible magnitude of the operations of the greater rings. The Gas Trust has been more than suspected, and the late election was a desperate effort, happily unsuccessful, to guarantee the further concealment of its doings. Philadelphia is sometimes regarded as a jealous rival of New York. In municipal mismanagement she certainly has held her own. In the continuance of outright stealing—as in this matter of tax thefts—she has fairly outstripped us. The fact that Philadelphia is a Republican city while New York is Democratic shows that administrative corruption is not a party matter. In one respect we have had the advantage of our neighbor—or ought to have had. A party in power at the State capital might be expected to exert a restraint upon the opposite party in power in the city, and to expose its shortcomings. As a matter of fact, however, the Republicans at Albany have not held this wholesome relation to the Democrats in New York; and even at this late day the former are found in a real or suspected alliance

with the Tammany ring, which makes any movement for municipal reform almost hopeless, if, as in the case of the firemen and police salary job, it does not actually make things worse than they are.

The list of governments, corporations, firms, and individuals engaged in settling the trouble between Chili and Peru is a long one, but it has been increased during the past week by the addition of Peter Hevener, who "claims" to be the principal owner of both the Cochet and Landreau claims against Peru. This new mediator has intervened in the quarrel by beginning proceedings for embezzlement against Mr. James B. Mantrop in the courts of Pennsylvania. Mr. Hevener, who is described as "a fine-looking man about sixty years old," tells on the whole a very straight though rather pathetic story of his Peruvian adventures. He did not himself invent the guano claims, but "for more than a quarter of a century he was the most prominent and active contractor in South America," which is saying a great deal, but not a word too much when we learn that under his supervision millions of dollars were expended in building reservoirs, driving tunnels, erecting public buildings, and constructing railroads, to say nothing of "laying water-mains across miles of arid plains to the tops of waterless mountains," perhaps for purposes of irrigation; while at one time, in addition to all this, he owned "five wholesale stores" in Lima. In 1840 Cochet discovered guano, and thereby became entitled to the reward of one-third of the value of the discovery offered by the Peruvian Government; but, like so many other discoverers, he never realized anything from it, and died in an almshouse in Paris, leaving an only son, who fell heir, of course, to his poor father's claims against Peru, amounting when he came of age in round numbers to $500,000,000. To this son there now appeared a benevolent friend in the person of Hevener, who advanced him sums of money from time to time to push his claims, when, after $50,000 had been spent in this way, Landreau suddenly turned up, stoutly insisting that it was he and not Cochet who discovered guano—though whether the same guano or some other guano does not clearly appear. At any rate, Hevener, who evidently knows all that there is to be known about the philosophy of claims, came to the conclusion that it was better to lend Landreau money than to "antagonize" him; and in this way he became in a short time the owner of nearly all the Landreau claim. What has become of young Cochet is not stated, but apparently he has no longer any interest in the Cochet claim, which has passed, like that of Landreau, into the hands of the benevolent Hevener. He says that the whole is "ready for collection," and adds: "If Peru is smart, she will pay the $900,000,000" (this probably includes the interest account) "at once, and not allow the debt to accumulate."

It seems doubtful whether the man who fired at Queen Victoria on Thursday really intended to kill her. He says himself that he was led to the act by hunger; in other words, he knew that if he could get himself arrested he would be sent to jail and so get some food. No bullet marks were found on the Queen's carriage. The man, whose name is Roderick MacLean, is described as a miserable looking object, and suspicions of his sanity were at first entertained. He has, however, been pronounced sane by the physicians who have examined him. He is twenty-four years old, and calls himself a "grocer's assistant." His punishment will probably be severe flogging and imprisonment. The affair, of course, has not the slightest significance, and the Queen does not seem to have even been frightened by the attempt. Messages of sympathy have been telegraphed from the Russian, Austrian, and German courts, and the feeling which led to them will be shared by everybody in this country. The event vividly recalls the warm-hearted expressions of sympathy by the Queen herself over the murder of the late President, and would half incline us to exaggerate the danger to which she has been exposed in order that we might the better express our gratification at her escape.

The reëlection of Bradlaugh by his old constituency is an embarrassing thing both for the Ministry and for the Opposition. Mr. Gladstone cannot any longer treat the matter as an indifferent one, on which his supporters can follow their own bent. Bradlaugh at first refused the oath on the ground that it would not be binding on his conscience, but offered and was allowed to affirm. The courts decided he had no right to affirm, and, his seat being declared vacant, he was reëlected. On coming up the second time he offered to take the oath, and said it would be binding on his conscience. But the Tories, and many Liberals, now said: "No; we will not let you take it now, for it would be profanation. What you said about it the first time was true; what you say now is false; besides, you are a wicked man, and we will not let you sit, if we can help it, in this religious assembly, where everybody believes in God and leads a pure life." And Mr. Gladstone said in substance: "This is very silly; you have no right to judge whether this man is sincere in taking the oath or not, and if I were you, I would let him in; but you may do as you please about it." And the result was that Bradlaugh was expelled, and has been a third time elected, and the Ministry must now take control of the matter, either by insisting that Bradlaugh be allowed to take the oath or by bringing in a bill providing a form of affirmation for all—and not Quakers only—who refuse to take an oath, and making its passage a test of their strength. On the other hand, the Tories are placed in the very awkward dilemma of having either to maintain persistently that it is for the majority of the House and not for the member himself to determine whether the oath is binding on a member's conscience, or to acknowledge, by now admitting Bradlaugh, that their previous opposition to him was frivolous.

Lord Redesdale is apparently about to try to settle the Bradlaugh question by bringing in a bill excluding atheists from Parliament. There is not much chance that anything of the kind would pass, even if proposed by a person whose judgment was in better repute than Lord Redesdale's. There are probably no atheists in the House of Commons, meaning by that persons who deny the existence of a God as an article of faith; but there is undoubtedly a very large number of Agnostics, or persons who declare themselves unable to say whether there is a God or not, and a still larger number who are utterly opposed to making professions of religious belief a qualification for office of any kind. In fact, Bradlaugh draws a great deal of whatever strength there is in his position from the widely diffused belief of the public that the House of Commons will not bear examination as a religious body. The House of Lords would doubtless fare better, as far as profession goes—most, if not all, peers feeling it to be due to their position to cultivate a believing frame of mind, and being deeply sensible of the dependence of the throne on the altar. It has always been difficult to get them to agree to the abolition of any religious qualification for office—even that sacramental test which long made it necessary for a man to take the communion from an Anglican minister before he could fill certain places.

Mr. Lowell has got into a "dungeon" trouble with an American Fenian named MacSweeny, who returned to his native country to engage in political agitation, and was arrested under the Coercion Act, and was, when he brought his case to Mr. Lowell's notice, confined in what he called "Victoria's dungeon," at Dundalk. Whenever an American Fenian is arrested by the British Government he is, curiously enough, always put into a "dungeon," the ordinary jail being apparently reserved for British subjects; and when he begins to call for deliverance at the hands of this Government, by the invasion of England, or the bombardment of London, as may be deemed most expedient, it is from a dungeon that his cries always issue. Mr. Lowell's reply to MacSweeny was in substance that when he began agitating in Ireland he was aware that the Coercion Act was in force; that in being locked up, he was, barring the dungeon, treated like the Queen's own subjects, and that he must have known before he began his work the perils to which he was exposed. This MacSweeny treated as the mockery of "an American citizen in chains," and drew from Mr. Lowell's talk the bold inference that he (Mr. Lowell) "held that if an American should in Ireland take part in a public meeting—say a prayer meeting—or engage in a public discussion with an Englishman, or a Frenchman, or a Zulu, he would forfeit the right to an appeal even to the courtesy of the Government." This startling proposition Mr. Lowell did not attempt to deny, but said he had tried vainly to get Lord Granville to let MacSweeny out of the dungeon, or to say why Victoria had put him into it. The result was that MacSweeny passed sixteen months in chains, and naturally feels sore about it, and wishes that some arrangement could be made under which Irish-Americans could go back to Ireland and set the British Government at defiance without exposure to dungeons and fetters.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC

On Thursday afternoon the Senate, by a vote of 39 to 12, confirmed Mr. Conkling's nomination to the Associate Justiceship of the Supreme Court. On Monday the President received a letter from Mr. Conkling declining the office.

It was reported on good authority in Washton on Tuesday that the President had offered the position of Associate Justice of the Supreme Court to Mr. Edmunds, and that he had declined it on the ground that his health would not permit him to undertake the arduous duties of the position.

Mr. Miller's Anti-Chinese Immigration Bill has occupied the attention of the Senate during the week. On Wednesday Senator Hoar delivered a long speech in opposition to the bill. On Thursday Senators Grover, of Oregon, and Farley, of California, spoke in favor of it. The debate was continued on Friday, Monday, and Tuesday. The Senators from the Pacific slope are all in favor of the bill, and some of the Eastern Senators, including Mr. Bayard, take the ground that Congress ought not to disregard the substantially unanimous wish of the people of California, as expressed at the polls, for absolute prohibition of Chinese immigration. Mr. Edmunds, too, has spoken on the same side.

Captain Eads's proposition to carry vessels across the Isthmus of Panama on a railroad, as embodied in a bill to incorporate the Inter-Oceanic Ship Railway Company, has been favorably reported to the Senate from the Committee on Commerce. It is stated that opposition to the bill in the committee was withheld as a compliment to the introducer, with the understanding that Senators who were opposed to it should have an opportunity to manifest their opposition by speech and vote.

On Monday the Senate passed the joint resolution for the return and remission of duties on the revised New Testament.

The House passed the Indian Appropriation Bill on Wednesday. The total amount appropriated is $4,920,203, an increase of $351,600 over the bill of last year.

The bill introduced by Mr. S. S. Cox, and which passed the House, to promote the efficiency of the Life-Saving Service, was passed by the Senate on Thursday, with amendments which provide for pensioning employees of the service.

A resolution reported from the Committee on Rules, providing for a joint committee to attend the celebration at New Orleans next month of the two hundredth anniversary of the discovery of the mouth of the Mississippi River by La Salle, was laid on the table by a strong majority on Tuesday.

The Tariff Commission Bill, reported by the House Committee on Ways and Means, will probably not come up for discussion until very late in the session, as it has been ruled that it is not a bill for raising revenue and cannot, therefore, take precedence of appropriation bills, but must wait its turn on the general calendar of the Committee of the Whole.

The House Committee on Foreign Affairs began on Monday the investigation, under the Kasson resolution, of the alleged abstraction of certain papers from the files of the State Department. The committee conducted the investigation with closed doors, but the Democratic members of the committee desire to have a public investigation, and it is thought possible that a resolution to this effect may be adopted.

On Tuesday the President received Baron Ignatz von Schaeffer, the new Austrian Minister, and Mr. Romero, Special Envoy of the Mexican Government, who is in Washington with a view to entering into negotiations for a treaty of reciprocity between Mexico and the United States. It is understood that Mr. Romero, within the limits of certain instructions, has been accorded full discretionary power to act for his Government.

The President has approved the Immediate Deficiency Bill, the Act to establish post routes, the Act to establish a port of delivery at Denver, Colorado, and the Act authorizing the Secretary of the Interior to furnish impressions of the cards of invitation to the Garfield memorial services.

The Treasury Department was informed on Tuesday of an attempt to smuggle about a ton of opium, on board the steamship *City of Tokio*, through the San Francisco Custom-house, and that when the offenders were arrested they offered to give the whole quantity of opium and $10,000 in addition to be released.

Postmaster-General Howe has transmitted a letter to the House in reply to the resolution calling for a list of all resignations, removals, and appointments made in the Post-office Department since March 4, 1881. Mr. Howe says that promotions, so far as he has been able to learn, have been uniformly made with regard to the merit and capacity of the employees. All candidates for promotion or appointment above the grade of a thousand dollars have been examined by a board to ascertain their qualifications, and in several instances these examinations have been competitive.

The contract division of the Post-office has sent out nearly 3,000 notifications to successful Star-route contractors, informing them of the acceptance of their proposals for service. The aggregate sum of the bids is about $4,000,000. A. E. Boone, one of the contractors now under indictment for conspiracy, has secured a large number of the awards.

The Washington Grand Jury brought in a second batch of indictments in the straw-bond and Star-route cases on Wednesday, and on Saturday the indictments for conspiracy in connection with the Star-route mail service against Brady, the Dorseys, and others, were formally presented in the Criminal Court. Colonel Bliss will endeavor to have the trial set for as early a day as possible, and hopes to begin it next month. It is thought that the defendants will move to quash the indictment and ask that an investigation be made to discover whether the evidence was properly presented to the Grand Jury. The prosecution, however, state that the hearing was properly conducted in every way, and that they have left no loophole of escape. The evidence in the other cases will be laid before the new Grand Jury which comes in this week.

The Board of Army Engineers appointed to consider the matter have made a preliminary report recommending the reclamation of the Potomac flats. It is estimated that the cost of the whole work will be $2,500,000.

The Mississippi River continues to rise, and more levees are giving way every day. The Secretary of War and the State Governments of Mississippi, Arkansas, and Kentucky are sending supplies and doing all they can to aid the sufferers by the flood.

A large meeting of Kentucky Republicans was held in Louisville on Thursday, at which resolutions condemning the coalition with the Anti-Bourbon Democrats were adopted.

The Executive Committee of the Republican State Central Committee of Tennessee have unanimously recommended Republicans to vote for a Constitutional Convention to settle the question of the State debt. The Republicans of the State are said to be generally in favor of settling the debt on the best terms that the creditors may voluntarily offer.

The sub-committee of the Finance Committee of the City Councils of Philadelphia, which has been engaged in investigating the Tax Office defalcation, has made a report to the full committee, from which it appears that a system of peculation has been carried on for years by nearly all of the clerks employed in the Tax Office, resulting from the "negligent, if not criminal manner, in which the department was conducted."

It is thought probable that Governor Cameron, of Virginia, will call an extra session of the Legislature for the purpose of acting upon Senator Mahone's scheme for redistricting the State so as to give the Readjusters at least eight out of the ten members of the House of Representatives to which Virginia is entitled.

The Republicans of South Carolina held a conference at Columbia on Thursday to consider questions affecting the rights and interests of the Republicans of the State. It was decided to ask the Federal Government to make suitable provision to obtain legal registration, under the Federal election law, of all the voters in the State. The State Executive Committee will probably draw up a memorial to Congress on the subject.

The court-martial which has been trying Sergeant Mason for his attempt on the life of Guiteau completed its labors on Thursday. The proceedings of the board will be submitted to Major Gardner, Judge-Advocate of the Army, who will review the evidence and findings, and will submit the record of the case, with such comment as he sees fit, to General Hancock. It then rests with General Hancock to approve or set aside the verdict rendered by the court-martial.

The death rate in New York city has increased five hundred a month for the past two months, which is far too large to be accounted for by any increase in the population, nor can any satisfactory reason for the increase be given, since January and February are usually healthy months.

Steps are being taken in this city to provide properly for the Jewish refugees who are expected soon to reach this country from Russia. Already nearly 3,000 of these exiles have come to New York from southern Russia, and nearly 1,000 are now on their way, and before the summer the number of arrivals is expected to be increased to 10,000.

The six days go-as-you-please walking match in New York was finished on Saturday. Hazael won the race by covering 600 miles. He will probably get about $19,000 as his share of the prizes and gate money.

The Inman line steamer *City of Berlin*, which was nine days overdue, was towed into port at Boston on Sunday by the Cunard steamer *Samaria*. The screw shaft of the *City of Berlin* became disabled on the 22d of February, and from that day until the 27th, when she was sighted by the French steamship *Ville d'Alger*, she drifted about under sail. The *Ville d'Alger* gave her some assistance until the following day, when the *Samaria* was sighted, which took her in tow for Boston.

FOREIGN.

Queen Victoria was fired at as she was entering her carriage at the Windsor railway station, on Thursday evening, but escaped unhurt. The would-be assassin, who is represented as a miserable-looking object, was at once arrested. An attempt was made by the crowd to lynch him, but the police succeeded in carrying him off. His name is Roderick MacLean, and he is said to be a grocer's assistant. His family solicitor writes that he possesses certificates of eminent physicians of the existence of mental aberration in the prisoner, of long standing, and that there will be no difficulty in establishing the fact of his insanity. He adds that MacLean is the same person who attempted to wreck a railway train in 1874, and that the report that two doctors at Windsor had declared him sane is untrue. Meanwhile congratulatory despatches have been pouring in to the Queen from all parts of the world. In the House of Commons on Monday, Mr. Gladstone, in moving the address to the Queen, said that similar attempts upon the lives of rulers in other countries had been associated with some grievance or discontent, whereas the attempt upon the Queen

was prompted solely by a morbid desire for notoriety in an intellect of the narrowest kind.

Mr. Forster, Chief Secretary for Ireland, was invited by the House of Lords Committee to give evidence at the inquiry of the committee into the working of the Land Act. The invitation included an important statement in regard to the scope of their inquiry, which was designed as a basis of agreement on the issue raised between the House of Lords and the House of Commons. The Cabinet held a special meeting to consider the matter, and decided that neither the form nor the substance of the communication justified their acceptance of it as a settlement of the question raised by the House of Lords, and Mr. Forster was directed to decline to give testimony before the committee.

The statement included in the House of Lords committee's invitation to Mr. Forster was that the committee do not consider it within the scope of their inquiry to discuss the correctness of any of the commissioners' decisions. This is looked upon in some quarters as a practical surrender of the original position taken by the House of Lords.

The debate on Mr. Gladstone's resolution was continued on Thursday. Mr. Sexton made an attack on the administration of the Land Act. He stated that out of 70,000 applications to the Land Court, only 1,313 cases had been decided within the past three months, the result being that it would take years to adjudicate the entire number, and that meanwhile the tenants whose cases remained undecided would be forced to pay back rents.

The election at Northampton on Thursday to fill the vacancy in the House of Commons caused by Mr. Bradlaugh's expulsion, again resulted in his return. The vote was 3,798 for Mr. Bradlaugh, against 3,687 for Mr. Corbett. At a meeting of the Opposition members of the House of Commons on the same evening it was decided to resist any attempt on the part of Mr. Bradlaugh to take his seat.

On Monday in the House of Commons Sir Stafford Northcote moved that the House reaffirm its resolution of February 7 that Mr. Bradlaugh be not allowed to go through the form of repeating the words of the oath. Mr. Majoribanks then moved an amendment in favor of legislation permitting affirmation. Mr. Gladstone supported the amendment as the best means of relieving the House from its increasingly painful position, but notwithstanding this it was defeated by a vote of 257 to 242. Sir Stafford Northcote's motion was then carried without a division. Mr. Majoribanks then gave notice that he would ask leave to bring in a bill amending the law in regard to the oath.

There was a "scene" in the House of Commons on Friday in consequence of the admission of Mr. Johnson, Attorney-General for Ireland, that a warrant under the Coercion Act existed against Mr. O'Connor, Home Rule member of the House for Queens county. Mr. O'Connor moved an adjournment, and inquired with what offence he was charged. Finally an endeavor was made to exact a pledge from the Government that it would not cause the arrest of members visiting their constituents, but Mr. Gladstone refused to grant such immunity or to give any further information.

Mr. Forster, Chief Secretary of Ireland, has been making a tour of inspection through the disaffected districts, and it is expected that it will be productive of substantial benefit. The fearlessness with which he moves about is everywhere commended. In a speech at Tullamore, County Kings, on Monday, Mr. Forster said that he had come to the disturbed districts to see for himself whether the reports of outrages were correct. He announced that as soon as the outrages ceased the suspects would be released.

A Parliamentary return shows that up to February 24th, 72,408 applications had been made to the Land Court to fix fair rents; that the parties agreed between themselves in 2,180 cases, and that 2,365 cases were decided by the Court.

A judgment was recently given by the Court of Appeals at Dublin, in the matter of the appeal from the decision of the commissioners under the Land Act, on the reduction of a tenant's improved fixed-lease rent, the principal effect of which will be to limit the improvement for which a tenant cannot be charged increased rent to works actually executed by him.

A deputation "representing thousands of unemployed persons" waited on the Lord Mayor of London on March 1st, to ask his advice and aid in regard to emigration. He advised them to confer with Sir Alexander Galt, High Commissioner for Canada, and promised his assistance if any scheme of emigration was devised.

The Russo-Jewish Committee in London has prepared a statement, founded upon letters from persons occupying high official positions in the Jewish community and upon personal evidence of Jewish refugees. It confirms the reports of the outrages upon the Jews which were discredited by the recent British consular reports.

The Queen's monument to Lord Beaconsfield has been erected in Hughenden Church. It bears the inscription, "This memorial is placed here by a grateful and affectionate sovereign and friend. Victoria R. I. 'Kings love him that speaketh right.'"

The returns issued by the Board of Trade show that during the month of February British imports had decreased, compared with the same month last year, by £600,000, and the exports had increased by £2,100,000,

The latest in regard to General Skobeleff's famous speech is that it was submitted to General Ignatieff before it was delivered, and that he struck out several pages. Skobeleff, however, "allowed himself to be carried away by champagne, and took no account of the erasure when he delivered the speech." The Czar is reported to be very much "distressed and annoyed" by the effect of the speech, and has written to the Emperor William explaining the whole matter. Skobeleff has been "interviewed" a number of times on his journey to St. Petersburg in regard to it, and expresses great surprise that his remarks should have created such a sensation, and repeats that he spoke only as a private individual, and that the same sentiments are expressed every day in all parts of Russia without any notice being taken of it.

Advices from St. Petersburg state that General Ignatieff's policy is so distasteful to M. de Giers, of the Foreign Office, and M. Bunge, Minister of Finance, that they have tendered their resignations, and that the fact that Count Valuyeff has recently had private audiences with the Czar, has given rise to rumors that he is to become Minister of the Interior to succeed General Ignatieff.

Russia has demanded priority for her claim on the Rumelian treasury of 23,000,000 francs for the maintenance of the Russian army of occupation. The Porte contends that it is for the powers who signed the treaty to decide as to the amount due Russia, and also that the amount of revenue the Russians collected while occupying the province should be deducted from the claim.

A Berlin correspondent writes that emigration from Germany to America promises to be very much greater this year than last.

During the months of January and February 12,655 emigrants left Hamburg for the United States.

The opposition displayed in the Prussian Economical Council to the Tobacco Monopoly Bill has surprised and annoyed Prince Bismarck, who counted upon the Council's vote as a standpoint to be used in the Bundesrath against the opposition of the South German States.

A despatch from Belgrade announces that on Monday, at the unanimous invitation of the Skuptschina, Prince Milan accepted the title of King of Servia. The diplomatic body was thereupon acquainted of the fact, and the Austrian Minister soon afterward conveyed to Prince Milan the congratulations of the Emperor Francis Joseph.

It is understood that Russia, Austria, and Germany assented to the elevation of the principality of Servia to a kingdom, and that Italy and Germany have recognized the kingdom.

It is officially announced from Vienna that the Austrians have captured Ulog after a desperate resistance.

The Austrian military authorities in the insurgent provinces have received strict orders to prevent the despatch of any reports whatever, except such as are official, in regard to military movements, and it is stated that the correspondent of the Manchester *Guardian* in Dalmatia (Mr. Evans, son-in-law of Mr. Freeman, the historian) has been ordered to quit Austria within three days. Two persons have been arrested at Ragusa for assisting Mr. Evans to spread news of insurgent victories.

The Cyril and Methodius Slavic Society of Odessa, in order to testify its sympathy with the Herzegovinians and Krivoscians, has unanimously elected a prominent insurgent leader an honorary member, and has applied to the Government for permission to organize subscriptions in aid of the refugees in Montenegro. Generals Gourko and Skobeleff were also elected honorary members.

A despatch from Tunis says that the insurgents have reappeared in the vicinity of Sfax, where they have raided on the tribes which have submitted to the French. The news from the Regency is, however, on the whole, satisfactory. Two battalions of troops have returned to France. M. Roustan has requested the liberation of Taid Bey, who is imprisoned for conspiracy against the Bey.

On Monday the French Chamber of Deputies voted to consider a proposal for the abrogation of the Concordat. M. de Freycinet approved its consideration.

A despatch from Paris states that the French Cabinet has approved the plan of Admiral Jauréguiberry, Minister of Marine, for a scientific expedition to the south pole in coöperation with other powers.

A meeting of Socialists is to be held in Paris to protest against the sentences recently passed on the Nihilists at St. Petersburg.

Four hundred rifles have been discovered in connection with a plot in Catalonia, Spain. They are believed to be the property of Carlists.

A decree has been published convoking the Spanish Cortes for the 20th instant.

In the Spanish Cabinet on Monday the bill of the Minister of Justice introducing the provisions of the press law into the penal code, and repealing special legislation in regard to press offences, was discussed.

The Greek Chamber, after a three days' debate, has invalidated the seat of the Minister of War by a vote of 144 to 99.

The twin monuments erected over the graves of the poet Keats and his friend Joseph Severn were unveiled at the Protestant Cemetery at Rome on Sunday. Mr. T. A. Trollope presided at the ceremony, and Mr. Story, the American sculptor, delivered a speech. There were many English and American residents present.

A meeting is reported to have taken place in Lima, Peru, with a view to the organization of a new Government, of which Pierola is to be a prominent member. Dr. Antonio Arenas is spoken of for the Presidency. An executive committee, composed of prominent men, was appointed to start a popular movement in favor of a new and strong administration.

TUESDAY, March 7, 1882.

A "SPIRITED FOREIGN POLICY."

THE Consular and Diplomatic Appropriation Bill gave occasion in the House of Representatives for what is figuratively called "letting off steam." This bill has not unfrequently served to open the floodgates of gorgeous and harmless blood-and-thunder eloquence, and it might this time, as frequently before, be passed over without serious notice were we not informed by reports from Washington that the speech of Mr. Whitthorne of Tennessee was to sound the "keynote" of a new departure, a living issue to be made by the Democratic party. It appears that the Democratic party seriously thinks of giving the country a "spirited foreign policy," the principal modern features of which it has borrowed from Mr. Blaine. This is the subject upon which Mr. Whitthorne grew eloquent. The impression he evidently desired to convey was that Mr. Blaine's way of carrying on our foreign policy was "the thing," and that Mr. Frelinghuysen's was not, being governed by "the shadow of Wall Street's speculative capital," and that the Democratic party was therefore bound to have the former.

It will be useful to our Democratic friends, before they commit themselves, to inquire what kind of a "spirited foreign policy" will commend itself to the good sense of the American people. If it is one which will resent an insult when it is offered to us; which will protect the rights and safety of American citizens abroad whenever and wherever they are threatened; which will clearly ascertain what our interests are, and then enforce them with justice, intelligence, and dignity; which will maintain friendly relations with weaker states, and use our influence for their benefit when they call upon us to do so, and when it can be done without prejudice to their rights, then we are all agreed. Such a foreign policy we ought to have. But when a "spirited foreign policy" means that we should construe every difference of opinion as an insult for the purpose of having something to resent; that we should constantly carry a chip on our shoulder, daring anybody to knock it off; that we should use every possible occasion to "twist the tail of the British lion" for the fun of it; that we should have our finger in every quarrel merely to make our influence felt, and act the universal bully, shaking our fists in everybody's face to inform the world that we can "whip all creation," then the sober judgment of the American people will be that the less we have of such a "spirited foreign policy" the better for our good name as well as our true interests.

The fact is that the indiscriminate screaming of the eagle could really gratify the American people only in their boyish days, when a lingering doubt of their own strength impelled them to force the respect of foreign nations by frequent and vociferous self-assertion. We have got beyond that now. The American people have grown to man's estate. When a business man is rising in fortune, but is not yet recognized, he may think that blazing diamonds on his shirt-front will impress others with his wealth. When his success is sufficiently established and known, the same man will feel that it becomes him to be simple, and that ostentatious display will injure his reputation for good sense. The American republic has grown so great that it can afford to maintain the self-restraint and undemonstrative dignity of conscious strength without being misjudged by anybody as to its power. That power is universally recognized, and no intelligent European statesman would think for a moment of disputing its superiority on this continent. If we, after the tremendous change of circumstances which has taken place, still exhibit the same sensitiveness and alarm about the possibility of European encroachment on this side of the Atlantic which with greater reason we might have shown forty or fifty years ago, we shall only persuade European powers that we ourselves are not so sure of our superiority here as they have thought us to be.

Of the practical working of the "spirited foreign policy" in the boyish sense, we have already had some instructive illustrations. We, too, think that this republic should have predominant influence over an inter-oceanic canal when it is built, and that the Clayton-Bulwer Treaty should be and will in the course of time be modified. But when Mr. Whitthorne speaks of the "steps taken by Mr. Blaine to modify the Clayton-Bulwer Treaty," it may justly be said that Mr. Blaine has really taken steps to prevent its modification. For, while British statesmen may have come to the conclusion that the exercise of controlling influence by the United States of an inter-oceanic canal may in the course of time be inevitable, and while they may be willing to "be let down easy" in that respect, Mr. Blaine put the matter before them in language unnecessarily offensive to their self-respect, which makes an early accord more than usually difficult. We, too, are in favor of exercising a conciliatory influence in the quarrels of our sister republics, and even of mediating between them when called upon by them to do so. But we do not consider advisable the "spirited policy" of uncalled-for meddling which came near involving us in a most unnecessary war, and has resulted in the necessity of severely checking one of our foreign ministers who was negotiating for a railroad, and of investigating the proceedings of another whose business house made contracts the execution of which was conditioned upon the success of diplomatic action he himself was engaged in. We, too, think that a war may sometimes become necessary, but we are also convinced that a war is not a good thing for a republic, and ought, whenever possible, to be avoided. We, too, think the commercial interests of the United States deserve intelligent consideration. But we are sure that every attempt to restore the foreign commerce of this country by diplomatic tricks instead of sensible economic legislation will prove delusive and futile.

What the American people want is a just, sober, sensible, and dignified foreign policy. If the Democrats think they can carry public opinion, and thereby a Presidential election, by presenting a programme that is "spirited" enough to disturb our peaceful relations with the world, they only prove again that whenever there is a blunder to be made the Democratic party is sure to jump at the chance.

ENGLISH AND AMERICAN MINISTERS.

IN a recent interview, the Rev. Dr. Bevan, of the Brick Church of this city, gave the reasons for his approaching return to England, his native country, after five years' residence here. It will probably take most people by surprise that he should think of returning, in view of the readiness with which several English and Irish ministers have of late years accepted calls addressed to them by churches on this side of the water, and in view also of the fact that similar invitations from England to ministers here have not been successful. Most, if not all, of the English ministers who have been called by American congregations have been Dissenters, and have come to take charge of churches which in England would be Dissenting churches. The American notion has hitherto been that English Dissenting ministers were glad to escape from the position of social, if not political, inferiority in which the existence of the Established Church and the traditions of English society place them, and get to a country in which one minister or one denomination is as good as another. This same view has, we believe, prevented any American minister (not an Anglican) of note from accepting any offer, however flattering, of a settlement in England. No American minister cares to leave a society in which he is as good as the best, for one in which he would occupy a distinctly second-rate position socially, and in which the upper clergy of another denomination would think and talk of association and coöperation with him as signs of unusual liberality of mind. Some of the recent pastoral utterances on this subject of the broader English bishops have in fact been, in their very effusiveness toward Dissenters, what an American might consider a little insulting.

Dr. Bevan, however, seems to take no account of this whatever. His reasons for going back are two: one, that he likes the London climate better than this, believing it to be a climate in which a man can do more work with impunity; the other, that in London the minister of any denomination has a much wider sphere of usefulness open to him than in New York. The meteorological reason we shall not undertake to discuss. The second is very interesting. He said:

"Your professional men, especially clergymen, seem to be restricted to purely professional work in a fashion that we do not dream of in London. Here it seems to be understood that a clergyman cannot go outside of his strictly professional work without doing wrong. He is outside of politics entirely; he is not expected to lecture much, not expected to concern himself with social questions, and not expected to concern himself much with education, justice, or temperance. To a Londoner this seems all wrong, but it is useless to question it. Any attempt to break through these lines results in unpleasantness. Clergymen are well paid, and kindly treated, but they are not expected to work for the good of their fellow-men, except in certain defined lines. In England the clergy of the Establishment are frequently justices of the peace. We of the Non-Conformist party are members of the School Board, Public Works, and so forth, and take a part in all public movements. The London School Board has a number of clergymen; I was the member for Marylebone for some years. I took the greatest interest in my work, and all who have looked into the question know what a perfect school system we have in London. Every

child in the city has to attend school or explain its absence. I believe even the Prince of Wales's children were called upon. I feel the want of such employment here to some extent, although I have not been idle by any means as pastor of the Brick Church ; but it would not be liked, I am sure. You Americans are far more conservative than Englishmen, and we, who feel it in every-day life, do not always like it. I was asked to go to a great meeting on a public topic soon after I got here, and went to find that all I was expected to do was to open the meeting with a prayer and close it with a benediction. I was dumfounded."

There are probably few American ministers who would not take exception to every one of these generalizations We suspect that there is, neither in England nor in America, anything like positive expectation on the part of the public, or on the part of his own congregation, that a minister's activity shall display itself in fields outside his professional work. We question much whether in either country a congregation has ever been dissatisfied with a minister on this score. There are and have been in London several eminent Dissenting ministers who have displayed no such activity—Mr. Spurgeon is one—without causing any apparent disappointment to their admirers. Is it not true that in both countries the matter is left to the minister's own temperament, and ambition, and intellectual needs? If he busies himself with politics or philanthropy, the congregation says, Well and good. If he confines himself to purely professional work, it also says, Well and good. In this country, ministers who have the health, the capacity, and the overmastering impulse to go outside their churches and occupy themselves with education, charities, and temperance abound everywhere. Every city of any size can show some. In New York there are many. We suspect that the churches of both the late Dr. Bellows and of Henry Ward Beecher have been rather disposed to think that their pastors did too much during the last twenty years of the very kind of work which Dr. Bevan complains that he cannot get at all. But it is a kind of work which neither in this country nor in England is forced on any man, either lay or clerical. Every professional man gets as much of it as he asks for—no more, but no less. If a minister goes to many public meetings without being invited to do more than pray and pronounce the benediction, he may be sure that it is because he has given no recognizable sign of desiring a more prominent part. The American demand for oratorical thunder and organizing activity is practically unlimited.

As regards clerical participation in politics, Dr. Bevan's remarks have a good deal of force. There is little question that in the large cities, and especially in this city, the caucus is an all but insurmountable barrier to anything like active participation in politics on the part of educated men of any calling. In the first place, the platform talk of a man who neither goes to caucus nor controls the daily press has comparatively little weight with the class who make up political conventions. It goes in at one ear and out at the other, and they privately ridicule him as a theorist or doctrinaire. In the second place, an honorable and educated man cannot participate in a New York caucus without exposing himself either to humiliating defeats, or to apparent participation in acts and practices which are revolting to his moral sense. If he continues to attend it constantly without lowering his standard both of private and political integrity, he rapidly becomes an object of ridicule to the "workers," and, if he is worth much to the community, soon reaches the conclusion that his time can be far better employed in his study than at the primary. In England, where the caucus is not yet established, and the office-holders do no political work, volunteers of all classes are more necessary and more welcome in politics than here, and ministers may if they please be as active politically as they used to be in New England, and in some parts of it are still. In fact, it is of the utmost importance to every democratic community that its professed moralists should not be excluded from politics, but should, on the contrary, take an active part in them. Nothing but good can come of it if the machinery is such that it can be worked just as easily by the honest men as by the knaves.

THE VACCINATION QUESTION.

The recent epidemic of smallpox has had the usual effect of calling public attention to the merits of vaccination, and of producing a large amount of discussion upon the subject. The parties to this discussion represent every possible shade of opinion. Some declare that vaccination has not only not diminished, but has actually increased, the virulence and fatality of smallpox, while it has been the means of spreading syphilis, scrofula, and other similar diseases. Others assert that it is an almost specific preventive of smallpox—that a person properly vaccinated is safe in a smallpox hospital filled with the worst form of cases, and that the operation is so simple and certain that it should be made compulsory and universal. The non-professional man is sometimes much puzzled to decide between these conflicting statements, and as to the reliability and true significance of the voluminous statistics which are produced on either side ; and although in most cases he follows the majority, and has himself and his family vaccinated, or revaccinated, as the case may be, he nevertheless has some lurking doubts and fears as to the result, and as to whether the amount of protection obtained is worth the trouble and cost which it involves.

It seems worth while, therefore, to state briefly the opinions which prevail upon this subject among those physicians and statisticians who are generally recognized as scientific investigators, and as authorities in their respective departments. We must be guided by probabilities in this matter ; and as we find that such physicians and statisticians as we have referred to are almost unanimous in their views upon certain points, and are only opposed in them by men who are not specially known as scientific men, but rather as popular agitators, the probabilities are largely in favor of the opinions which we summarize as follows :

Smallpox is a specific disease, produced by a special contagium which never arises spontaneously, but is always derived from a case of the disease. No combination of filth, overcrowding, bad food, temperature, moisture, etc., will produce smallpox in the absence of the specific contagium. Persons who have had the disease once rarely have it a second time, yet in violent epidemics the number of cases of second attacks may be as high as 6 per 1,000 of all cases, and 10 per cent. of these second attacks prove fatal. Persons of all ages and conditions of life seem to be equally susceptible to the disease ; but prior to the introduction of vaccination about 80 per cent. of deaths from smallpox occurred in children under 5 years of age. Smallpox, during the last century, caused about one-thirteenth of the total number of deaths, taking the statistics for long periods of years, and its epidemics swept over Europe at intervals varying from 5 to 10 years ; that is, about as often as a fresh stock of susceptible material was produced by births.

Vaccination began at the commencement of the present century. At first it was supposed to be an absolute preventive against smallpox, and that if a person had the disease after vaccination, it was a proof that the operation had not been properly performed. It is now, however, well recognized that the protection produced by a perfect vaccination is not so thorough as that produced by an attack of smallpox, and that properly-vaccinated persons may not only be attacked by smallpox, but may die of it. Nor is the effect produced by vaccination a permanent one, its mean duration being usually estimated at from 9 to 10 years. Of 731 deaths in the Leipsic epidemic, there were 9 in persons under 10 years of age who had been vaccinated. Of 48 deaths in the Riverside Hospital, New York, 44 were unvaccinated, three were doubtful, and one had been vaccinated. In all countries where vaccination has been general, when an epidemic of smallpox occurs, the larger part of the cases are in vaccinated persons, the reason being that there are present a very much larger number of vaccinated than of unvaccinated persons. In such communities the greater number of deaths occur in persons over 25 years of age, instead of in children, as is the case in unvaccinated communities. Systematic revaccination renews the immunity for a term of years, and has a powerful influence in reducing the mortality among adults in communities where it is practised. This is conclusively shown by the statistics of the armies of the United States and of other countries.

Vaccination in some cases produces immediate bad results, but these are rare exceptions. It must be remembered that vaccination is usually performed in infancy, when disease and death are more frequent than at any other period of life, and we cannot expect that vaccinated infants will present any immunity from disease and death except so far as smallpox is concerned. It must not be concluded, therefore, that all cases of sickness and death following vaccination are caused by it ; this is the old fallacy of *post hoc ergo propter hoc*. But in a very few cases vaccination produces disease. During the year 1877 there were in Prussia 1,252,554 vaccinations, and 44 deaths followed in these cases. An official investigation showed that in 42 cases this was merely a coincidence ; in 2 cases the death was really due to the vaccination. The English reports show that in 2,000,000 vaccinations death resulted from the operation in 64 cases.

The greatest danger from vaccination is from the use of impure virus, and especially from virus taken from persons affected with syphilis. The total number of cases in which the transmission of syphilis by vaccination has been reported is about 750, and this in more than 100,000,000 cases of vaccination during the last 80 years. This danger is now totally avoided by the use of bovine virus. The possibility that bovine virus may be the means of transmitting tubercle has been suggested, but as yet there is no known authentic case of such transmission, and the danger must be very small. The chief evil to be feared from the use of bovine virus is erysipelas, and this may be due either to impure virus or to the condition of the person operated upon. There is

a very considerable quantity of impure virus in the market at the present time, more especially in the form of what are termed patent vaccine-cones and vaccine-powder; and in this country there is no satisfactory supervision of the quality of the virus used, except perhaps in the city of Providence.

The remote effect of vaccination is to increase the mortality from diseases other than smallpox: the children whom it preserves furnish additional material for the ravages of scarlet fever, measles, etc. It prolongs life, but, taking long periods of years into account, it does not diminish the total mortality. Those who do not die of smallpox must, sooner or later, die of something else. We have examined carefully the statistics presented by the anti-vaccinationists, and especially those given in the works of Prof. A. Vogt, of Berne, but we have found them entirely unreliable. In some of the few cases in which the references to the original data are given, the figures are incorrectly quoted; in others the calculations of ratios do not give the results claimed. For example, on page 168 of his larger work, 'Für und wider die Kuhpockenimpfung,' etc., he gives the following table:

MORTALITY FROM SMALLPOX AT GENEVA DURING 180 YEARS (1580 TO 1760).

Age.	Mean population.	Mean number of deaths per annum from smallpox.	Proportion of deaths in 10,000 inhabitants (as given by Vogt)	True proportion.
0-5 years	1,383	30.37	87.6	219.6
5-10 "	1,163	5.88	20.2	50.6
10-15 "	1,058	0.70	2.6	6.6

The fourth column shows Vogt's calculation of ratios, and the fifth shows the true ratios. It is impossible to have the slightest respect for an author who is either so ignorant or so mendacious as to assert that the ratios stated in the fourth column are correct; and yet Vogt is the statistician *par excellence* of the anti-vaccinationists.

It seems clear enough that vaccination has preserved and prolonged many lives, and prevented a vast amount of bindness, deafness, and other afflictions which smallpox is so apt to produce when it spares life; and also that the evils which result from it are so very small in comparison with the good it has produced that no one need hesitate to avail himself of the protection it affords. On the other hand, there is no immediate prospect that it will enable us to stamp out smallpox, nor is it by any means an absolute safeguard; and when it comes to the question of making vaccination compulsory, we have to take into consideration a number of other things besides the mere efficiency of the vaccination itself. We cannot undertake to discuss the merits of compulsory vaccination within the limits of this article, and would only suggest at present that it is far more necessary in this country to provide some means by which all persons can obtain thoroughly reliable, pure vaccine, and also for the prevention of the sale of impure virus, than it is to secure compulsory vaccination; and that it is inexpedient to demand the latter until the former has been satisfactorily provided for. It is the compulsion that has produced most of the controversy. No doubt if a law had been passed forbidding vaccination, a certain number of the people who now oppose it would have organized into a society, started a journal, and vaccinated themselves and their children once a year, or oftener if necessary, to prove their abhorrence of compulsion.

THE ORGANIZATION OF COLLEGE FACULTIES.

THE growth of some of the larger of our universities is beginning to give especial interest to a question which for some years past has been receiving the thoughtful attention of the university authorities in the Old World. The multiplication of branches taught on the one hand, and the tendency toward a concentration of individual energies to the prosecution of special studies on the other, give rise to some considerations of not a little importance. What ought to be the organization of a large academic faculty? Should it be divided into separate schools, each school having plenary jurisdiction over the students and the affairs of that school, or should it maintain its organization in its integrity? Ought all of the numerous questions coming up for decision to be referred to the whole body of instructors, or ought the faculty to be subdivided into groups, to each one of which alone the particular questions appropriate to that group should be referred? Is it wise to encourage the organization of separate schools analogous to the Sheffield and the Lawrence Scientific Schools, or, on the other hand, is it better to keep all the officers of instruction within the general jurisdiction of a single organization? The importance of the subject increases as the number of officers in a faculty multiplies; and consequently, in some of the universities of Germany, where the philosophical faculty numbers a hundred or more members, it has become one of the vital educational questions of the day. As we go to Italy for the study of art, and as we go to England for the study of constitutional government, so we go to Germany for the study of educational theories and methods. The subject having recently attracted so much attention in Germany, it may be well to present some of its most important features.

As early as 1832 the several questions involved were discussed by Robert von Mohl in the first edition of his 'Polizei-Wissenschaft.' The ground was taken that studies in science and studies in philosophy and philology are so radically different that, sooner or later, those in control of educational matters would come to see that the interests of education require the organization of separate faculties. The next impulse to the policy of division was given at Giessen in consequence of the prominence to which scientific studies were raised by Liebig. In 1855 the Ministry addressed a note of inquiry to the philosophical faculty of that university, asking the members to consider whether the cause of education would be enhanced by a division of that body into two or more schools. The question was carefully discussed, and was decided in the negative. But the University Senate took the opposite view, and, by a very small majority, decided in favor of a division into three schools. The Ministry, however, took no action on the subject. But in 1863 the same question was successfully revived in the very university in which the first word had been spoken in its behalf. The party advocating division carried the day; and from the inaugural address of Hugo von Mohl, a brother of the famous economist and the first dean of the new scientific faculty, we learn that the division was brought about in consequence of a movement in the faculty of medicine.

The policy of division, however, though entered upon with enthusiasm by the University of Tübingen, was not adopted by the other universities. The Austrian Government inquired of the philosophical faculty of Vienna whether a division would be advantageous. The proposition was rejected by a large majority. The university at Breslau also considered the question with the utmost care: for two full years it was under discussion. The policy of division at one time was adopted, but when the details came to be decided upon there was so much difference of opinion that the majority was reduced to a minority, and the proposition was at last rejected. Other universities considered the question with the same result. Although in several of them a strong party in favor of separate organizations was developed, yet in no one of them was the advocacy of change strong enough to overthrow the established order of things. Nevertheless, when the new University of Strassburg came to be established, the advocates of division once more carried the day. Though it might not be wise to change radically an organization already established, it still seemed best to the Government in the founding of a new institution to recognize the force of the argument in favor of separate organizations. The new university, therefore, was given not only a philosophical faculty, but also a faculty of mathematics and the natural sciences.

The universities of Tübingen and Strassburg are the only ones in which a complete division into separate faculties has taken place. In four of the universities the question was decided by adopting what may be called a medium course. These were the universities of Munich, Würzburg, Bonn, and Leipsic. At Munich a plan was adopted by which the faculty was to maintain its integrity for the discussion and decision of all questions of general policy, while at the same time it should be divided into two sections for the purpose of administering affairs of more specific interest. One section has charge of all matters pertaining to philosophy, philology, and history, while the other devotes itself to the interests of studies in mathematics and the natural sciences. Each section is organized under the direction of a dean; and the senior of the two deans presides at the meetings of the general faculty. A similar method of organization prevails at Würzburg, except that one dean only is chosen, whose duty it is to preside not only over the whole faculty, but also over each of the two sections whenever they are called upon to act in their separate capacities. The dean is chosen alternately first from the one section and then from the other. At Bonn and at Leipsic the question of organization was settled in a somewhat different manner. As early as 1834 a number of embarrassing questions touching the privileges of certain departments of study led at Bonn to a careful consideration of the matter of faculty organization, and the differences finally resulted in a compromise which, from that day to this, has remained undisturbed by any modification. The faculty preserves its integrity as a whole for the transaction of all business of a general character. For the superintendence of the work in the several branches of study, however, it is divided into four sections, each one having its presiding officer. Of these sections, the first has charge of all matters coming under the head of philosophy; the second, those pertaining to philology; the third, to history and political science; and the fourth, to mathematics and the natural sciences. At Leipsic the division is the same, except that philosophy and philology are grouped into one section or school. It is worthy of note that this plan of organization, in the course of the forty-five years that have elapsed since its adoption, has been so successful in its workings that no official proposition for changing it has ever been made.

At the inauguration of Prof. Hofmann, not long since, as Rector of the University of Berlin, the subject of his address was "The Question of Dividing the Philosophical Faculty" (*Die Frage der Theilung der philosophischen Facul-*

tät). The several phases of the subject were considered at length. The author had sent letters of inquiry to members of nearly or quite all the faculties of the German universities, the replies to which are published as an appendix to the second edition of his address. They are of very considerable general interest; but the matter of especial importance for our present purpose is the fact that the whole tone of the correspondence lends itself to the advocacy of the method of organization that originated at Bonn. Prof. Hofmann recognizes this drift of what may be called university opinion, and not only falls into the current, but advocates the popular doctrine with characteristic energy and eloquence. He is opposed to the division of the corps of instructors into distinct faculties, for the reason that such a division tends inevitably to intellectual narrowness and bigotry. The chief part of his argument may be described as an elaboration of the thought so well expressed by Goethe in his well-known line:

"Im engen Kreis verengert sich der Sinn."

But while the author deplores the policy of complete division and separation, he fully recognizes the imperative necessity of some change. He insists that it is impossible for a large faculty sitting as a whole to consider adequately and wisely the necessities of individual branches of study. In seeking for a solution which shall at the same time promise the greatest amount of good and threaten the least amount of evil, he arrives at the conclusion that the middle course is the one which ought to be adopted. The integrity of the faculty ought to be maintained for the purposes of general legislation, while the more immediate supervision of the several branches or groups of study should be entrusted to subordinate sections or schools. This method, moreover, has the advocacy of nearly fifty years of most successful experience.

THE FRENCH PANIC.—THE NEW CABINET.

PARIS, February 16, 1882.

WE are going through an extraordinary financial crisis. It has this peculiarity, that it is almost a social crisis; at least, it affects a great part of what is called society—the most frivolous part: the portion of society which is composed of the devotees of chance, which is seen at the races, in the best clubs—the *fast* people. It has also this character, that it affects the women as well as the men, as some ladies had been seized by the mania of the Bourse speculations. Pailleron, the author of the "Monde où l'on s'ennuie," and who depicts the follies of the present day, will have a fine subject if he undertakes to touch this ground. I will not, even by allusion, speak of some of the heroines, who are known to all Paris: it is enough to know that there never have been so many fine collars of pearls and diamonds pawned or sold; that some of the greatest hôtels are to let; that some persons who were the leaders of fashion and who were a part of "all Paris" have ceased to make their appearance; that some of the boxes at the opera are empty, or filled by unknown faces. The women had gone on in this line with their usual want of prudence and their wonted passion; they are the fair victims of the famous "Union Générale." As for the men, they are legion—ignorant clubmen who thought that it was as easy to play at the Bourse as at the card-table; gentlemen who expected to retrieve their fortunes, credulous people who really believed that the new bank could make gold out of nothing.

How can the best heads resist the emotions of the gentleman (he is well known in Paris) who went through these successive stages of fortune? I cite this case only because I happen to have very trustworthy information on the subject. This gentleman was leading a quiet, easy, lazy life, with his paternal fortune of about 600,000 francs placed in five-per-cent. stocks. The Union was founded; he saw in the board of directors some of the best names of France—names which had hitherto been spotless. He took 5,000 shares, on which he paid one-fourth, which was called. This absorbed 575,000—that is to say, his whole fortune. The shares rose, rose, first gradually, then feverishly, under the excitement of a wild speculation. The "Jews" sold; the Union bought its own shares; the shares rose to 3,000 francs. My gentleman was then able to realize 15,000,000 of francs. All his friends urged him to do so. No; the shares would rise higher; he had faith in the enterprise and its leaders. They rose to 3,500 francs, when suddenly the panic came; the Union had bought so many of its own shares that all its resources were gone. Its enemies were advised of it; they sold and sold, and literally threw out of the window, shares which the Union could no longer buy. In a single day the shares fell by the thousand francs. The unfortunate millionaire saw his millions dwindle under him, and in the course of a week he was ruined. He never sold; the crisis was so sudden that he had no time for reflection, and his stupid faith only vanished when everything had vanished. And what is his position now? The syndics of the failure will be obliged to realize the assets, and to make a call for the three-fourths of the shares still unpaid and still subject to call. They will demand from him alone the sum of 2,175,000 francs, which he is absolutely incapable of paying. What will he do? Blow out his brains, like the nineteen men who have already done so since the crisis? A paper keeps the table of mortality of the Union: he would make the twentieth.

Alas! this is one case among hundreds and thousands. Here is a man who, in the course of a few months, rose from ease to great wealth, and sank from this artificial wealth to absolute and irremediable misery. And the crisis is not over; the Union was the drop which made the overflow. It produced a very severe crisis at the Bourse, in the focus of speculation. What must happen now is this. Within a few years a large number of banks of credit and deposit have sprung up everywhere; the eye is met at every corner by magnificent houses, which are the new banks; some are real palaces. These establishments are really no banks at all, in the old sense of the word; they made their profits out of the creation of shares, sold at a premium. These shares represented all sorts of new affairs—mines, railways, etc.—some real, some half-real, some imaginary. The general impetus given to business for a number of years favored this movement; people were talking in hundreds of millions; it seemed as if capital were a thing which was created by spontaneous generation, not by economy and by work. Now this state of things is reversed; universal confidence has been replaced by universal fear. It would be impossible to float new shares, to attract the money of the public to any new enterprise.

What will become of these new banks of credit? Such as have received deposits from the public will see all their deposits withdrawn, either slowly or rapidly, according to the degree of confidence which they inspire; their profits will become reduced to nothing, and their general expenses, which are enormous, will remain the same. It is impossible that all of them should withstand the pressure of these adverse circumstances. We are, therefore, likely to see a bank crisis coming after the present Bourse crisis. The third act of these natural evolutions is generally a crisis in real estate. During the last few years Paris has built for itself new quarters; the price of land has increased enormously. Many men with borrowed money, many companies formed with the money of the public, have built gigantic houses, great streets lined with modern palaces. The rents asked for the apartments in these new houses are very large, as they must cover the interest and the sinking fund of an extravagantly large capital. At the present moment there is a great number of these apartments still unoccupied. The proprietors counted upon the continuation of the extraordinary prosperity which the country has enjoyed during a few years; but a crisis at the Bourse, a crisis of the banks, will soon force them to reduce the price of rents. Many of the new building-companies will become bankrupt, and there will be a depreciation of the value of real estate in Paris in a year or two. These grave events have completely thrown politics into the shade. Their consequences come home almost everywhere; the financial "Krach" has produced much more effect than the political "Krach." Gambetta has vanished almost out of people's minds; he has gone south, as if he wished himself to be forgotten, at least for a little while.

How much philosophy there is in the exhibition of caricatures in the kiosks of the boulevard. I remember that after the amnesty, when all the Communists and exiles came back, the Gambettists were very bitter against the author of the *Lanterne*, Rochefort, as if they feared his influence over the people of Paris. One of Gambetta's organs published a letter written by Rochefort to M. Thiers, when Rochefort was in prison at Versailles and appeared before a council of war. A violent quarrel broke out on account of this letter. Rochefort denied its authenticity; said that it was a mere draft of a letter which was taken from him by his lawyer, but which was not to be delivered to M. Thiers. The Gambettist papers insisted that Rochefort had intended to beg M. Thiers to pardon him. In one of the caricatures of the time Gambetta was seen, in the dress of *Hamlet*, holding in his hand the head of Rochefort, looking, as usual, very worn and ghastly. "Alas! poor Yorick!" said Gambetta. My eyes fell, a few days ago, on a paper in a kiosk. There was now Rochefort, with a plume in his hat, and a flowing mantle; he had in his hand the head of Gambetta, with one eye dilated and almost falling out, the other eye gone—"Alas! poor Yorick!" Such is the mutability of history. There is no doubt that Rochefort made a terrible war on Gambetta and the school of the Opportunists; he was unsparing, ferocious, like a red Indian. Gambetta was attacked with more art and apparent moderation by Jules Simon, his old adversary at Bordeaux. Jules Simon took, for this object, the editorship of the *Gaulois* (the paper which is publishing the new novel of Zola, 'Pot-Bouille'), and every day he wrote an article against Gambetta. These articles were, in a literary sense, very curious. Their form was quite new; they were not dry and dogmatic; they assumed the tone of an easy conversation at the fireside. Some of them had almost the brilliancy of Prévost-Paradol.

Still, the opposition of Rochefort and of Jules Simon would have been of little avail against Gambetta, if the latter had not turned against himself the Chamber of Deputies. He offended the Chamber in its dignity and in its interests. By attacking the *scrutin d'arrondissement*, he offered the Chamber an insult which it would not forgive. He said one day, in a moment of anger, that the Chamber was composed of "sous-vétérinaires" (assistant horse-doctors), meaning that the *scrutin d'arrondissement* had brought to the surface only mediocre men, under-educated, ob-

scure, with no general views. It is quite true that the Chamber is chiefly composed of the politicians of the provinces, who have most of them their fortune to make, and only four years to make it in. But if under a monarchy it is necessary to put up with a bad king, it is necessary under the Republic to bear with a bad Assembly. Gambetta could not dispense with this Assembly, and he showed too soon his contempt for it; he incurred its ill-will instead of ruling it and conducting it. He thought himself too strong, too indispensable; the Chamber soon proved to him that the instinct of self-preservation was much stronger than the devotion and admiration which the Republicans had professed for Gambetta during the elections.

The new Cabinet has inherited a very delicate situation. Its strength is purely negative: it will live by the fear which the *scrutin de liste* has created in the ranks of the majority; it will live by the fear of a possible return of Gambetta, by the alarm which his active foreign policy has created in the community. If there is a strong sentiment in the nation, it is the dread of any complication outside. The Freycinet Cabinet has straightway turned the Egyptian Question into a European question: it will not send a soldier or a ship to Alexandria. We continue with England the financial *condominium*, but the Controllers have virtually ceased to be the masters of Egypt. Arabi Bey and the National party will have it all their own way. France falls back and says to Europe: "Egypt is not on my frontier; it is not Tunis. I will remain in Tunis, but do as you please in Egypt; you will have my good offices, but nothing more."

THE FIRST DEBATES OF THE SESSION.

LONDON, February 23.

PARLIAMENT had been sitting for nearly a fortnight before the debate on the Queen's Speech, which, as you know, is delivered at the opening of each session, could be brought to a close. In better and less troubled days it was generally despatched in a single evening; but we have changed all that, and now make it an occasion for attacks on the vulnerable points of ministerial policy and demonstrations against all the rest. This year, like last year, Ireland has been the main theme of discussion. Those who thought that the Land Act of last year had procured for England and Scotland a respite from Irish questions for some time to come, and that we should be left free to attend to domestic legislation, are already beginning to realize their mistake. Ireland is still with us and upon us, an ever-pressing difficulty. Irish members and subjects are likely to go on absorbing a large part of the time of the country and its Ministers. As regards its Irish policy the Government has been subjected to a cross-fire. The Parnellite or Nationalist party complain bitterly of the fact that 512 persons, arrested on suspicion under the act of last session which suspended habeas corpus, are now lying in various Irish jails, and threaten that their continued detention will only more inflame the country. While not venturing openly to justify the outrages on private individuals, chiefly farmers who have paid their rent or taken farms from which others have been evicted, they represent these lawless acts as the natural consequence of the irritation produced by the severe action of the Government, and especially of the popular distrust in the good intentions of those who have imprisoned such leaders as Mr. Parnell and Mr. Dillon. So far from professing gratitude for the Land Act, they declare it to be a wholly inadequate remedy; represent the reduction of rents as insignificant; insist on the hardships of tenants already in arrears whom the landlords may evict. And behind all, they not only repeat the old demand for a separate Irish Parliament, but intimate that even the separate Parliament may not be a sufficient concession, and that, in the long run, nothing less than absolute independence will solve the problem. Such language is, of course, seized on and used by the Tories, who attack the Government from the opposite point of view. According to them, the mistake of the Government has been, not severity, but leniency—misplaced leniency in the first instance, which permitted the land agitation to rise to proportions so formidable that even the recent severities have not availed to stop it. "If habeas corpus had been suspended earlier," they say, "if the Land League had not been encouraged by the language which members of the Government employed, our present troubles might have been avoided, and such a revolutionary measure as the Land Act would not even have appeared to be needed."

In condemning the Land Act itself they add two new arguments against it, both of which have produced some effect on public opinion, at least in the upper classes. One is drawn from its working. The judges of the Land Court and assistant commissioners working under them are accused of having dealt harshly with the landlords, of having gone quite too far in reducing rents—of having, in fact, behaved rather as political partisans than as judges. And the other is founded on the fact that, despite the Land Act, the country remains disturbed. "The only ground, say they, "on which you obtained from Parliament this extraordinary change in the law—this measure which unsettled the rights of property and violated plain principles of political economy—was your declaration that nothing less could satisfy the Irish people, your promise that it would act as a sedative under whose genial action sedition and murder would decline and vanish. No such effects have followed. Things are as bad as they were before. You have to keep over five hundred people in jail. Your military and police garrison in Ireland is larger than ever. You have incensed and plundered the upper classes without satisfying the lower. We have sacrificed our brother landowners in Ireland, we have abandoned our cherished principles of legislation, and all in vain. Life and property are just as insecure; the cry for separation becomes louder; you have exhausted your prescriptions, and have no further remedy left." These reproaches produce some impression, and would produce a much deeper one if the Tory leaders had any alternative policy to suggest. But this they neither have now nor have had at any time during the last few years. They say, of course, that it is not their business to do so; that the duty of an Opposition is merely to criticise. Still, as an Opposition is always a government *in posse*, it becomes material to know what the present Opposition would do if it were placed in power; and this they have hitherto not indicated, except by general declarations that the unity of the Empire and the sanctity of property must be upheld.

Whether they would even adhere to the Land Act of last session seems doubtful after the last move which the Conservative leaders have made. The Land Act has now been in operation since last October. A great army of assistant commissioners have been appointed and set to work in hearing the applications of tenants for a reduction of rents—applications based usually on the allegation that they, and not the landlords, have improved the land. In a large majority of cases the rents have in fact been reduced, and ample evidence has been produced that in many cases landlords had screwed up the rents to a point at which the tenant could barely exist. So far, the Act has been justified, and the conduct of the commissioners approved, by those who passed it. But the landlords of course look on the result with far different eyes. They had already suffered seriously in pocket by the default of many tenants to pay rent during the last two or three bad seasons. They now see their income permanently cut down by the reductions which the commissioners are carrying out, while not only the cost of living remains the same, but the charges payable out of their lessened incomes, such as the interest on mortgages, or annuities to brothers or sisters, have not been proportionately reduced, and press very heavily on them. There has been a great deal of positive distress among the minor landlords, which furnishes some palliation for the impatience and violence with which the Land Act and those connected with it have been assailed. Some have urged that compensation should be made from the public treasury to those whose rents are reduced; but as this would involve the absurdity of treating best those who have raised their rents highest, it is felt to be impracticable. Another suggestion is to diminish the interest on mortgages and other similar charges in proportion; but the practical difficulty of doing this so as to be fair to everybody would be immense, and people recoil from so great an interference with ordinary contracts as the reduction of interest on a mortgage loan.

In this state of general discontent and irritation, the Irish landlords, who are, with few exceptions, strong Conservatives, moved in the House of Lords for a committee to inquire into the working of the Irish Land Act. The Government opposed the proposition, declaring not only that it was ridiculous to pull up the young plant before it had begun to strike root, but also that such an inquiry could not fail to alarm the minds of the Irish tenants, and still further unsettle the country. However, the motion was supported by the Conservative leaders, who always command a large majority in the House of Peers, and carried easily after one night's debate. When it had been carried, people began to perceive what serious consequences it might have. The House of Lords is, of course, quite powerless to reverse any legislative action of the House of Commons—so powerless that it did not even venture last year to reject the Land Bill, which it heartily detested. All it could do in this case would be to inquire—that is, to appoint some of its number to call witnesses from Ireland, landlords and tenants, commissioners and assistant commissioners, question them, and report the results of the evidence it had taken, with such suggestions as it pleased to add. No change in the law, or in the action of the Executive, need follow. But the committee would have virtually erected itself into a sort of court of appeal from the Land Commission, would have interrupted its work by summoning its officers as witnesses to London, would have created a feeling that the commissioners were liable to be interfered with, would have made the tenants think they held their lands and paid these lower rents under the old insecurity. In fact, the objections to such an inquiry as the House of Lords had decided on were recognized by moderate men of both parties to be so grave that it was thought the Lords would perhaps repent and recede.

They were not allowed much time for repentance. Their resolution was passed on Friday night, and on Monday Mr. Gladstone gave notice that he would move a resolution in the House of Commons disapproving of any such inquiry at present, as calculated to increase the difficulties of governing Ireland. Such a slap in the face by one House to the other, although not quite without precedent, is rare in modern times, and has, of course, intensified the already prevailing excite-

ment. The House of Commons has a strong corporate spirit which makes it rather enjoy a tussle with the Lords, and the conduct of the latter is generally thought unwise, so that the Ministry may count pretty confidently on the support of their followers. But people ask whether it would not have been better to defeat the committee in some quieter way: whether obstacles could not have been interposed to its sittings, or to its getting the assistant commissioners to come over from Ireland as witnesses; whether, when a little time had elapsed, the project would not have been suffered to drop by its own promoters. "Is not this," they say, "another instance of Mr. Gladstone's impetuosity, which goes too quick, if not too straight, to his mark?" Of course he may be able to show that the state of Ireland is so delicate that an immediate demonstration against the evident wish of the Peers to reverse the policy of the Land Commission is necessary. But in any case the expenditure of time which the discussion of his resolution will involve, must add to the perplexities of the Government. They have kept back all their important bills until the new rules for the procedure of the House of Commons shall have been passed. The first of these rules, that providing a means of putting an end to a debate similar to your "previous question," has been just introduced. It meets with great opposition, and will be discussed for several nights. Other rules sure to provoke long debates follow. The Easter vacation may arrive before these rules have been disposed of, and they will not be finished even then if a great debate on the Irish land question is interposed. Now, the one thing by which the Ministry must preserve, or regain, its credit is the passing of some substantially useful measures. All that goes wrong is charged on the Ministry in power; excuses, however just, are unheeded, results alone impress the public mind. If, therefore, the present Government fails to carry through a good part, at any rate, of the reforms which it promised, that reaction which is always more or less in progress against the Executive will advance apace, and the next general election, reducing the Liberal majority, will leave the two English parties equally balanced, and make the Parnellites, whose numbers a general election would doubtless swell, masters of the situation. This is a prospect that might be expected to mollify the minds of English Tories and Liberals, and dispose them to arrange their differences. But party feeling is far too bitter now for that, nor are there any signs that its bitterness will lessen. Y.

THE CHANGE OF MINISTRY IN EGYPT.

ALEXANDRIA, February 14.

THE fall of Sherif Pasha's Ministry will have been known by telegram long before this letter appears, but the telegraph never proves its insufficiency as a means of communication more remarkably than when it endeavors to convey Egyptian news. In the first place, it tells either too much or too little. In the second place, it necessarily omits all the qualifying circumstances and subtle modifications which are the main staple of Oriental politics. In the third place, the telegraph is usually resorted to while the news is yet only half-fledged, and has not had time to prove that it is no news at all. During the late political crisis nothing could contrast more signally than the complacent temper and undisturbed repose of the European population in Egypt—that is, both in Cairo and Alexandria—and the alarm of readers of English newspapers in England. Though, however, there never was any cause for a moment's real disquietude for the safety of the European settlers in this country, the late events have such an important bearing on the state and near future of Egyptian politics, that it is well worth while examining them with some care, and describing the condition of European opinion here in respect of them.

It will be remembered that Sherif Pasha's Ministry, which has just fallen, was the creature of the military *émeute* which took place last September. It was supposed to be the chosen instrument of the military leader, Arabi Bey, and his friends, and to express their dislike to Riaz Pasha, as representing preëminently the political intervention of France and England. I mentioned in a former letter that it was expected that the session of the Assembly of Notables would result in a conflict of opinion regarding the financial administration. This Assembly has been somewhat magnified in the English papers, and elsewhere, into a popular representative Legislature, and Sir Charles Dilke, not to say the authors of the Queen's speech, showed some disposition to pat Egypt on the back as making its first playful sallies in the direction of popular government. Indeed, the pretentious name, "the National Party," has, like other misleading political titles in other countries, done much to foster a wholly ungrounded belief that party organization in Egypt has reached something more than the most embryonic, not to say the most microscopic, of forms.

The fact is that the elections to the Chamber of Notables were conducted in the most high-handed and superficial of methods, the electors caring little and knowing less about the matter, and the elected, as likely to incur considerable inconvenience from their forced residence in Cairo, being therefore the reverse of solicitous about the matter. I am told on good authority that a very small proportion of the House, of something less than a hundred members, can either read or write—though, of course, this incapacity means less in an Eastern than it would in a Western country. Nevertheless, this body undoubtedly got to work in a business-like sort of way, and, after complimentary and ceremonious overtures on the part of the Khedive, they addressed themselves to the problem of their own permanent constitution and powers. In this way two constitutional factors were brought into opposition: the one, that of this newly constituted body, with its powers and position yet undefined; the other, that of the executive government, led by Sherif Pasha, and weighted by its relationship to what is known as the European Control.

This Control is exercised by French and English representatives, according to the terms of the Decree of November 15, 1879. The Controllers-General "have in financial matters the most complete powers of investigation into all the public services." They "have the rank of Ministers at the Council, and a seat and consultative voice there." The Minister of Finance is bound to "furnish the Control every week with a detailed statement of all receipts and expenditure." This being so, Sherif Pasha, with every desire to gratify those who are adverse to European interference—that is, the strictly limited, but very noisy, number of persons known as the National party—had his hands tied, and could do no more than concede to the new Assembly such powers as could by no possibility interfere with the Control as guaranteed by the Decree of 1879. However, Sherif Pasha and his Council and Ministers did their best, and on a joint committee being appointed to discover terms of arrangement, finally offered as his ultimatum the following concession: Ministers were to be jointly and severally responsible to the Assembly for all acts which might infringe on its rights. The Assembly was to be at liberty to discuss and vote all laws submitted by the Ministry, and to express an opinion on the Budget. No new tax, direct or indirect, could be established in Egypt without having been voted by the Assembly. "Neither Tribute, Public Debt, nor any charges on the country arising out of the Law of Liquidation or any international contract, were to be discussed." The issue was taken on the clause excluding the Assembly from the abstract right to plenary financial interference, and Sherif Pasha resigned.

A new Ministry was immediately formed, and it might be supposed that it entered upon its work prepared to make all the concessions to the Assembly which Sherif Pasha resisted. But, so far as any light is thrown on the situation at present, it does not seem that the terms of the new Constitution will threaten the guarantees for the Public Debt. In estimating the constitutional and political relevancy of this crisis, it will be a great mistake to make a free use of the analogies supplied by more advanced constitutional countries in the West. It is believed here, among persons well able to form an opinion, that little more is meant by the change of Ministry than a desire on the part of the incoming Government to take the place of the outgoing, and a successful raid accomplished in pursuit of that desire. The new Ministry and the leaders of the Assembly, in their public utterances, have striven with each other to manifest their respect for the financial obligations of the state. In fact, it is creditable to Sherif Pasha that he honestly adhered to the only admissible programme, and he is the unfortunate victim of what seems to be little better than a vulgar personal conspiracy.

The general movement, however, has called out the expression of various opinions on the part of the different representatives of European countries in this city, and also in Europe. It is generally felt that the change is a manifestation of hostility to the Anglo-French Protectorate of Egypt. The Italian organs here, and the Italian Government at home, somewhat rejoice in this. The French colony here have little cause for affection for Sherif Pasha, though its members are careful as to how they express themselves in view of the susceptibilities which are aroused in connection with French aggression in North Africa. The English public here and its organ, the *Egyptian Gazette*, seem quite prepared for the obtrusion of any amount of English influence, and regard the loyal support of the Control as the first duty of the new Ministry. But this policy seems hardly to be favored by the English Government at home, if Sir Charles Dilke, the Parliamentary Under-Secretary for Foreign Affairs, is its adequate exponent. He, in a recent speech, justly imputes the creation of the Control to Lord Salisbury and other Conservative adversaries. He regards the growth of what he fondly believes to be popular institutions as likely to hasten the time when Egypt can stand alone, and he looks with hopefulness on England's being able to withdraw from Egypt all intervention beyond what is needed for the absolute security of the route to India.

For my own part I do not believe in there being any National party in the sense which this expression carries to the Western mind. But I believe that the happy use of this form of speech, and the opportunity which the military party, led by Arabi Bey, has to do significant and lasting acts in the name of such a party, however fictitious, may possibly operate as a bulwark against a recurrence to merely despotic institutions. Sometimes a bare accidental anticipation of a great idea, though premature, becomes a substitute and real preparation for the establishment of the idea as a fact. The vision becomes true: the dream of freedom and of greatness makes the nation free and

great. In the present case, the cloud on the horizon, which, already much larger than a man's hand, threatens abundance of rain (a reminiscence which, by the way, the unprecedented downpour this year at Alexandria makes especially congenial), is the usurped military power which really controls the civil Government. If the new Assembly succeeds in vanquishing this, the reign of constitutional government is really begun. If it succumbs before it, or acts only as its tool, the miserable tale of a régime of military nominees will be reënacted as in Rome of old, and must sooner or later compel active European interference. A.

Correspondence.

THE AGNOSTIC'S RELIGION.

To the Editor of The Nation:

Sir: Your apparent inclination (*cf.* editorial on "Agnostic Worship" in *Nation* of Feb. 23) to limit religion to recognition and worship of a personal Deity, as well as your correspondent's ("Agnostic") distinction between religion and ethical culture (*Nation* of March 2) raise the general question of the meaning of religion. Sakya Mouni is said to have defined religion as "the perfect agreement of the will with the conscience"; and it is generally recognized that the philosophical basis of the Buddhist religion is agnostic. John Stuart Mill said:

"The essence of religion is the strong and earnest direction of the emotions and desires toward an ideal object, recognized as of the highest excellence, and as rightfully paramount over all selfish objects of desire. This condition is fulfilled by the Religion of Humanity in as eminent a degree, and in as high a sense, as by the supernatural religions, even in their best manifestations, and far more so than in their other."

The late Chauncey Wright, to whom the highest honor has been accorded by philosophical students for fairness and penetration of judgment, gave the following definitions of religion:

"Religion (subjective) means a man's devotion—the complete assent and concentration of his will—to any object which he acknowledges to have a right to his entire service, and supreme control over his life. Religion (objective) means the object or objects whose claims to this supremacy are acknowledged. An irreligious man is, then, first, one who acknowledges no supreme end or objects; or, secondly, one who, though he acknowledge, does not habitually submit his will to such a power" ('Letters of Chauncey Wright,' ed. by J. B. Thayer).

Dr. G. Stanley Hall, in the January *Princeton Review*, without essaying any complete definition, gives an admirable statement of what is, to our mind, the common and essential as opposed to the variable and secondary features of religion, in the view of it as "the popular culture of the highest ideal as opposed to material utility, which dominates so many of our intellectual interests, by reconformity of life to it. It may be formulated as unity with nature, as the readjustment of conduct to conscience, as restored harmony with self, reunion with God, newly awakened love for Jesus, fresh insight into his mind as new impulse to do his will. *The common element is obvious.*" (The italics are ours.)

Is it, then, impossible that men, though agnostic as to the ultimate nature of things, may agree as to the binding character of the moral law and give an absolute loyalty to the ideal for life and society which it enjoins, and, in obedience to such convictions and purposes, form what may properly be called a religious society? Because Christianity has formulated religion in one way—viz., as involving a relation between man and a personal Deity—is it impossible that it should now be formulated in some other, more consistent with the intellectual temper of the age, and yet be as truly religion? W. M. S.

New York City, March 4, 1882.

[We print our correspondent's letter, while denying that we have said anything to call for it. We have said nothing showing an inclination "to limit religion to recognition and worship of a personal Deity." We have not discussed the question—What is religion?—at all. What we have been discussing is Agnostic prayer. We have maintained that prayer is a petition addressed to a power which can grant or deny it; that there is in the Agnostic system no such power; and that, therefore, Agnostic prayer, like Mr. Miln's, is either an imitation or reminiscence of the old worship, or simple ejaculation describing a sensation felt at the moment of utterance—such as, "Oh! for a little rest," or, "If it would only stop raining!" There doubtless may be a "religious society," or a society "for ethical culture," without such prayer or ejaculation, but on this point we have nothing to say.—Ed. Nation.]

PARTIAL PAYMENT OF FIRE INSURANCE.

To the Editor of The Nation:

Sir: In your issue of February 9 you suggest the possibility of introducing in this country the plan in use by French fire-insurance companies of paying no insurance upon the house in which a fire originates. It seems to me that a compromise between this and the usual plan would act almost as powerfully—one may say practically quite as powerfully—as an incentive to care on the part of the proprietors, while sacrificing far less of the benefits of fire insurance than does the French plan. If the company paid only half the loss sustained on the premises in which the fire originated, the proprietor would feel hardly, if at all, less anxious to adopt all necessary precautions than if the loss would be total; and probably even the deduction of one-fourth of the amount of loss would be quite sufficient to serve the purpose. Of course, a very grave objection to the French rule is, that it goes a great way to destroy the security which is the cardinal object of insurance; a compromise such as has been suggested above might reduce this objection to a minimum, while effecting almost as fully the purpose for which the rule is designed.

Yours, very respectfully, F.

Baltimore, Feb. 28, 1882.

INSURANCE OF ANIMALS AGAINST ACCIDENT.

To the Editor of The Nation:

Sir: The insurance of animals against accident is a regular business in our times. I am not enough of an antiquarian to know whether there is any recorded instance of the practice older than that mentioned in the following instrument, now in my possession (the Norwich mentioned in the agreement is in Connecticut).

Very faithfully yours,

Edward S. Holden.

Washburn Observatory, University of Wisconsin, Madison, March 2, 1882.

"This agreement or Covenant made & Concluded This first Day of June 1790 Between Doctor Lemuel Buswell of Norwich on the one part & Ph. Holden of sd Norwich on the other part Witnesseth—That the sd Buswell on his part hath This Day Delivered to the sd Holden Two three year old Cows of a midling size & Bigness without Calves to be sd Holdens proper Estate and he sd Buswell Doth hereby—Warrent Their Lives against Lightning—and that only for the Space of six years from the above Date—Said Holden on his part Doth promise Bind and oblige him Self and heirs to Deliver to the said Buswell four Cows not Less then three years old nor more then Seven yer old of a midling Size and bigness to be sd Buswells proper Estate. Said four Cows to be Deliverd to Said Buswell or heirs at the End of Six years from the above Date and to be without Calves—and for the True performance here of We have hereunto Interchangably Set our hand ye Day & year above Writen.

"Phinehas Holden
"Lemuel Buswell

"Signed & Deliverd }
In Presence of us }
"Jonathan Smith
"Anne Buswell."

THE PENSION ARREARS ACT.

To the Editor of The Nation:

Sir: The following facts, in a somewhat different form, have already been brought to the notice of two members of Congress; but I have thought it advisable to lay them also before the public in the columns of a paper which has never yet shrunk from the disagreeable task of exposing fraud in all its forms. It is certainly the duty of every right-minded citizen to do all in his power to prevent the consummation of this stupendous raid upon the national treasury, the prospect of which is serious enough to fill every mind with alarm. Writing from a village of barely 150 houses, the number of facts which I present must of necessity be small, but I am confident that if the same inquiry were extended to other places, the results would be the same. Moreover, it does not need many facts to prove what might easily be reasoned out *à priori*.

There are three families in this town whose claims upon the Government purse admit of no dispute. One of the soldiers representing these families was killed in battle, a second died at Andersonville, and a third was severely wounded and disabled. To none of these families has the Arrears of Pensions Act been of the least benefit, for the simple reason that they experienced no delay in securing their pensions. Their claims being admitted from the first, and promptly granted, there was no "back pay" to call for when the act was passed. It is safe to say that, in ninety-nine cases out of a hundred, the same is true of all those families who have rendered unquestioned service to their country, and whose members yielded up their lives and health in its defence.

I come now to a class of cases where the Pension Arrears Act was of benefit; and what are they? A person returns from the war, and after a few years dies of consumption; another discovers on his return home that he is subject to epileptic fits; a third comes back minus two or three fingers, which he had lost while cleaning his gun. In all these cases there was of course considerable delay, partly for the reason that the claims were not immediately pressed. Indeed, in most cases of this kind it will be found that it was the pension agent himself who took the initiative in proffering his services. Then there was the difficulty of proof, which in some of them was by no means small. It is a significant fact that one of them was considered too desperate to attempt seriously until the Pension Arrears Act itself, with the large sum involved, made all obstacles seem light. Now, whatever delay there was in all these cases was owing to the uncertain character of the claims themselves, the one being proportionate to and a direct index of the other. The Pension Arrears Act ignored this fact, and placed both doubtful and valid claims upon the same footing. It

needs no argument to show the great difference between the services rendered in the two classes of cases, and yet the reward was in the end the same ; with the odds even in favor of the latter, because the money came all at once. The delay was not felt by the claimants themselves to be an injustice. They were abundantly satisfied with what they had secured, and the arrears of pension came to them in the shape of an unexpected boon.

I have a single case that may at first sight seem an exception to the above. It is that of a person whose son died, or was killed, in the war. Here, certainly, any delay was unjust. But let us see. The father was one of the class of poor whites common enough in New England, who brought up his children with as little trouble as possible, and got rid of them at an early age. The son in question had not been under his father's roof for twelve or fifteen years, had moved to a distant part of the country, and it was only by chance that the father learned of his death. The mere fact that he was his father entitled him to a pension, although what difference it made to him whether his son was alive or dead would puzzle any one to say. It is one of the many cases in which the spirit of the law was sacrificed to the letter ; in which the suffering was as remote as the connection of interest.

I now come to the third and last class of cases, the direct product of the Act itself. The passing of that Act was like the sowing of the dragon's teeth. An army of applicants has sprung suddenly into existence, demanding a sum of money large enough to form the nucleus of a new national debt. Of this army this community furnishes four, which, considering it includes all the remaining soldiers but one or two, is doing pretty well. Three of these have absolutely no claim whatever. None of them can show a wound or even an "injury to health"; and in one case at least the connection with the army was decidedly remote. None of them ever thought of applying for a pension until the Act was passed, when the success of previous applicants and the large sum at stake emboldened them to make the attempt.

The fourth case deserves a special mention. It is that of a person eighty years old. How he ever got into the army is a mystery. He claimed to have been hit by a shell, but, as his bodily vigor remained undiminished up to the last year or two of his life, the damage could not have been very great. His mental powers somewhat failed him of late years, so that he had forgotten even the officers of his own regiment. The obliging agent opened the book and read out the list of names, to which he willingly assented. He died lately, of sheer old age, but his heirs, I believe, hope to "realize."

Nor have the large sums of money paid out proved in all cases an unmixed good. A single instance will suffice. One of the persons referred to above received $1,700 in a lump. What was the result? Six months of idleness, at the end of which all the money was spent, with almost nothing to show for it. Nor can anything better be promised in case the present applicants are successful. Such large sums of money, for which so little service has been rendered, cannot fail to exert a demoralizing effect upon the recipients. Originating, then, in a false conception, intended to remedy an injustice where none existed, the Pension Arrears Act has worked nothing but mischief from the start ; but whatever effect it has produced up to the present time sinks into insignificance compared with the evil which it threatens to accomplish. If some of the claims already granted have a doubtful ring, what shall we say of those which the Act itself has created? If delay is indicative of more or less fraud (and all the facts mentioned above confirm it), then, in the face of the seventeen years that have rolled by since the war, the great majority of the 300,000 to 400,000 claims now pending stand condemned. The more we study the evidence before us, the more the conviction deepens that we stand upon the eve of one of the greatest swindles the country has ever witnessed ; and for this state of things the Pension Arrears Act is alone responsible. No half-way measures will remedy the evil. To post the names of the applicants in a conspicuous place would have but little deterrent effect, nor will it be safe to leave it to the public to expose the fraud. The Act itself is a direct bribe to deception. Every consideration of justice and economy, of wisdom and patriotism, demands its repeal.

E. S. Cowles.

Farmington, Ct.

Notes.

It is good news that the Rev. B. F. De Costa, D. D., will become the responsible editor of the *Magazine of American History*, having as his assistant Mr. Henry P. Johnston of the New York Free College. We must not, however, forget the eminent services to the magazine and to American history of the late editor, Mr. John Austin Stevens. May we bespeak the attention of the new conductors to the unlovely aspect of the standard page of the magazine—faulty, as it seems to us, in its proportions and in the typographical character?

Charles Scribner's Sons have in press Mr. Froude's biography of Thomas Carlyle, for simultaneous publication with the English edition. In their pretty series of uniform reprints of Dr. Holland's complete works the story of 'Sevenoaks' is the latest issue.

The fourth volume of the "Geoffrey Crayon" edition of Irving's 'Life of Washington' has now left the press of G. P. Putnam's Sons. The Stuart portrait and the Ceracchi bust are among the numerous illustrations on steel of this part of the work. They have added to their previous list of the works of Edmondo de Amicis his 'Morocco,' published by Cassell & Co. some two years ago.

The Messrs. Putnam's new announcements include the long-expected work by Lieutenant-Commander Henry H. Gorringe, on 'Egyptian Obelisks: Their History and Characteristics.' The size will be folio, and the number of plates forty-nine, two-thirds of which are full-page artotypes. The removal and setting up of the Central Park obelisk will naturally be minutely described. The edition will be limited. Another significant work will be 'Our Merchant Marine : its Rise, Progress, and Decline,' by David A. Wells. Add also the following: Alphonse Courtois's 'Political Economy in One Lesson,' translated by Worthington C. Ford, who is preparing for the same publishers an 'American Citizen's Manual'; 'The Present Religious Crisis,' by Augustus Blauvelt ; Leslie Stephen's new treatise, 'The Principles of Ethics'; and S. S. Cox's 'From Pole to Pyramid.'

D. Lothrop & Co., Boston, announce 'The Mother's Record of the Mental, Moral, and Physical Life of Her Child,' apparently a modification of Dr. Fonssagrives's 'Livret Maternel,' already englished in the 'Mother's Register.'

George W. Harlan has in press a translation of Georg Horn's 'Count Sylvius,' this novelist being little known to American readers ; and 'Last Days of Knickerbocker Life in New York,' by Abram C. Dayton.

We have received a touching memorial of the late celebration of Longfellow's seventy-fifth birthday (February 27) in the shape of the programme of the order of exercises at the Perkins Institution for the Blind, at South Boston, Mass., and a dialogue prepared to be spoken by the inmates by Mrs. Julia R. Anagnos. Both these pieces were printed in raised letters on the Howe Memorial Press. The dialogue involves the whole or portions of the poems "Prometheus," "The Building of the Ship," and the "Psalm of Life."

Hardly inferior in curiosity to the foregoing is the Sale Catalogue of the late Prof. Dr. Bluntschli's library, which comes to us from Heidelberg. This octavo volume, of more than 200 pages, is autographically lithographed, but happily in Roman and not in German script. The last number is 2,141, and in the confusion of the entries it appears to be also the highest. Five pages at the end enumerate the works composed by Bluntschli himself, and his learned addresses. Among the latter we notice 'The Formation of the American Union,' 'The Services of Francis Lieber to Political Science and International Law,' and 'The *Alabama* Question.' It were greatly to be wished that this fine collection of works could be secured for America. Of the nine classes into which it is divided, eight are legal, historic, politico-economical, metaphysical, Belles-lettres and miscellaneous fill nearly twenty-four pages. English works are almost wanting.

We have still something to learn of the Germans in the production of cheap books. It is easy to lower the price, but to maintain style and quality and not to forsake cloth covers for paper, is as yet difficult for our publishers. Spemann's one-mark volumes are still an unsurpassed model in this regard, and now the great Stuttgart house of Cotta has begun a 'Library of Universal Literature' (*Bibliothek der Weltlitteratur*), which will embrace in uniform style the works of Goethe, Schiller, Lessing, Shakspere, Molière, Calderon, Dante, Platen, H. von Kleist, Chamisso, Körner, and Lenau. Mr. Christern sends us the first volume, neatly bound in wine-colored cloth, and sold here at forty cents as the equivalent of the mark, with transportation and duties thrown in. It is one of thirty-six to be devoted to Goethe, and makes a beginning of the poems. The form is handy enough for a coat-pocket, the print clear, the paper excellent, the whole tasteful and a real book. The library will be complete in 110 volumes, and subscribers to the whole will receive gratis four volumes of Goethe, Schiller, Lessing, and Shakspere biography; but subscriptions can be partial, or single volumes will be sold, still for one mark each.

From the Messrs. Rivington, London, we have a plump school edition of the First Part of 'Faust,' which many a solitary reader will find helpful, so copious are the notes—too frequent and too minute, one would think, for the best discipline in the language. They are, however, filled with many interesting comparisons, and there are various historical and chronological appendices, with some attempts at poetical renderings. The various stages of the drama are introduced by "arguments."

—The Federal structure of the nation sometimes perplexes science, as well as politics, seeking a desirable end. Just now the National Board of Health, acting in coöperation with the American Public Health Association and with the American Association for the Advancement of Science, is trying to devise a practical method of establishing a general and efficient system of vital statistics. The collection of these incidents—that is, of births, marriages, and deaths—serves two objects: first, they are social statistics, identifying the individuals for judicial purposes—that is, for purposes of record; and then they have a scientific value, in that the individuals appear simply as units, and, being discussed in the aggregate, illustrate the great vital and eco-

nomic curves of national progress. With registration for identification the general Government has no concern: that affects only the States and their subdivisions. But it is of national interest to preserve the other phase of those facts, and to have them arranged for intelligible comparison, not only reciprocally, but with similar figures collected in other lands. Dr. Billings, charged with the study of this matter for the National Board of Health, has reported to that body his conclusions, as follows: That it is best to use the State machinery by paying to the States at the rate of $2,500 per million inhabitants for such statistics as are required. This he estimates to be about half the cost of collection—the States now bearing the whole cost. He would not pay for imperfect work, the receiving authority being the judge. He would make the National Board of Health, or a permanent branch of the Census Bureau, the recipient, and he regards $25,000 as sufficient to begin the work if Congress will authorize it. One great difficulty is that only about half a dozen States have anything like satisfactory registration laws, and for a long time to come the returns cannot be national. But as it is the first step that costs, it is the first step that begins a great work. Nothing will be accomplished if we wait until a perfected system can be applied. There is every reason to believe that the American and British registrars are in substantial accord as to the nomenclature and classification of diseases, and that a report now in preparation when published will supply a uniform plan to be used by the English-speaking and ultimately by the Continental nations. Of the value of trustworthy vital statistics to sanitary and political science nothing need be said; and if the general direction of the project remain with the gentleman whose name has been mentioned, it is pretty certain that the most intelligent and at the same time most practical scheme will be evolved.

—The numerous instances of late in which the Signal Service has predicted (for New England, for example weather) the precise opposite of that which happened, suggests the query whether such misleading is not unnecessarily increased by the present manner of connoting the subdivisions of the national domain. A prophecy applying to a very small area is more liable, if wrong at all, to be completely wrong, than one which covers a larger territory, some part of which may conform approximately to its terms. It will not from any cause be questioned that a uniformity in size of subdivisions is desirable. The difficulty would arise in drawing boundary lines. Should boundaries be geographical and follow divides (as on the present weather maps), or social and political (as in our atlases), or meteorological, with reference to the average direction of atmospheric movements; or should they be opportune to what is likely to prove lucky? As between these four conflicting methods, the real purpose of the service would be best subserved by what might be denominated opportunism. But, before this could be adopted, the style of subdivision third in the order just enumerated would most likely have to be experimented with. Its application would consist in paying exclusive heed to the quarters from which storms first enter the United States, and naming subsequent regions by eight-hourly progress from these starting points. Thus, in winter, when storms originate on the water, and therefore the Pacific and Gulf States have the initiative in them, the first eight hours' average journey from either coast might be termed the Windward District; and the last eight hours', comprising, perhaps, the eleven States northeast of a line drawn from Cleveland to Washington, the Leeward District. In summer, Kansas, Nebraska, and Dakota would constitute the Initiative District. But no system can succeed under the present arbitrary custom of "reducing" barometric readings to what they "would be" if a place were at sea-level and of standard temperature. Under this custom, areas of low pressure will always seem to suffer grotesque changes of all kinds—direction, size, and unity—whenever they advance to regions where conditions will require them to incur a great "reduction." So long as this manipulating of the figures is considered necessary, the safest manner of dividing (safest not merely for the reputation of the leaders but for the profit of the led), would be empirical: let districts where experience has shown most errors to be made be either cancelled, or apportioned out among the neighboring divisions—as in political gerrymandering.

—It has been difficult to make out from the accounts of Mr. Wilde's appearances in Western cities whether he was really having a nice æsthetic time, or whether the coarse, unfeeling vulgarians among whom he was laboring were "making it hot" for the æsthete "under the old Flag." All doubts, however, have been set at rest by the æsthete himself, in a pleasant letter addressed by him to Joaquin Miller, whom he met and loved in this city, and now, it seems, even in far St. Louis, yearns to meet again. For himself and "the cause" he says he has "no fear as regards the future," and the reasons he gives are strongly put. He admits that in one or two insignificant towns there has been some "petty and profitless vulgarity," but he declares that he should think it as absurd to regard this as an indication of the "real spirit of a sane, strong, and simple people" as to "judge of the strength and splendor of sun and sea by the dust that dances in the beam and the bubble that breaks on the wave." "Slaver and folly," says Mr. Wilde in his simple early-English way, "have their way for a season," but his time is much occupied, and he has none to waste on "the few provincial newspapers which have so vainly assailed me." He has a few incidental remarks to make, however, on an "ignorant and itinerant libeller of New England," who, it seems, has been "lecturing from village to village in ostentatious isolation," though in connection with what lyceum bureau Mr. Wilde does not say. He does not mention his name either, but describes him as a "literary gamin," and his talk as mere "brawling," "mouthing," and "chatter." He expresses a desire to know who "this scribbling anonymuncle" is, that he "should write of him"—a question which, however, hardly calls for a reply from Mr. Miller, as it is unlikely that he can furnish any information of which Mr. Wilde is not already in possession. In fact, what Mr. Wilde does not know about him may be described as not worth knowing. He is, it seems, an "apostle of inhospitality," and, worse than this, "delights to defile, desecrate, and to defame the gracious courtesies he is unworthy to enjoy"; and Mr. Wilde asks Miller to tell him how, "youth being so glorious, art so godlike, and the very world about us so full of beautiful things, and things worthy of reverence, and things honorable," one should stop to listen to the "lucubrations" of this person. How indeed? But his name ought to be given. He cannot really be an anonymuncle. There can hardly be more than one such creature in the lecture field in what Mr. Wilde handsomely calls "grand old Massachusetts." If the following rather pointed inquiry addressed by Mr. Wilde to Mr. Miller—"Who are these scribes who, passing with purposeless alacrity from the police news to the Parthenon, and from crime to criticism, sway with such serene incapacity the office which they so lately swept?"—is intended to cover his case, it would look as if the fellow stuck at nothing. His being a criminal is not, perhaps remarkable, and that may account for his interest in police news. But why should he sweep out offices? Can Mrs. Howe throw any light on these points? The letter will be interesting to her, for it contains not only this strong, manly denunciation of his Massachusetts slanderer, but a suggestion here and there of possibilities in the way of that charming innocent prattle which so delighted his Boston hostess. But at this, of course, he is better when anonymuncles do not rouse him to indignation.

—A law passed some years ago to define more particularly the status of the staff corps of the navy has recently been the subject of administrative interpretation, with the result of causing such a rearrangement of the junior medical officers as could not have been originally contemplated, and as works in the case of many a grievance and, it would appear, in the eyes of nearly all, an unfortunate change. It has been the custom, founded on orders and enactments, since 1824, for newly-appointed assistant surgeons to take rank with each other according to the time at which they passed the examining board, all those entering within one year being regarded as the class of that year. After three years they are reëxamined to determine their fitness to remain in the service and to receive further promotion. They thus become "passed assistant surgeons." Now, it has been the custom to make this examination also a test of the comparative as well as the absolute merits of these officers, and to assign them positions of relative seniority by commission accordingly. Of this they were apprised upon entering the service, and it is supposed that the prospect of gaining or losing rank, as the case might be, has had a beneficial influence upon their habits of study and their professional life. The legal question, however, having been raised, the Attorney-General decides that the law of 1871, enacted for a different purpose, by its terms forbids any rearrangement among themselves of those once commissioned. As they were appointed in the order of time, so must they remain, irrespective of the action of any later examining board, only provided they can reach the minimum degree of merit that permits their retention. Hence, to take a suppositive case, the man who enters in February of one year must take precedence over him who entered in November of the same year by as many numbers as there have been successful intermediate candidates, although the November man may stand first and the February man eighth in order of merit as determined by the triennial examination. Naturally, those who lose rank by this new reading of the eleven-year-old statute feel aggrieved—for the whole list of passed assistant surgeons is being rearranged—and, as becomes high-spirited men, it is said that most of those who would be helped by it are indisposed to avail themselves of its provisions. The officers interested are seeking legislative action to make the existing law conform to the ancient usage, which it would seem the interest of the service requires; and, as no appropriation of money is involved, it is probable that a temperate and simple explanation of the facts would lead to the asked-for relief at the hands of Congress.

—The Cologne *Gazette* of February 11 contains an article on Berthold Auerbach by one of his most intimate friends, Paul Lindau, in which the following points are of interest. Until within two or three years, Auerbach had preserved a youthful freshness and vigor quite remarkable for his years. Then suddenly, almost in a day, he became a decrepit old man, propped on a heavy cane, short of breath, and evidently de-

sirous of the end. Hardly another man was so painfully affected by the anti-Semitic agitation as he, the Jew and German poet. To this topic he ever recurred with fresh complaint. At one of their last meetings Lindau urged him not to make it so much a personal matter; but Auerbach replied, "You cannot really understand how it does affect us. Here we have toiled all our life in the service of the German spirit, only to be told at the end, by the first vagabond: 'Pack up your bundle and clear out; you are not one of us.'" It was characteristic of Auerbach to attach importance to seeming trifles and make them an object of serious consideration. To this peculiarity his conversation owed much of its charm and suggestiveness. It was impossible to be with him five minutes without getting a picturesque simile, clever comparison, or happy thought to carry away in the memory. And these suggestive expressions were not in the nature of *aperçus*, but the product of incessant mental activity. Careless, every-day observations never crossed his lips. All he spoke was manuscript ready for the press. His invitations, congratulations, condolences were not of the stereotyped pattern, but partook of his individual peculiarities. Although hardly more than of medium size, there was something patriarchal about his whole appearance. He spoke slowly and cautiously, and even in a tête-à-tête he appeared to be addressing a large circle of hearers. In his dress he was peculiar—his coat always buttoned up to the neck—and Lindau says he could hardly imagine him in an overcoat of the period. Among his friends whose memory he especially cherished were Uhland, David Strauss, the sculptor Rietschel, and Ferdinand Hiller; and he was intimately associated with all the artists and authors in Berlin. He did not undervalue his own gifts, and often manifested his convictions on this point in a harmless and naïve manner. His slightly South-German accent he carefully and intentionally preserved to the end of his life.

—In the issue of January 28 the *Gegenwart* begins a series of articles in which prominent politicians, authors, savants, and artists are to give accounts of their experiences—their successes and failures, the circumstances under which their principal works were executed, their general aims, etc. The first of these *Autokritiken* is by Ernest Legouvé. It is entitled "Von meiner Collaboration mit Eugène Scribe," and gives some interesting details concerning the manner in which Scribe received and acted upon the advice of his friends in dramaturgic matters. The principal advisers of Scribe and of Legouvé himself were the young Mahérault, son of the director of the Théâtre-Français, and Germain Delavigne, brother of the distinguished dramatist. Germain and his brother Casimir used to meet Scribe every Thursday to discuss plans for new plays, criticise manuscripts, and exchange hints or even subjects—as, for instance, the "Diplomatist," the plot of which Scribe had obtained of Casimir in return for his "Princesse Aurélie." One day Casimir came to Scribe in great mental agony because he could not find a situation for the last act of one of his plays. Scribe replied that he was just completing a vaudeville the dénouement of which would equally suit his piece. It was accepted, and the public did not discover the fraud, although the comedy failed, whereas the vaudeville proved a success. Scribe was always ready to profit by every good piece of advice, but impatiently rejected whatever seemed to him trivial or inconsistent with his talent and style. Germain, after hearing a new piece, was immediately ready with his criticisms, whereas Mahérault always took the manuscript home and made a careful examination of it. Legouvé is in possession of a number of note-books containing his analyses, often of ten or twelve pages, of manuscript plays by Scribe.

—The meeting of the Royal Astronomical Society in January was largely devoted to the discussion of a paper by Mr. Maunder, of the Greenwich Observatory, on the employment of photography in observing the transit of Venus in December next. Attention was called to the fact that the coming transit would occur at very nearly the epoch of the maximum solar activity, with every probability, therefore, that there would be a fair number of spots and faculæ—the chief feature of Mr. Maunder's paper being the suggestion that these markings should be used as reference-points for the planet, instead of measuring the distances from Venus to the sun's limb, as was done with the photographs of the transit of 1874, which (in the case of the English parties) gave most discouraging results. It does not appear, from what the Astronomer Royal said on that occasion, that the British expeditions would not employ the photographic method at all. However, from the *Procès-verbaux* of the International Conference for the Transit of Venus, 1882, held in Paris in October last (recently published by the French Ministry of Public Instruction), this method of observing the transit was plainly in disrepute with the members of the Conference, and photography was not recommended, *although it was recognized that it might prove useful at certain stations.* If by "photography" was meant the form of its application in the British observations of the transit of 1874, we should unhesitatingly commit ourselves to this same conclusion, which, nevertheless, could not have been reached by any but a conference which closed its eyes to the results obtained from the employment of the photographic method which is distinctively American. All this is very easy to understand, however, on the simple statement of the fact that the United States had no representative in this conference.

—At its second session, the President, M. Dumas, announced that the French Government intended to occupy stations in Florida, Cuba, Martinique, and Mexico, and four others in South America; Dr. Foerster, of Berlin, stated that Germany would occupy two posts in the Southern United States, one in the Argentine Republic, and one at the Falkland Islands; the Danish Government and that of the Netherlands would each equip a single party; Spain intended to organize two stations, one at Porto Rico and the other in Southern Cuba; the Austro-Hungarian Government would send an expedition to South America; observations would be made at Coimbra and Lisbon, and perhaps also in one of the Portuguese colonies; and, finally, Mr. Stone, of Oxford, the Chief of the British Transit of Venus Commission, made a report of the stations proposed by the English Government, sixteen in number, the principal centres being the Cape with three stations, Australia with the Observatories of Sydney and Melbourne, New Zealand, and the Antilles. Expeditions were also proposed for the Bermudas, Madagascar, and possibly the Falkland Islands. The most important outcome of the Conference, however, is probably that suggested by M. Hirsch, of Neuchâtel—viz., the advisability of creating an international *bureau des calculs*, to discuss not only all the observations of the coming transit, but those of the transit of 1874 as well. The Conference finally expressed the wish that the French Government would consent to communicate, through diplomatic channels, with such other governments as were represented in the Conference, or who might be interested in the transits of Venus, in order to submit to them the proposition for convoking an International Conference on the Transits of Venus, after the return of the 1882 expedition, that an understanding might be established as to the means to be adopted to obtain the best and promptest use of the observations of the transits of 1874 and 1882, and in particular to inquire if it would not be well to create a temporary international bureau for that purpose.

—Madame Patti, "the Paganini of vocal virtuosity," as a Russian critic has justly called her, was never heard to such advantage in this city as on Thursday, when she appeared at the Germania Theatre as *Rosina* in the "Barber of Seville." The history of music records many operas which were composed with especial reference to the gifts and peculiarities of some distinguished prima donna. Rossini's popular comic opera was not written for Adelina Patti, but all its vocal and dramatic traits are so admirably adapted to her style and manner that no one would be surprised if he were told that she sat as a model before the Italian master while he sketched his score. It was difficult to decide what most to admire in her *Rosina*, whether her gay, mischievous, coquettish conduct in general, or the occasional expression of pouting impatience at the impertinence of her guardian. For once she disdained to distract attention from her features and her singing by the constant change and display of elegant and expensive toilets and jewelry. In the simple girlish attire of *Rosina* she looked again as she must have looked in the prime of her youth and beauty; and as she lightly tripped across the stage, warbling with all the ease and freedom of a canary bird, the most austere critic must have forgotten for the moment the æsthetic objections that can be urged against her art-career. It is all nonsense to talk about the lost beauties of Patti's voice. We did not hear her ten years ago, but we cannot believe that her voice was more perfect than it is to-day. Of course no singer's voice at forty is the same as it was at twenty; but in Patti's case the probable loss of some of the sparkle of the higher notes is more than compensated by the sonority and richness of the lower notes. Her registers are so beautifully equalized that a superficial observer may easily be led to assume that their clang-tint is identical and invariable. More careful attention, however, shows—what the use of a Helmholtz resonator would doubtless prove with scientific exactness—that whereas her matchless high staccato notes have the soft and simple tone-quality of a flute, her middle and lower notes are characterized by the presence of those overtones which give to the tones of an old Italian violin and viola that peculiar richness we all admire so much, because every single note here is a full chord in itself. In the "Ombra Leggiera" from "Dinorah," which she introduced in the music lesson, the perfection of her vocalization was most fully displayed, and her "efforts" (which apparently were no efforts at all) were rewarded by a double encore, and by applause which was as demonstrative as it was genuine. The support, as far as chorus and orchestra went, was much better than on Monday night, and reflects credit on the conductor, Signor D'Auria. The acting by the assisting vocalists was tame and seldom funny.

—Three orchestral and three vocal numbers were on the programme of the Symphony Society's fifth concert—the Introduction and Finale from Wagner's "Tristan and Isolde," Goldmark's "Sakuntala" overture, and Beethoven's Third Symphony; the air "Furibundo spira il vento," from Handel's "Partenope," and two songs by Schumann—"Ich grolle nicht" and "The ring upon my finger." Although the Introduction to "Tristan and Isolde" is, of course, in-

tended to be played at the opening of the drama, there is yet a disadvantage in having it at the head of a concert programme, because the musicians have not yet "warmed up" to their task sufficiently to infuse into the wondrous bars of this composition the volcanic fire and passion demanded by them. With the regular orchestra at a German opera-house the case is different, as the musicians play together every evening, and therefore remain warm all the time; although even in their case it is to be noted that the last act of an opera is almost invariably played with more vigor and spirit than the first. To this fact in part may be attributed the comparatively unsatisfactory interpretation of this sublime composition, and the equally grand finale, on Saturday evening. Contrary to the usual custom, it was better done at the rehearsal on Thursday afternoon than at the concert. The finale was taken a trifle too slow, the rhythmic *nuances* were not all observed, the grand climax was imperfectly led up to, the melody was not always sufficiently accentuated and dwelt upon, and there were even some positive omissions and wrong notes that did not improve the general effect. The reception of this number was, therefore, naturally not so enthusiastic as it always is at Vienna, for instance, where it gives rise to scenes of wild excitement when played by the Philharmonic Society, under Hans Richter's direction. The Beethoven symphony was interpreted in a more artistic manner, as was also the "Sakuntala" overture, a piece which is much more effective to-day than it will be ten years hence. Goldmark might be called one of the popularizers of modern music. Without possessing any marked originality, he cleverly assimilates the latest harmonic, melodic, and instrumental inventions of greater minds, and presents them anew in an easily intelligible form. To a certain extent, therefore, his works may be compared to magazine articles on Darwinism or on some other modern scientific principle; and they are particularly useful to people who lack time or opportunity to go to the original fountains of ideas. In the absence of an analytical programme, the word "Sakuntala" is little more than a distinguishing title for the composition, which is really a sort of symphonic poem. Few people are sufficiently familiar with the contents of Kalidasa's drama of "Sakuntala" to judge of the appropriateness of the music; and the overture can therefore be judged by them only from a purely musical point of view. Of the vocal selections the Schumann songs, together with an encore, were well sung by Miss Lena Little. But the old-fashioned Handel air was neither well sung nor is it in itself a piece of any musical value whatsoever. Handel's broadly melodious arias are as good to-day as they were in his own time, and cannot be heard too often; but his highly ornamented rococo arias seem as unæsthetic and unnatural to our ears as a full-blown crinoline or Queen Elizabeth ruff would to our eyes.

—The "Historische Gesellschaft" of Berlin, which has for several years published a thin quarterly entitled *Mittheilungen aus der historischen Literatur* (containing reviews of new books, many of them of great value), began, four years ago, the publication of an annual survey of historical literature, under the name of *Jahresberichte der Geschichtswissenschaft*. Two volumes (1878 and 1879) have already been published. The first volume was incomplete in some departments; the second volume is in sixty-eight chapters, grouped in the three divisions of Antiquity, Middle Ages, and Modern Times, each chapter under the charge of a specially qualified person—as, Jirecek for the Southern Slavs, and Wattenbach for Palæography. These editors are taken from all parts of Germany, sometimes even from other countries. The work is for the most part compendiously done, and we notice that this is especially the case with the United States; even a volume of over 800 pages does not allow a detailed discussion of all that has been accomplished in the field of history. In many cases, however, we have clear and valuable statements of the net results to historical science of the labors of the several authors. An index gives the title and page of every book noticed.

GARDINER'S CHARLES I.—I.

The Fall of the Monarchy of Charles I., 1637-1649. By Samuel Rawson Gardiner, LL.D. London: Longmans, Green & Co. 1882. 2 vols.

Of Mr. Gardiner's noble labors in the service of historical truth, and of the rich fruits which these labors have already borne, no one can speak or write except in terms of the profoundest respect and admiration. His spirit of laborious research, of perfect truthfulness, and of student-like seriousness is absolutely above praise. The results of his studies are already more than a sufficient reward for twenty years of earnest work. He has not, indeed, produced books which sell like a new novel, and which with the charms have many of the defects of romances. He has not startled the world with a single new paradox, or, what is much the same thing, perplexed the world with a single new fallacy. He has not wasted ingenuity in proving that Charles was the best and wisest of kings, nor has he attempted to establish in epigrammatic sentences that good histories must of necessity be dull, or that Mr. Cobden was as true an historian as Lord Macaulay. These and the like achievements he has left to littérateurs or professors, and instead of entertaining has instructed the world, by placing before every intelligent reader by far the best statement to be found in the English language of the ascertainable facts with regard to English history, from the day when James I. ascended the throne to the day when Charles I. hoisted his standard at Nottingham.

If such an account contains of necessity many more facts which are true than which are new, let no one suppose that it is wanting either in freshness or interest. Intelligent students can hardly study Mr. Gardiner's volumes without feeling that in some respects their views of the Stuart period undergo a change. The facts are set clearly before the reader's eyes. Different persons will, according to their different judgment or bias, draw different conclusions from these facts. Few, it is probable, will in all respects agree with Mr. Gardiner's own inferences; but every one will feel that from this author he receives what is a much better thing than any inference which an historian can draw—the facts on which a thoughtful man can form a judgment for himself. The one complaint which a person bent solely on the search after truth can make of his guide is, that Mr. Gardiner has, to a certain extent, confused the duties of a fair historian with the totally different duties of a charitable and sympathetic moralist, and has thus in his very passion for fairness shed a kind of moral haze over persons and events that ought to be looked at simply in the dry light of historical narrative. The complaint is, as far as it goes, a true one, and those who most cordially admire Mr. Gardiner's work, as also the spirit of his workmanship, may feel that because of their respect for his labors they can criticise, and ought to criticise, with freedom a fault which, if fault it is to be called, is but the exaggeration of a virtue, and flows from that passion for sympathetic analysis which is the peculiarity of our day. The aim of this article is to show by a few examples the nature of the fault which may be imputed to Mr. Gardiner, and the mode in which it affects his views of English history.

Mr. Gardiner brings out with extraordinary clearness a circumstance which, it may be suspected, many of his readers have never realized—viz., that Charles betrayed Strafford chiefly out of fear of the mob:

"All day long the street in front of Whitehall was blocked by a shouting multitude. Every minute it was expected that an attempt would be made to dash in the doors. The mob took up the cry that the Queen-mother was at the bottom of the mischief, and guards had to be despatched to St. James's to preserve her from attack. . . . It was nine in the evening before Charles, wearied out with long mental conflict, gave way at last. 'If my own person were only in danger,' he said, with tears in his eyes as he announced his resolution to the Council, 'I would gladly venture it to save Lord Strafford's life; but seeing my wife, children, and all my kingdom are concerned in it, I am forced to give way unto it.'"

"*Charles sinned against his conscience. Let him who has seen wife and child, and all that he holds dear, exposed to imminent peril, and has refused to save them by an act of baseness, cast the first stone at Charles.*"

It is the last words (not, of course, underlined by Mr. Gardiner) which exhibit in an exaggerated form his misconception of an historian's proper functions. Charles's course of action was thoroughly base. On this there is no question whatever. For Strafford's offences Charles was personally responsible. He had engaged to protect Strafford's life; he had undoubtedly the legal right to do so. Men in whom he could trust told him his duty:

"Juxon advised him to refuse his assent to the bill. Williams argued that the King had a public as well as a private conscience, and that he ought to submit his judgment to those who were learned in the law. . . . Charles still hesitated; his soul was wrung with agony. The Bishops were summoned a second time. This time Usher was amongst them, and Usher sided with Juxon. Williams persisted in the view which he had taken of the King's duty."

No person believes that Charles let Strafford die out of respect for law. Charles's own words, reported by Mr. Gardiner, strike away his last excuse. The King let a servant whom he believed to be innocent go with his assent to the scaffold, because he feared for the life of his wife and children. These are the admitted facts, stated with the utmost honesty by Mr. Gardiner. Then what is the meaning of Mr. Gardiner's reflection? The baseness of Charles's act nothing can palliate. Reference to the spirit of the age tells more against the King than for him. Whatever the faults of the seventeenth century, it was a time when persons of high position were trained to high physical courage, and Charles's whole theory of life rested on the personal power and personal responsibility of the Crown. Mr. Gardiner's moral reflection amounts to this—namely, that under Charles's temptations, if his character, training, and position be taken into account, we might any one of us have acted as basely as he did. Grant for a moment that this is so: the plea which is made for Charles may be made in favor of Catiline, of Borgia, of Robespierre, of Lefroy, of Guiteau—of any criminal, great or small, who has ever existed or ever will exist. Whether this kind of defence, which, if it avail any one, is available for every one, deserves the consideration of moralists, may be a question. That it is quite out of place in the mouth of an historian is obvious. Moral guilt—that is, the amount of blame which a man may deserve for his faults or his vices in the eye of Heaven, or in the judgment of his own conscience—is not a matter of which an historian can be the judge. What a narrator of past events is bound to do,

as far as it lies in his power, is to narrate these events with complete accuracy and truthfulness, to tell his audience what were the actions of the men of the past, and to trace as far as may be the motives from which these actions probably proceeded. In analyzing these motives he must often dwell on the difference between the sentiments of different ages, and therefore, no doubt, will indirectly in some cases lessen and in others increase the condemnation with which we regard the crimes of other times. But the narrator's duty is to narrate, not to judge. Once let him fancy that it is his function to estimate moral guilt, and it is more than probable that even his account of facts will suffer from an unconscious moral bias.

It is, for example, in the instance under consideration, somewhat difficult to feel sure that Mr. Gardiner has not overrated the imminence of the peril under which Charles's courage gave way. Until the outbreak of the Civil War he was always, unless it be on the very occasion when Strafford's life was sacrificed, personally free. His position was utterly different from that of Louis XVI. before the flight to Varennes. He conspired against the Parliament; he attempted to arrest the five members; he made open preparation for civil war. Yet neither the Parliament nor the London mob dared lay a hand upon him. His death was admittedly a shock to the vast majority of the English people. Is it easy to believe that in May, 1641, the Parliament or the city would have tolerated the murder of the King, his wife, or his children?

"Ruinous as his [Strafford's] success would have been, in his devotion to the rule of intelligence he stands strangely near to one side of the modern spirit. Alone amongst his generation, his voice was always raised for practical reforms. Pym and Hampden looked upon existing society as something admirable in itself, though needing to be quickened by a higher moral spirit and to be relieved from the hindrances thrown in its way by a defective organization. Strafford regarded that society as full of abuses, and sought, in the organization which was ready to his hand, the lever by which those abuses might be removed. In happier times Pym and Strafford need never have clashed together, save in the bloodless contests of Parliamentary debate."

Here, again, is seen Mr. Gardiner's leaning toward a mistaken standard of fairness. It is certainly true that in modern times Pym and Strafford could clash only in bloodless contests; for the strength of the state happily prohibits every political contest which is not bloodless. But the impression which Mr. Gardiner's words are, one must take it, meant to convey is, that Strafford and Pym differed only in seeing different sides of truth. This impression, though happily rendered innocuous by the perfect truthfulness of Mr. Gardiner's narrative, is, to judge from that narrative itself, utterly misleading. Strafford may have possessed great administrative powers. One may well take Mr. Gardiner's word for this, though he does not make the grounds of his belief in Strafford's great talents quite so clear as could have been wished. But of Strafford's zeal for the public good; of his possession of any grand ideas of government whatever; of his enthusiasm for the rule of intelligence, it is all but impossible to find the proof in Mr. Gardiner's pages. The statesman who, without Laud's religious fervor, supported Laud's narrow scheme of church government; who, being supposed to entertain great schemes, was entirely wanting in patience, and constantly gave way to violent passion; who, being credited with high public spirit, supported the debasement of the currency; and who staked the safety of the Crown upon an utterly mistaken view of English feeling, has, to say the least, a very doubtful claim to the merit, whatever it may be worth, of standing near to one side of the modern spirit.

The plain fact appears to be that if men's actions and policies are to be judged historically, Strafford was, on the great issues of his day, as distinctly in the wrong as Pym was distinctly in the right. But this plain fact is exactly the truth which Mr. Gardiner, on principle, refuses to admit. He cannot believe that at any great crisis of human history parties were divided by the definite line of right and wrong. Profoundly impressed with the truth that the problems raised by the great rebellion were problems of great intricacy; still more impressed by the knowledge that good men and wise men took opposite sides in the contest which rent English society asunder, he apparently comes to the conclusion (which is in itself very doubtful) that there was as much goodness and wisdom to be found among the supporters of Charles as among the supporters of the Commonwealth, and impliedly draws the further still more doubtful conclusion that the virtues of the leaders on each side were equal. This idea is connected with a singular kind of optimism. Mr. Gardiner appears unwilling to admit that the undoubted failure of the Puritan movement worked any permanent injury to England. He intimates, in more than one passage, that the bitter experience of the Civil War led the English people to the discovery of the true cures for the political and the religious difficulties which perplexed and divided the men of the seventeenth century. The institution of the Cabinet removed the practical objections to Parliamentary government. The maintenance of a state church, surrounded by societies of tolerated Dissenters, satisfied the religious sentiment of the majority of the people, and at the same time recognized the claim to individual freedom of belief. Admit that a cabinet and the policy embodied in the Toleration Act afforded the true and satisfactory answer to the questions which divided Strafford and Pym, and the consequence appears not unnaturally to follow that you may sympathize both with the statesman who supported the prerogative, and with the statesmen who struggled to establish the sovereignty of Parliament.

Unfortunately, the optimistic view of English history is, like most forms of optimism, but partially true. Cabinet government is not without its evils; the ecclesiastical system under which the national church ceased to be the church of the whole nation, and Dissenters, giving up the claim to religious and civil equality, had to put up with mere toleration, is scarcely a system which has, or ever had, any title to be more than a very unsatisfactory makeshift. A writer less inclined than Mr. Gardiner to hold that there is good in all things might plausibly maintain that the partial failure of the Puritan revolution, or, in other words, the partial success of the cause represented by Strafford and Laud, has been the source of evils to England which the lapse of centuries has not entirely removed. However this may be, the crimes of Strafford can hardly be palliated by the fact that he did not foresee a system of government which, could he have foreseen it, he would in all probability have detested as heartily as does Prince Bismarck. Nor can the cruelties of Laud be made to lose something of their brutality by the undoubtedly true reflection that the Archbishop could not anticipate the day in which the Church of England would be rich and powerful while Independents and Baptists worshipped peacefully in their own chapels, undisturbed by any fear of losing either their goods or their ears.

Mr. Gardiner's conception of the kind of impartiality which ought to be displayed by a fair-minded historian, and also his tendency toward optimism, are each to a certain extent defects which occasionally give a false tone or color to his judgment of men and of policies. But these defects are, after all, but slight faults. They are the result of an almost inevitable reaction against the over-confident dogmatism which has too often been the predominant trait of English historians. Mr. Gardiner commenced his labors some twenty-two years ago. "Macaulay and Forster were then in possession of the field. The worship of the Puritans was in the ascendant, and to suggest that it was possible to make out a reasonable case for Bacon and Strafford was regarded as eccentric. All this is changed now. Few are to be found to say a good word for Puritanism, and the mistakes of the Long Parliament are unveiled with an unsparing hand." "I have striven," he adds, "with what success I know not, to take a broader view of the deeds of the great men who made this England in which we live, and to realize and measure the greatness of Pym as I formerly attempted to realize and measure the greatness of Strafford." The attempt has been assuredly crowned with deserved success, and critics who think that even sympathetic advocacy has its weakness will recognize that Mr. Gardiner's treatment of a critical era has been such as to throw upon it a flood of new light.

MYRON HOLLEY.

Myron Holley; and What He Did for Liberty and True Religion. [By Elizur Wright.] Boston: Printed for the Author. P. O. Box 109. 1882. 12mo, pp. 328.

"THE greatest of the three college-bred sons" of Luther Holley, of Salisbury, Conn., has hitherto eluded the drag-net of our biographical dictionary-makers. His two brothers and his present biographer (likewise a native of Litchfield County) already have a place in one or other of our American books of reference, and doubtless the eulogium before us will eventually cause the name of Myron Holley to be added to the printed roll of American worthies. Briefly, what Mr. Wright contends for is, that Holley, without originating the idea of the Erie Canal, was the most efficient and indefatigable promoter of its construction, under circumstances at once highly honorable and highly disastrous to himself; that he was the virtual founder of the Liberty party; that the State of New York owes his heirs the compensation which it denied to him; and that his character and public services entitle him to grateful remembrance by his countrymen.

In what Myron Holley "did for liberty" Mr. Wright would have us reckon the Canal itself. While the South, the Missouri Compromise gained, had large visions of Northern commerce bowing the knee to King Cotton, and Charleston rivalling the greatness of London and Rome—

"while the ingenious Southern statesmen were dreaming these dreams, Myron Holley was patiently and enthusiastically digging that ditch through the marshes and swamps of New York, which in 1825 was to let the enterprising, well-schooled white free laborers into the vast forests of Ohio, Indiana, and Michigan, and into the boundless prairies of Illinois and Wisconsin. These became rich States, while, as to the mass of the white population, all the South became poor. More and more the great trading metropolis of the East, New York, derived its wealth rather from this new West than from the South. By ten years after the Missouri Compromise, so cunningly contrived by Henry Clay, the North and New West were ripe for a moral movement to emancipate public sentiment from its servility to the slaveholders" (p. 228).

Mr. Wright gives a graphic picture of the Western wilderness to which the Canal furnished easy access, and quotes largely and discursively from De Witt Clinton's entertaining journal of the exploration of 1810 made by himself, Holley, and the other commissioners of that date along

the projected line of the Canal. The next episode in Mr. Holley's career was his earnest espousal of anti-masonry, consequent upon the disappearance of Morgan and the intense excitement produced by it in Central New York, where Mr. Holley's home then was. The last was his participation in the anti-slavery movement, in the winter of 1837-38, which we may assume to have been decided by the recent murder of Lovejoy, though Mr. Wright (pp. 239-243) connects it with Mr. Clay's presentation of the gag-law petition in February of the former year; his engagement as an anti-slavery lecturer; and finally, his proposal at a State Anti-Slavery Convention in Cleveland, in 1839, "to make an immediate nomination of President and Vice-President." Defeated here by his fellow-abolitionists, he succeeded later in a convention at Warsaw, N. Y., where "was made the first Presidential nomination for the celebrated 'Log Cabin and Hard Cider Campaign' of 1840," and James G. Birney's name was presented to the country for that office. This nomination was confirmed April 1, 1840, at Albany, by a Convention of which Holley was the master spirit—the head of the committee on business and resolutions, of which Mr. Wright himself was a member.

At this point the biography touches upon debatable ground in the history of the anti-slavery movement, and becomes a valuable, if one-sided, contribution to that history. We cannot go into the details of the great division of the abolitionists in 1840 into Old and New Organization. Mr. Wright candidly confesses that one of the motives of the secession—the prejudice against women as equal colaborers in the reform—was narrow and illiberal; but he leaves it to be inferred that time has justified the political motive. This, however, will, on impartial examination, prove not so clear as that an anti-slavery party was the inevitable product of the non-resistant, non-voting agitation steadfastly adhered to from 1830 to 1840 and *usque ad finem*. It is only fair to say that Mr. Wright's remarks on this score are not conspicuously in self-defence, and not at all in self-glorification where some of the praise which he accords to Holley should rightfully be also his own.

The private life of his hero is charmingly depicted with the aid of private letters not numerous nor intrinsically remarkable, yet well calculated to inspire respect and affection for the writer of them. What we gather from these and are told about his love of wife and children, his fondness for gardening and tree-planting, his simple goodness and absolute integrity, harmonizes well with the lineaments of his handsome face as perpetuated in the portrait which adorns this book. What is most extraordinary, therefore, is the fact, stated on the reverse of the title-page, that "three leading publishers, though guaranteed against loss, have declined to publish this book, either with or without the author's name." Mr. Wright's positive and incisive style, in which long practice as a journalist has made him a master (though he was never a 'prentice hand), is capable, certainly, of giving offence to more than one class of readers. For example, he says of Holley's abandoning the law: "He had an instinctive aversion to all crookedness. Whether he held that this disqualified him for a profession in which nothing is more indispensable to pecuniary success than a faculty of suppressing the truth and making the worse appear the better side, I find no record." But one could as soon conceive of a publisher's taking alarm at this sentence as the editor of "Harper's Drawer" rejecting a similar skit on the legal profession. Readers not ignorant of our inferior intellectual toleration in matters theological as compared with the mother-country, in spite of its state church, will speedily conclude where the shoe pinched. What Myron Holley did for "true religion," as defined by his biographer, was undoubtedly the bugbear of the "three leading publishers"; and Mr. Wright's long public career and eminent and versatile services availed nothing against his heresy and that imputed to Mr. Holley. The latter was in truth a sober and reverent "Bible Christian," and what he did for religion thousands of heads of families have done as unostentatiously as he. He was opposed to "revivals" as, "on the whole, not promotive of religion or virtue," while very favorable to hypocrisy; and he severely and justly rebuked a schoolmistress who gave up the entire forenoon to a couple of male revivalists to work on the ignorance and fears of her pupils, his daughter being among the number. For the rest, bigotry would find it hard indeed to stigmatize him. Mr. Wright, in the pursuit of true religion, has gone an arrow's flight beyond; but as he is an American citizen of unblemished reputation, it should be a matter of general interest to discover what religious sentiments "leading publishers" are afraid to give currency to, even when guaranteed against immediate loss—in other words, what is the nature and extent of the censorship that tends to suppress a work designed to celebrate an undoubtedly noble and pure life, of great and lasting influence upon the destinies of the country. To this end, even more than because the proceeds of this publication, if any, are to go to Mr. Holley's heirs, we cheerfully comply with the author's request that we announce his readiness to send the book to any address on application as above, on receipt of one dollar and fifty cents, or of ten dollars for as many copies.

Catalogue of the Library of the Boston Athenæum. [By Charles A. Cutter.] 1807-1871. Parts 1-4. Boston. 1874 [1872]-1882. Pp. 3404. 8vo.

THE history of the Athenæum Catalogue, as briefly sketched by Mr. Cutter in the appendix, is a history of the science of bibliography during its progress. The original intention of the trustees, twenty-five years ago, was to print a simple list of authors and titles. But under the influence of the newly-awakened interest in libraries which began to be felt at that time, the plan broadened and extended until now the finished work marks the highest point yet reached in the art of cataloguing. This gradual development of the conception of what the catalogue of a general library should be, involved, of course, radical changes in its construction, which have not only added greatly to the labor of preparation, but have also caused certain imperfections that would have been avoided had the work been begun and finished on the same general system. There are, speaking generally, three kinds of catalogues: the simple list of authors or titles; the classified catalogue, in which the books are put under their various subjects, as Theology, History, Travels, etc., and the dictionary catalogue. Mr. Cutter has adopted this last form, in which the names of authors, the titles of books, and the subjects are all arranged in one alphabet. This is obviously the simplest method, and combines most of the advantages of the classified catalogue. It has never before been carried to such an extent in a printed catalogue. The contents of the various collected works—the publications of learned societies, public documents, etc.—are not only given in full, but are also carefully analyzed, and placed under both author and subject. The writings of the leading essayists, and the important articles in some of the prominent serials, are treated in the same manner. Scattered throughout the volumes are many explanatory and bibliographical notes, drawn from every source open to the bibliographer. The classification of books under their subjects and the subdivision of these subjects have been by no means the lightest or the least valuable part of Mr. Cutter's labors. Theology, for instance, fills more than twelve pages, and is divided into eight heads, while the titles on the United States fill 108 pages under 141 heads. Great pains have also been taken in the endeavor to discover the names of the authors of anonymous and pseudonymous works. The typographical execution of the catalogue is most praiseworthy, especially in the excellent selection of different kinds of type to discriminate between the various classes of entries. Great success has also been attained by similar means in making the contents of long serials, etc., easily intelligible. Of the general accuracy of the catalogue it is difficult to speak too highly. There are errors, of course. In a work of this magnitude, containing a quarter of a million separate entries, this is inevitable. But, after a careful examination, we have not found a single blunder such as disfigures many excellent catalogues, and few errors which are not obviously mistakes of the copyist or printer.

While thus testifying to the general excellence of Mr. Cutter's work, on which he has expended an amount of labor, of patient investigation, of careful thought, which will never be known except to himself, and will be appreciated at its true value by but few, there are some points on which we shall venture to take exception to his methods. We do so with less hesitation because the Athenæum Catalogue will naturally be taken as the standard to which, for years at least, other cataloguers will look for guidance in their work. Our principal criticism is that it is a mistake to give bibliographical details in cross-references. It adds largely to the expense and increases the bulk of the catalogue—a very serious matter merely as regards convenience of consultation—without corresponding advantages. To take an illustration selected at haphazard, Froissart's 'Chronicles' are entered in full under *France* and *Great Britain* as well as under *Froissart*. Here, in the course of 200 pages in the same volume, twenty lines are taken up with purely bibliographical matter twice repeated, when a single line in each case would have called the attention of the student of French or English history to the 'Chronicles.' For the information about the various editions he need but turn a few pages to the original entry. "Charles F. Adams' Platform," a political pamphlet, is entered in full three times in the same volume under *Adams, Charles*, and *Buffalo*, and also, under *United States*. A minor objection is that the scientific classification of books under their subjects is at times too rigidly adhered to. The necessity for a minute and careful classification is obvious, but the cardinal rule to be observed in a catalogue for general use is, after all, simplicity. To make clear our meaning, Prescott's 'Conquest of Mexico' is not to be found under *Mexico*, but under *Cortez*, to which title the inquirer is referred from *Mexico*. Occasionally there is a marked inconsistency in this respect, as, for instance, this same author's 'Ferdinand and Isabella' is to be found under *Ferdinand*, but not under *Spain*, while his 'Reign of Philip II.' is to be found under both *Philip* and *Spain*. Then, again, we must strongly object to giving foreign names in any other form than that by which they are generally known to English readers, as Raphael, not "Raffaello"; Michael Angelo, not "Buonarotti"; Livy, not "Livius." It is at least questionable, too, whether the works of George Eliot should be put under a name, Lewes, which was never legally hers, and by which not one reader in ten thousand would know her, or those of

George Sand under Dudevant. Mr. Cutter has placed the titles under subjects chronologically, not alphabetically. There are some advantages in this method: it gives an interesting bird's-eye view, as it were, of the progress of knowledge on that subject, and enables one to detect instantly the latest work upon it. But the difficulty of finding a given title among a large number of similar ones is often great, and the departure from the alphabetical arrangement which prevails elsewhere is, on the whole, confusing to the user of the catalogue.

Of the necessity of devising some universal catalogue, or at least some system of coöperative cataloguing, we are more than ever convinced after seeing the large and costly work which the proprietors of the Boston Athenæum have published. There can really be no absolute need that a large part of the revenues of every considerable library should be spent on a separate catalogue when the books are mainly the same in each. This at least is certain: the contents of the various great collected works, serial and society publications, which are given here, need not be repeated in the printed catalogue of any library which possesses these volumes, as a reference to the Athenæum Catalogue will be sufficient. We are not then without hope that, with the rapid increase of bibliographical helps to students, a simple and inexpensive method of cataloguing an ordinary miscellaneous library will be discovered. It may take the form of a list of standard works on every subject, with ample references to all the trustworthy sources of knowledge. This would probably index the larger and most used part of the contents of every public library, while the simple addition of shelf-marks would make it ready for use. Such a list, a revised edition being published annually, would not only greatly diminish the running expenses of our libraries, but would of course prove of great assistance to all students.

Events and Epochs in Religious History. By James Freeman Clarke, author of 'Ten Great Religions,' etc., etc. Boston: James R. Osgood & Co. 1881.

THE title of this book prepares us for the inconsequent and varied character of its contents. It is made up from a course of lectures given by the author in the Lowell Institute, Boston, in January, 1880, and there is nothing in the character of the lectures to prevent the supposition that they were all composed within the month, and that much of the information in them was collected at the same time, and that still the author, who is the diligent preacher and pastor of a Boston church, had time enough remaining for his sermon writing and parochial cares. But what is much more likely is, that the different lectures were prepared without any reference to each other along the course of many years, and that the opportunity to deliver a series of lectures before the Lowell Institute first suggested their juxtaposition. They are of unequal value, yet must all of them have been interesting and instructive to the people who heard them delivered, and will prove so to many others in their present form. A certain scrappiness is common to them all. They have not the flow and continuity which mark the previous books of the same author. The effect of scrappiness is heightened by the inclusion in some of the lectures of two or three different subjects, any one of which would be ample for an hour's discourse. In one lecture Augustine, Anselm, and Bernard are treated together; in another, with more evident excuse, Luther and Loyola.

Some of the lectures have resulted from much wider study than others, and more profound deliberation. The two lectures on the Catacombs belong in the first rank. At the close of these, certain inferences are drawn from the catacomb inscriptions which do not seem unfair. They are that the Christianity of the catacombs was much more ethical and social, much less theological and ecclesiastical, than that of later times; that the primacy of Peter and the worship of Mary formed no part of the Christianity of the early Empire. Dr. Clarke is nothing if not liberal, and on page 31 he puts in a tender plea, that may possibly be shocking to some of his Protestant friends, for the Roman Catholic custom of praying for the dead. The logic of the situation seems to be entirely on his side. Lecture iii., upon "The Buddhist Monks in Central Asia," is not a little suggestive of the famous treatise upon "Snakes in Ireland." Something about Buddhist monks is quoted from the well-known description of Father Huc, but the lecture is for the most part concerned with other things, the leavings, as it were, of the author's lecture on Buddhism in his 'Ten Great Religions.' The lecture on Monasticism must be regarded as extremely superficial. No justice is done to the philosophical and social inspirations of the early monachism, nor is any allowance made for New Testament warrant which some of the wisest—Origen for example—found, or thought they found, for extreme asceticism. Thoreau is introduced as the last of the monks, and Emerson as the last of the mystics, in another lecture in which the delicacy and subtilty of the subject are in striking contrast with the treatment it receives. The lecture upon Savonarola does not impress us as having gone so near to the heart of the matter as George Eliot in 'Romola.' "In a divided age he was a whole man," is Dr. Clarke's concluding sentence. In the fact that he was not a whole man—that, ethically grand, he was intellectually superstitious and fanatical—a better judgment finds the tragedy of his inner life.

Dr. Clarke is very fond of contrasts and comparisons, and he is often happy in the way of these, but not always. Surely nothing could be worse than this, on page 135 (he is speaking of Augustine): "We ask whether the sons of Africa can ever be elevated to our level, and behold, an African intellect is the ruler, almost to our time, of Christendom!" Hundreds of persons who heard the lecture are probably laboring to this day under the misconception, a natural inference from our quotation, that St. Augustine was a full-blooded negro. Of minor blemishes, the misspelling of Lucretia Mott's name is one of the most unaccountable. In Emerson's famous quatrain from the "Voluntaries," quoted page 117, "boy" is no improvement upon youth in the last line. When every abatement has been made, the book is overflowing with its author's geniality and his sympathetic spirit. Its value is not a little increased by twenty plates, eighteen of which are heliotypes. Here is a method of illustration that is inexpensive, and might be utilized much more frequently than it is, greatly to the reader's advantage. The woodcuts in the article on Monasticism are better calculated to make an impression on the memory and imagination than many pages of fine writing about the magnificence of the abbeys of Brussels and Clairvaux. Two heliotypes are given of Savonarola, one of which is badly reproduced upon the cover. There is nothing in either of these suggestive of George Eliot's face, but plenty in another, for which one of these might fitly have been spared.

Eugene Onéguine: a Romance of Russian Life in Verse. By Alexander Pushkin. Translated from the Russian by Lieut.-Col. Spalding. London and New York: Macmillan & Co.

COLONEL SPALDING'S translation is probably one of the fruits of the general reawakening of interest in Pushkin in his own country. Twenty months ago a memorial of him was erected in Moscow, and its completion was made the occasion of very widespread and heartfelt eulogy of him. At St. Petersburg, Turgeneff made a most felicitous and pathetic address. 'Eugene Oneghin' is by no means the best introduction to Pushkin's works. The fragments Sir John Bowring translated years ago have far more of fire, and such a poem as 'The Gypsy' far more of picturesque effect. As to the merit of the translation, it seems to us another example in support of the argument in favor of abandoning the attempt to render verse in verse. Were it not better to seek to preserve the poetic spirit rather than to sacrifice it to the attempt to express it in an alien form? Poetry in the sense of *Dichtung* is the common possession of all languages, and as such is independent of verse.

The original is exaggerated frequently, too often with the effect of degrading it. Narrow space prevents many illustrations, but any page will afford one. Monsieur l'Abbé, "a Frenchman poor," is made "a starving Gaul." "In the depths where with you I swim, dear friends," becomes

> "In that morass where you and I
> Wallow, my friends, in company."

This is the more surprising as the noun translated "morass" (*omut*) is so literally "a depth" that it is the word of the proverb, "V' tikhoy vodye omuti glubokie," which is our "Still waters run deep."

A more serious liberty with the original is the attempt to make a continuous whole out of what the author himself considered but a fragment. In the Russian, whole stanzas are wanting, their places being indicated by numbers. Among Pushkin's papers were found many stanzas which had once belonged to it. Eighteen are continuous, and would have made part of another canto, "The Pilgrimage of Oneghin." Pushkin seemed to regard Oneghin as a friend and confidant, and to have entrusted to him everything without reserve, always intending to make over the work into a perfect whole—a purpose not abandoned even when the last part was printed in 1832, seven years after its commencement. To present such a fragment as a whole is in itself an injustice.

The *parti pris* of the translator is evidently the explanation of the tone of the work. His view is that Pushkin imitated Byron—Oneghin is Don Juan; hence copy, if possible, the spirit and language of that poem. This is really to premise that Pushkin imitated Byron's faults, and only his faults. To say that he did not imitate Byron would be to deny his own words. The first outcome of all literary activity in Russia in the first quarter of the century was to follow foreign models. It was the inevitable result of the first close contact with the western world. There is a sketch by Pushkin of the same date as the conclusion of this poem, for a novel to be called 'The Russian Pelham.' It is far more like Bulwer's work than 'Oneghin' is like 'Don Juan.' The mistake is not in saying he was an imitator; it is in supposing that he was nothing else. To prove his independence of Byron intellectually and morally, one need take only this poem.

The story in brief is this: Oneghin, weary, world-worn, seeks relief from ennui in the retirement of the country with his friend, the young poet Lenski, by whom he is introduced to

his betrothed and her sister Tatiana. With selfish disregard of consequences, he wins the love of the latter. In innocence and confidence she confesses it to him unsought. To her mortification and grief, he listens coldly, then insists with biting scorn upon the ills of marriage and his own repugnance to it. Months after, Oneghin reappears with his friend at Tatiana's birthday fête. Perhaps goaded by conscience to some excess, he wantonly picks a quarrel with Lenski, kills him next day in a duel, and leaves the country. Olga recovers first from the blow, and marries another suitor. Tatiana is heart-stricken, and would have died but for the intervention of friends who take her to the gay world of Moscow. It "met her smilingly," and in time she marries a general and a prince.

Oneghin returns to Moscow and finds the little country-girl in the first splendor of success as the *grande dame* of society. She scarcely notices him. He falls blindly, madly in love. His repeated letters receive no answer, and at last, in despair, he resolves to force an interview with her. Chance favors him, and he enters her boudoir unannounced. He finds her in tears. He throws himself at her feet. It is now her turn to listen, but there is no triumph in the revenge which time has thus wrought for her. She silences him imperatively, even while in deepest sorrow; she admits that she loves him now, as she has always done, and must always do. Yet with unshaken firmness she insists: "But to another I am given, to whom I shall be true for ever." She leaves the room, and there the poem ends. Much as there is in common in the character of the two heroes, surely this is not the story of Don Juan.

The book can have but a curious interest for us, who are so far from the life it describes; but in Russia it is the best-known and oftenest-quoted of Pushkin's longer works. Its descriptions of city and country are current coin in literature; and the initiated read between the lines much of the social history of the dark days in the beginning of Nicholas's reign. As regards the place which Pushkin himself should hold in a final judgment, it is difficult for foreigners to understand the enthusiasm of his countrymen, until one realizes that it was he who first woke them to a sense of their language as a poetic language; that he is, as Turgeneff calls him, "not only the poet of the people, but the national poet." He came before the light, and he came by himself. After fifty years the Russians still listen to him as to a voice singing alone in the darkness.

Kantian Ethics and the Ethics of Evolution. By I. Gould Schurman, Professor of Logic and Metaphysics in Arcadia College. London: Williams & Norgate; New York: Scribner, Welford & Co. 1881. Pp. 103.

THE author, manifestly a young man just home from foreign study, after declaring Professor Zeller, of Berlin, "the foremost thinker of modern Europe," and Mill and Hamilton to have mainly an historical interest for our generation, attempts to show the defects of the Kantian, and still more of the Spencerian, ethics, and proposes partly as a union of, but more in place of both, the rightly-developed Aristotelian principle of the "idea of man as such." By his theories of spontaneity in the understanding, and especially of autonomy in the pure will, Kant neglected the empirical element. His categorical imperative requires us to act, or to realize thought, but gives us nothing to realize; and its universality is so abstract that anything might become a moral law. By ignoring the pleasurable as impure, his principle becomes formal, empty, and essentially subjective. The true principle of "man as such" is not Comte's *grand être*, but is family, state, church, society, or Schleiermacher's "ethical goods," so that the individual has not to create a morality from within, but to make his own the concrete morality of his country embodied in these institutions. This is essentially the principle which Trendelenburg used to express in his lectures; and a famous Hegelian sentence of his is quoted, that "no other task can be given to man than the realization of the idea of his own worth, and that no other than this can be comprehended, no other recognized, by him." And again: "An ethical philosophy which would exclude pleasure would be contrary to nature, and one that would make a principle of it would be contrary to spirit."

This is all clearly, and we believe truly, said. The radical defect of Kant's ethics is delineated in a reverent way, which, in point of spirit, and often even of manner, is a model of philosophical criticism, and which goes far to disarm the prejudices with which one takes up most of the many digests, popularizations, and expositions of the now much-digested and exposed German idealists. Hence we regret all the more that the writer has fallen into the popular dogmatic tone in discussing the 'Data of Ethics.' We have no predilection for Spencer, but it is high time to protest against the "utterly utter" method of treating him which convicts him of every species of absurdity by some rapid and indiscernible legerdemain, as in the Arabian tale in which the adversary was cut through and through by a blade of such infinite thinness that, if challenged to shake himself, he would fall apart in slices. Our author compares Spencer's system to an "acoustics of color"; finds in it a "naïveté that is really surprising"; tells his readers that it "empties morality of all its content," and "suppresses all that is most characteristic in morality." It does not even "explain development nor heredity." Nervous modifications, we are told, "cannot, properly speaking, be accumulated or transmitted," and "in the light of reason the whole process reveals itself as illusory." Fundamental positions are "obviously" wrong, and only "slight surveys" reveal their shallowness. In short, instead of being a serious and laborious attempt to explain moral and psychic facts, which commends itself to many very respectable thinkers, the only inference from these pages is that it is a tissue of errors and absurdities. Now philosophy will never get beyond individualism and provincialism—Hegel's animal kingdom of mind—till each thinker confines himself to a field so narrow that he can make himself an authority in it, and learn respect for those who labor in other departments. The mind is larger than all the sciences together, and its students should learn solidarity, and remember, as the old German proverb tells us, that beyond the mountains that limit their horizon there are people.

Scotland in Early Christian Times. (Second Series.) The Rhind Lectures in Archæology for 1880. By Joseph Anderson, Keeper of the National Museum of the Antiquaries of Scotland. Edinburgh: David Douglas. 1881.

IN the present volume the subject of the author's Rhind Lectures for 1879 is continued, and his main thesis further developed with illustrations from a wider field. In the ecclesiastical remains of Scotland in her early Christian times—the illuminated MSS., bell shrines, crosiers, and reliquaries which he then examined with great scientific acumen and research—he found relics of a culture which exhibited a feeling for decorative art, a faculty of design, and a skill in the technical processes of art-workmanship sufficient to excite admiration at the present day. The stream of culture must, however, have steadily increased. Somehow—and it would be interesting to know how, since artistic progress means also progress along other lines—between the seventh century, the period of the best illuminated MSS., and the tenth or twelfth century, a transition occurred. The art, previously circumscribed by ecclesiastical limits, became more secular, and its sphere was correspondingly enlarged. It is this development from an ecclesiastical to a national school of art, from the illumination of MSS. to the most exquisite art products in jewelry and sculpture, that forms the subject of the present series of lectures.

The first lecture treats of the remains of decorative metal-work in gold, silver, and bronze in the shape of brooches, etc., which, amidst their variety, possess a typical form and all the essential characteristics of the art of the MSS. The other lectures are devoted to the remains of decorative stone-work—the monuments, their art, their symbolism, and their inscriptions in Celtic and Oghams, and in Runes and Roman letters, respectively. From these it is clear that the sculpture of the period also has an individuality of its own. Even the symbolism of the monuments is unique. It has much in common with the symbolism which occurs on all early Christian monuments, but it has also a local and conventional character, and the meaning of many of its symbols is at present veiled in mystery. Moreover, in general design as in minute details, the decorations of the monuments "are similar in style of treatment and manner of composition to the illuminated pages of the Celtic MSS." And there is ample evidence that the art brought to such perfection by the scribes passed in the eleventh and twelfth centuries to both jewelry and sculpture.

This school of decorative art in Celtic Scotland was singularly original. Its characteristic features—its interlacing, fretwork, and spiral ornamentation—are found over a wider area; but they were never developed into "a systematic style of art" elsewhere, nor do they give a distinctive character to any other than Celtic art. This art attained a high perfection. "No other monuments," says Mr. Anderson, "are characterized by such a lavish profusion of adornment." And he adds, again with a pardonable enthusiasm, but in too sweeping terms:

"A legacy of art like this of the monuments—although its scattered materials lie here and there in fields, in hedges and ditches, by lonely roadsides, or in nettle-grown corners of country churchyards—is really a school which has many and varied capabilities of public utility, and is therefore a possession of which any nation might well be proud. It constitutes a wealth of material which no other nation possesses, or can ever hope to possess. Three hundred examples of an art like this represent a collection of art-materials such as has not fallen to the lot of any other nation of northern Europe. They are materials of such intrinsic value and suggestiveness that our designers, sculptors, and jewellers are willing to borrow inspiration from them. I believe that I am correct in saying that no variety of ancient art-workmanship is more generally imitated at the present day, and that the closer the copy the better the work. The formation of such a gallery of art-materials in the country to which they are indigenous would not only restore to the native genius of the Scots the original elements of that system of design which are its own special inheritance, but it would also be an epoch in the history of art itself."

Artistic as well as literary forms are a permanent expression of a nation's life; and these Celtic remains are valuable from an archæological and historical as well as artistic point of view. Mr. Anderson has summarized many interesting details brought to light in the study of them (p. 122).

Glossary of Technical Terms, Phrases, and Maxims of the Common Law. By Frederic Jesup Stimson. Boston: Little, Brown and Co. 1881.

THIS Glossary is said to be the result of an attempt to produce "a concise Law Dictionary, giving in common English an explanation of words and phrases, English as well as Saxon, Latin, or French, which are of common technical use in the law." It will be found a convenient hand-book. The chief criticism to which it seems to be open is that in the selection of catchwords too great importance has been given to initial prepositions. For instance, under the word *de* we find several pages of phrases beginning with *de admensuratione dotis* and ending with *de warrantia diei*, containing several dozen in all; but in none of them is the preposition the important word, or necessarily the word which remains in the memory, and therefore it would have been better to arrange them under the real catchword, with cross references to the prepositions, or *vice versa*. The volume seems to contain almost all the Latin phrases in ordinary use. The value of a familiarity with these at the present day is differently estimated by lawyers. Those who have a classical education will always be apt to think that legal propositions cannot be intelligently grasped by persons to whom Latin is an unknown tongue. On the other hand, there have been at least one or two great lawyers whose unfamiliarity with it was a by-word. Lord Kenyon used Latin entirely at random, the classical phrases with which he was in the habit of closing his finest periods having absolutely no relation to the sense of their contents, as in the case of his celebrated charge to the jury: "Having thus discharged your consciences, gentlemen, you may retire to your homes in peace, with the delightful consciousness of having performed your duties well, and may lay your heads upon your pillows and say, '*Aut Cæsar aut nullus*'"; and his delightful translation of the phrase, "as plain as the nose on your face," by "*latet anguis in herba.*" There is said to be in existence, though out of print, a collection of Latin law maxims by an old practitioner, in which the maxim *Catella realis non potest legari* appears in English as "A genuine little whelp cannot be left in a legacy"; *Messis sequitur sementem*, as "The harvest follows the seed time"; and *Actor sequitur forum rei*, as "The agent must be in court when the case is coming on." The first of these, by the way, we do not find in Mr. Stimson's collection.

The Evelyns in America. Compiled from Family Papers and other Sources, 1608–1805. Edited and annotated by G. D. Scull. Printed for private circulation, by Parker & Co., Oxford. 1881. 8vo, pp. 392. (250 copies.)

IN 1879 Mr. Scull printed the 'Memoir and Letters of Captain William Glanville Evelyn,' a volume of 140 pages. Reprinting this, he now adds a copy of a paper by the late Sebastian F. Streeter on George Evelyn, the first commander of Kent Island, in Maryland, from 1636 to 1649, originally issued by the Maryland Historical Society in 1868; a reprint of the rare 'Description of New Albion,' published in 1648; a letter from Robert Evelin, who lived in America from 1638 until 1648; together with letters of Colonel Harcourt written in 1776–7, during his service in this country in the British Army; extracts from the journals of Captain John Montresor, an officer of Engineers of the British Army serving here both before and during the Revolution; brief memoirs of other British officers who belonged to the forces engaged in that struggle; a memoir of Robert Evelyn, who was the first of the family to come to this country, settling in Virginia in 1608; and a short notice of the last Evelyn here, William, an officer in the British Army, who lost his life by shipwreck on the island of Cape Breton, Canada, in 1805. Thus we have the different members of an old English country family more or less connected with this country for two centuries. Nearly all the material here brought together has been gathered in successive visits at Wotton, the home of the Evelyns, and at Nuneham, the home of the Harcourts; and it is characteristic of the pride taken by the heads of these houses, that both the text and the illustrations, consisting of portraits, maps, and views, have been largely furnished in proof of the interest felt in reviving the memories that thus unite the two countries in common history.

The narrative of the experiences of the earlier Evelyn visitors belongs to that antiquarian and almost traditional period of American history which is sure of the attention of a few earnest students. The story of poor young Captain Evelyn is full of pathetic interest. He was a gallant soldier who had given promise of a successful future by his share of the campaigns on the Continent, and whose career was cut off by his untimely death in New York, from wounds received in an engagement on Long Island. Even his grave is unknown, although it is certain that he was buried in New York. His letters are full of characteristic touches. Landing in Boston, he at first adopted the view common with all he met, that the outbreak of the rebellion was premature, and that peace would soon be restored. He lived long enough to see and acknowledge that the struggle was in dead earnest, and that it would need judgment at home and ability in the field to bring the operations of the British forces here to a successful conclusion. Captain Montresor had even better opportunities of forming a right judgment on the subject, for he spent twenty years here in engineering service, built the works at Mud Fort on the Delaware in 1772, planned the operations by which it was reduced in 1777, and was the principal engineer of the British forces. His note-book furnishes interesting memoranda as to the character and actions of the prominent commanders of the English army. As early as 1773 he was offered a tempting position by the Pennsylvania authorities, but this he refused, "from the appearance of the times, savoring much of an Inclination to Rebellion." He is as sharp in criticising the American as the English leaders, and sums up the matter as a "String of Blunders, wound up by the greatest Blunder of all Blunders, a blundering, disgraceful Peace."

Mr. Scull has shown great industry in collecting the material of his volume, and it is to be hoped that he will revise and recast it in such shape as will make it a book likely to command an early publication through the ordinary channels, and thus become accessible to the public. One thing suggested by it is that what Kapp has done in scholarly fulness in his lives of the German officers who served in the Revolutionary War, and in his account of the curious career of Bollmann, still remains to a very large extent to be done both for England and France. The Rochambeau Papers, now deposited in the Congressional Library at Washington, waiting the tardy action of Congress on the offer of its present owner, ought to supply much material of an interesting kind. The 'Life of Fersen,' by Klinckowström, showed the part taken by that enthusiastic lover of France in the campaign of the French forces here. The letters and memoirs of Miot de Melito relating to his stay in this country will, if published, no doubt give a vivid picture of life as he saw it. Meanwhile, the capacity of Americans as buyers and readers of books such as Mr. Scull's 'Evelyns' can hardly be gauged so long as the work remains "privately printed."

BOOKS OF THE WEEK.

Abbott, Alice Irving. Circumstantial Evidence. New York: W. B. Smith & Co.
American Classics for Schools. Longfellow. Boston: Houghton, Mifflin & Co. 60 cents.
Beard, G. M. Trance and Muscle-Reading. New York: The Author.
Brockhaus's Conversations-Lexikon, Parts 8-10. New York: L. W. Schmidt.
Brook, Sarah. French History for English Children. Revised ed. New York: Harper & Bros. $1.
Chicago River and Harbor Convention of July, 1847. Chicago: Fergus Printing Co. $1.

WILL PUBLISH MONDAY:

John Stuart Mill.

A Criticism. With Personal Recollections. By Alexander Bain, Emeritus Prof. of Logic, University of Aberdeen. 12mo, $1 25.

James Mill.

A Biography. By Alexander Bain, Emeritus Prof. of Logic, University of Aberdeen. 12mo, $2.

D. Appleton & Co.

Have just published:

I.

The Rhymester;

Or, THE RULES OF RHYME. A Guide to English Versification. With a Dictionary of Rhymes, an Examination of Classical Measures, and Comments upon Burlesque, Comic Verse, and Song-Writing. By the late Tom Hood. Edited, with Additions, by Arthur Penn. 18mo, cloth extra (uniform with 'The Orthoëpist' and 'The Verbalist'), price $1.

Three whole chapters have been added to this work by the American editor—one on the sonnet, one on the *rondeau* and the *ballade*, and a third on other fixed forms of verse; while he has dealt freely with the English author's text, making occasional alterations, frequent insertions, and revising the dictionary of rhymes.

II.

THIRD EDITION, REVISED.

Shakespeare from an American Point of View;

Including an Inquiry as to his Religious Faith and to his Knowledge of Law; with the Baconian Theory considered. By George Wilkes. Third edition, revised and corrected by the author. 1 vol. 8vo, cloth, 484 pages, price $3 50.

III.

History of France.

New volume in "History Primers," edited by J. R. Green. By Charlotte M. Yonge. 18mo, cloth, flexible, price 45 cents.

For sale by all booksellers, or sent by mail, post-paid, on receipt of price.

D. APPLETON & CO., Publishers,
1, 3, and 5 Bond Street, New York.

NEW ENGLISH BOOKS

At 25 Cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

THE

Principles of the Law:

AN EXAMINATION OF THE LAW OF PERSONAL RIGHTS,

To discover the Principles of the Law, as ascertained from the Practical Rules of the Law, and harmonized with the Nature of Social Relations.

BY A. J. WILLARD.

[From the Philadelphia *Press.*]

"A calm, dignified, able, and exhaustive treatise of a subject which is of great importance to every one. Mr. Willard first discusses the nature and origin of rights, obligations, and powers of fundamental social law and institutional law. He then expounds the science of the law, and defines the nature of all species of obligations and contracts. A general view of rights and powers is then brought forward, and a consideration of their special functions—as, for instance, the use of air and water and the principles of individual sustenance. The doctrine of individual redress and protection is thoroughly examined, and a long and interesting discussion follows of nuisances, wrongs, and injuries. The characterization of duelling, and the pithy and convincing way in which its absurdity is shown, are admirable. The final chapters are a logical deduction of what has gone before, and the doctrine is applied to all sorts of contracts, such as marriage, which is defined as 'an individual association for coöperative purposes,' the family and communal and general association. The treatment of the subject is so clear and logical, so simple and scholarly, that it deserves the highest praise. It is a work such as Aristotle might have written, had he lived in this day."

Octavo, cloth, price $2 50.

GEO. H. ELLIS, Publisher,
141 Franklin Street, Boston, Mass.

A GENERAL INDEX

TO

The Nation.

From July, 1865, to September, 1880.

Net price (no trade discount), $2 50. Purchasers will please remit with order. Address Publisher of the *Nation*, Box 794, New York, or Q. P. INDEX, Bangor, Maine.

A BIOGRAPHY OF

The late Leonard Bacon

Seems to be called for by the many grateful and appreciative notices of his life which have recently appeared. Aid in preparing the work is earnestly asked of any persons who may have in their possession letters or other documents which can be of use. Such documents will be carefully preserved and returned if desired. They may be sent to the Misses BACON, 247 Church Street, New Haven, Conn.

SECOND ANNUAL EXCURSION, July 24 to August 24, Yellowstone National Park. For particulars enclose stamp to

The Nation.

NEW YORK, THURSDAY, MARCH 16, 1882.

The Week.

Owing to the heavy disbursements of the Treasury for 3½ per cent. bonds redeemed under the 107th call, the New York banks gained heavily in reserve during the week. Last week's deficiency of $2,618,050 was made up, and a surplus of $687,825 established. Foreign exchange ruled during most of the week at about the gold-exporting point, but only $750,000 gold was shipped, and this on a special transaction. Since this shipment the rates for sterling have fallen so that gold cannot be exported except at a loss, and bankers think that the outflow is checked for the present. The money market was very easy for borrowers during the week, and in all the foreign money markets the tendency was to ease and lower rates. At the Stock Exchange it was a week of excitement and wide fluctuations. The tendency during the early part of the week was to lower prices, and in several stocks there was a heavy decline, notably in the coal shares, which fell from 4 to 17½ points. All manner of rumors calculated to create distrust were set afloat. Among others was one that an important bank was in trouble and would be forced to suspend. The only foundation for this was the fact that, the week before, a clerk who had charge of the call-loan department in the Fourth National Bank of New York, had abstracted about $80,000 from the securities pledged as collateral for these loans. The bank lost $70,000 by the theft, but was able financially to bear the loss, as it has a capital of $3,200,000 and a surplus of $1,161,822. The week closed at the Stock Exchange with prices improving, and with a fair show of returning confidence.

The "disquieting rumors" recently circulated in Wall Street about the "Gould stocks" culminated on Monday in a rumor that Gould himself was in a very shaky financial condition, and had been obliged to apply to W. H. Vanderbilt for a loan of $10,000,000—a sum so large as to suggest the possibility of a refusal even from a man of Mr. Vanderbilt's known wealth and benevolent disposition. As this sort of thing has been going on for some time, Gould felt that energetic measures were needed to put an end to it, and he accordingly sent for three of his most trusted friends, Messrs. Field, Sage, and Work, and told them the simple story of his real position. He had in his safe a "stack" of about $50,000,000 worth of securities, which stood in his own name and were entirely unpledged. He therefore asked his three friends to examine them and see for themselves whether what he said was true, and whether there was any reason for circulating stories against his credit. The committee at once went to work, and on counting the securities found that what Gould said was neither more nor less than true. The result of the examination was to cause an immediate rise in stocks, and the authors of the stories are now very hard to find. This method of setting at rest disquieting rumors derives a good deal of interest from its novelty. Usually a man does not make a statement of his affairs, or call in a committee to count his assets, until he and his creditors are both so disquieted as to them that they feel it necessary to decide whether he had better make an assignment; and the result of such investigations, even into the affairs of great financiers, though it may set at rest disquieting rumors, generally does so by bringing to light most depressing facts. That the investigation in Gould's case should have resulted in showing him to be one of the most impregnably solvent men in the world, and should have been followed by a universal feeling of buoyancy on the street, and in fact throughout the country, cannot but be gratifying to every man of good feeling. Gould has absorbed and consolidated so much of the available wealth of the country, that any attack on his credit is getting to be in its character and effects more and more like an attack on the credit of the United States. He is no longer a daring operator, gambling and plundering on his own account, but has become part of our national life. When He prospers, we all prosper with Him, and when disquieting rumors are set afloat about Him, we all look anxiously at the "ticker." There is something almost touching in the surprise which, according to Mr. Sage, the strong, silent man expressed, "that people should use his name in the way they had without any facts whatever to justify them."

The general approval with which the nomination of Judge Blatchford to the Supreme bench is received will probably convince the President that the public entirely agrees with the idea which he seemed to have acted upon at the time of Judge Gray's appointment—viz., that in making selections for judicial offices judges of high standing in the lower courts are a very good class to select from. Judge Blatchford, though not a man of genius, is one of the best judges on the Federal bench. His familiarity with admiralty law is unusual, and his capacity for the despatch of business is enormous. He has had precisely the same disadvantage to contend with in his judicial career that has been an obstacle in Judge Gray's path—the fact that his manners on the bench are not "popular." He undoubtedly displays that impatience with professional ignorance and incompetence which elective judges, for very good reasons, are usually careful to avoid showing; but he has always had the respect of the bar, and his appointment will be regarded among lawyers as a distinctly strong one.

Scarcely less gratifying to the country than the appointment of Judge Blatchford to a place on the Supreme bench will be Mr. Edmunds's refusal of it; not because it can be doubted that the accession of so good a jurist as Mr. Edmunds would have been a very valuable addition to the strength of that tribunal, but because, while several men might be found in this part of the country who would make excellent members of the Supreme Court, it would be very difficult to find one who could fill Mr. Edmunds's place in the Senate. There may have been broader statesmen and greater orators in that body, but it has perhaps never had a member who more thoroughly understood the real business of legislation, who was more quick in the detection of questionable schemes and loosely drawn provisions, keener and more untiring in watching every day's proceedings, and readier to object and more merciless in his opposition to everything that seemed to him wrong or open to suspicion than Mr. Edmunds is. It is no exaggeration to say that Mr. Edmunds's presence in the Senate has not only prevented the passage, but discouraged the very introduction, of many a job in that body, and that therefore it is worth millions annually to the people of the United States. Every American citizen who desires good government, whatever his political creed, should therefore be in favor of keeping Mr. Edmunds, strong partisan though he is, where he can do more good than any successor whom he would be likely to have could hope to do.

Mr. John Russell Young's nomination to the Chinese Mission must be considered the President's special concession to General Grant, Mr. Young having of late years been one of the General's most devoted adherents and his historiographer during his celebrated tour round the world. The nomination was, we believe, urged by him on General Garfield, who persistently neglected to make it. This caused much ill-feeling, and helped to spread and intensify the belief in Stalwart circles that he was not the man for the place. It is to be said for Mr. Young that he has been in China, and is probably as competent as any one that could be selected to explain to the Chinese Mandarins the exclusion of their countrymen from the United States under the bill now pending, and the reasons why we consider the Burlingame treaty a huge mistake. It would, however, probably take five Stalwart ambassadors to make clear to the Chinese mind—hardened by so many ages of routine—what the American position toward foreigners now is. Luckily for the American Minister, all discussion of the subject will have to be carried on through an interpreter, and will thus be characterized by a most convenient obscurity, though we doubt whether it could be made lucid by any master of language now living. Human expression, like all things human, has its limitations.

The Committee of Ways and Means have agreed to report a bill lowering the tax on distilled spirits from ninety cents per gallon (the existing rate) to fifty cents, with the purpose and expectation of reducing the revenue and the annual surplus in the Treasury. If the proposed reduction of the rate were likely to have the intended effect, the measure would

be indefensible. Any government which requires a large revenue ought to adjust its system of taxation in such manner as to derive the largest possible sum from luxuries, and especially from injurious luxuries. Whiskey is at once the most injurious and the most common luxury in use in this country. It is a clear departure from good morals to adopt legislation for the purpose of making it cheaper to the drinking classes. But in adjusting the whiskey tax Congress is supposed to have the fiscal needs of the public treasury in view rather than any standard of morals. The reduction of the tax, therefore, can only be justified upon the theory that *more* revenue can be obtained from a rate of fifty cents than from one of ninety cents. The history of the whiskey tax, however, shows that a rate of fifty cents, with the supplementary license taxes, is about the highest rate that can be collected. This rate is equal to 250 per cent. on the average cost of the article itself, and is probably as high a percentage as can be imposed without leading to illicit distillation. The average cost of whiskey without the tax is twenty cents per gallon. Mr. David A. Wells estimates that the entire cost to the illicit distiller in the way of bribery, night work, unusual methods of transportation, fines and penalties, is twenty to forty cents more. That is to say, if the tax is fixed at about fifty cents per gallon, nobody will have an incentive to produce the article without paying the tax. This view seems to be sustained by statistics. Under the tax of fifty cents, which existed from 1869 to 1872, the revenue ranged from $45,000,000 to $55,000,000 per annum. In 1872 the rate was increased to seventy cents, but the revenue showed no perceptible increase. In 1875 it was advanced to ninety cents, and still the revenue remained virtually stationary, being for 1879 $52,000,000 and for 1881 $61,000,000; whereas it should have been, on an equal distillation, about $80,000,000. The population of the country has increased largely during the interval, and the consumption of liquor has apparently not diminished per capita. The inference is irresistible that illicit distillation has been carried on to a great extent under the tax of ninety cents, and it is highly probable that a reduction to fifty cents would cause no loss to the Treasury, and it might even prove a gain.

The latest "downfall of an old and trusted clerk" differs from usual occurrences of the kind so far that surprise at the event is not universal. Many persons, including the bank officers of course, are amazed. They would have suspected almost anybody sooner than Cornwell. One of these startled observers is reported as saying that he would have lent him one or two thousand dollars upon his own security without hesitation. Another asks, in a dazed and hopeless way, "Whom can we trust?" On the other hand, there are persons who say very frankly that they are not surprised at all; that the "old and trusted clerk" was guilty of financial irregularities years ago, and that, whomsoever they might trust, they never would have thought of trusting him. This testimony comes from what is often the moral stronghold of the defaulter. An officer of a prominent church in Brooklyn and a member of another one in the same city are among the witnesses. The latter "did not seem greatly surprised at the news," and said, "So Dick Cornwell's an embezzler, is he? Well, it isn't the first time he has played the same trick." He then recalled how "he was a zealous Christian, could pray well, was a hard worker in the Sunday-school," and so commended himself to Mr. Dollner, the church officer mentioned, that the latter lost $80,000 by Cornwell. A contemporary selects, from several morals which the Fourth National Bank affair presents, one to the effect that the salary of the loan clerk, $2,000, was not enough to secure a good article of honesty. The bank officers say they paid Cornwell at least twice as much; but it seems to us that there are two morals a great deal better than our contemporary's. When a church gives a member a character as "a zealous Christian," who can "pray well," is it not under some obligation to modify its certificate upon discovering that it does not cover such little idiosyncrasies as embezzling money? When a bank engages a clerk is it not wise, besides inquiring into his church and Sunday-school relations, to get some information as to his business conduct and standing?

The second dinner in the series which the local Stalwarts seem to be giving each other, took place on Saturday night. The honored guest on this occasion was Captain Michael Cregan, much better known, however, as Mike Cregan. Mike moulds, and indeed generates, Republican opinion in the Sixteenth Assembly District, as president of the district association, and for this reason was presented to the dinner party by the chairman as a "Stalwart statesman," but, considered as a private citizen, he is simply clerk of one of the Civil Justices. The reason for fêting him was his return from a two months' sojourn at the Hot Springs of Arkansas. It is to unwillingness to attend Mike's primaries and to confer with him on the state of the country and the best means of purifying and elevating our politics that our ministers, lawyers, and well-to-do persons generally, in this city, of the Republican persuasion, owe much of the odium which is heaped on them by politicians for "neglect of the first duty of a citizen." It will thus be seen that the dinner was a very important occasion. There was a letter read from Roscoe Conkling, expressing very warm feelings toward Mike, which led to three cheers for "the combination, Conkling and Cregan," and ex-Senator Platt wrote a letter recommending the promotion of the guest from the titular rank of "Captain" to that of "Major-General," which was followed by "three cheers for Me Too." None of the very great Stalwarts were present however, Mr. Conkling, General Grant, and Mr. Folger confining themselves to writing letters. But of Stalwart statesmen of the second order, the class to which Mike himself really belongs, there were present Jake Patterson, Barney Biglin, Johnny O'Brien, and others less known to fame.

The Anti-Polygamy Bill has passed both Houses, and will soon be a law. Its most direct, and indeed one may say its only direct, effect is to take the government of the Territory out of the hands of the Mormons. This may prepare the way for further punitive legislation against polygamy, but the present bill has really no terrors for any polygamist who cares nothing about voting or holding office. If he chooses to stay "out of politics," it will not inconvenience him in his domestic relations to any appreciable extent. But it is undoubtedly better that a local legislature of some kind should attack the polygamist in his home than that Congress should do it. It will know better how to get at him when surrounded by his wives, because it will know better what kind of proof of polygamous practices is easiest to provide.

Congress has probably never done anything more ambitious in the way of buncombe than the passage of a bill by the Senate creating a commission to examine the connection of the liquor traffic with revenue, taxation, crime, pauperism, social vice, the public health, and general welfare. There is probably no social question which has been so thoroughly examined as the liquor question. There is none on which such a mass of statistics have been collected. It is well established that drink is the cause of a very large part of all the crime and pauperism there is in the Western world. It is well known that a large—very large—revenue can be and is raised from it by civilized nations. In England nearly one-quarter of the national income comes from it. That excessive drinking is injurious to the individual health and morals is also so well settled that no rational person ventures to deny it. Whether moderate drinking is injurious to the health or not is a point on which doctors and physiologists are greatly, and apparently hopelessly, divided, and no re-examination of them by a Congressional commission would do anything but make confusion worse confounded. Opinions on this subject, as on all questions of health, are and must ever be greatly affected by individual experience, and individual experience about alcohol, as about tobacco, will always vary greatly, just as it varies greatly about cucumbers. All the doctors in the world cannot persuade a man who likes cucumbers, and knows they agree with him, that they are bad for him. The only question connected with the liquor traffic that a legislature can hope to throw light on by inquiry, is the question whether moderate drinking promotes excessive drinking, and whether, if so, all drinking can or ought to be suppressed, or nearly suppressed, by legislation. The only country in which any experiment has been made in this direction is the United States, and it would be interesting to know for certain what the result has been—a subject which is at present enveloped in fog. In fact, we doubt much whether this last point is not the only one on which official inquiry can do us any good, because, touching the consequences of moderate drinking, we should have to rely much on the experience of foreign countries, in which moderate drinking prevails extensively; and this an

American Commission is not likely to be able to investigate with any profit.

It would appear from the correspondence between the Civil-Service Reform Association and District Attorney Woodford that General Curtis, who has just been indicted for levying assessments on officeholders, tried to prevent witnesses from appearing against him by privately threatening them with dismissal. He, therefore, had to have his attention called to the statute prohibiting such intimidation of witnesses, and prescribing for the offence the very unpleasant penalty of six years in the penitentiary, which is far worse than the penalty for the offence with which he is now charged. There is, we believe, no desire on any one's part to pursue him vindictively, but if the system of extorting money, of which no public account is ever rendered, from poor men for campaign purposes, is to be stopped, somebody must be made an example of, and it is unfortunate for General Curtis that he should be the first to offer himself for this purpose. Still, if levying assessments be the harmless practice which he and some of his friends think it, he ought to meet the consequences like a man, without flinching or shirking. He has just moved the quashing of the indictment on the ground that his first name is not "Nehemiah," but Newton. It will be interesting to have the Assistant District Attorney's explanation of this mistake.

The excitement caused in England by the reluctance of the Londoners to part with the elephant Jumbo in the Zoölogical Gardens in that city, which Mr. Barnum had purchased for $10,000, is probably the best advertisement which that enterprising showman has ever received. In fact, it is so good, so like what he would himself imagine in his wilder dreams, as to lead many people to suspect that he got up the opposition himself, and that even Jumbo had been bribed with cakes to join his keeper in a show of pathetic reluctance to come to America, for the purpose of trumpeting his own fame and increasing public curiosity about "the greatest show on earth." The application for an injunction to Judge Chitty to restrain Jumbo's departure seems on the surface so absurd as to suggest to many that this, too, was applied for by Barnum himself, and that in spite of his telegram to his agent to resist it with able counsel, nobody is more amused by its refusal than he is. This is, however, to our mind a very superficial view of the matter. Few who have long watched British policy can doubt that the hostility to Jumbo's embarkation, and the transfer of the biggest elephant in the world to this country, has been sincere, but it is equally certain that the opposition would never have been attempted had Mr. Blaine remained in office. It was the pusillanimous course of Mr. Frelinghuysen toward Chili which first suggested the retention of the animal by force or fraud, and the application for an injunction. That Judge Chitty was deterred from granting it by private instructions from the Ministry, under the influence of the recent Whitthorne speech on foreign affairs in the House of Representatives, seems only too probable. The affair is now over, but we wish it had not occurred without a despatch from Mr. Blaine laying down the true American doctrine with regard to the big elephants of American citizens. There is no monarchical Zoölogical Garden which would not be the better for being penetrated by a few of his thunder tones on this question.

Mr. Gladstone has carried his vote of censure on the Peers for instituting an inquiry into the working of the Land Act, by 303 to 225, although the Parnellites did not vote. A majority of seventy-eight, under these circumstances, and in spite of all the late difficulties and disappointments, shows that the strength of the Ministry is substantially unimpaired. The censure of one House by the other seems somewhat startling to those who are only familiar with the two-chamber government under our system. Such a censure would be a great breach of propriety here, because both chambers are elected, and one has just as much constitutional weight as the other. In England the Lords have been in a position of subordination to the Commons ever since the Commons obtained the power of imposing a responsible Ministry on the King. The Commons now decide who shall carry on the Government, whatever the Lords may think, and in order to enable the man of its choice to carry on the Government, it has to arm him with sufficient strength to overbear a hostile majority in the Lords. This is done sometimes by rebuking the Peers, as now, or, in case of extreme necessity—as at the passage of the Reform Bill—by making or threatening to make a ministerial majority in the Lords by the creation of new Peers. Under better leadership than Lord Salisbury's, the Peers would avoid collisions like this, which make a formal revelation of their weakness.

The *Herald* publishes a very curious letter addressed by Mr. Adams, our Minister in Bolivia, to Mr. Belford, a member of Congress from Colorado. Mr. Adams complains, in very emphatic language, that his position is becoming ridiculous and intolerable, because the Chilians are opening and inspecting his official as well as private correspondence before it reaches him, and that he has reason to believe the Chilian authorities to be cognizant of this outrage. It may be thought somewhat remarkable that Mr. Adams should complain of such things to a member of Congress instead of to the State Department. But among the many extraordinary things in connection with our South American diplomacy to which we have become accustomed of late, such a little eccentricity as the letter of Mr. Adams to Mr. Belford appears rather insignificant. He gives also evidence of a very strong bias against the Chilians, which rather weakens the force of his statements. But his charge that the Chilians tamper with his official correspondence is a very serious one, and if he can bring sufficient proof to make a *prima-facie* case, it would certainly be in order for our Government to take notice of the matter and to make the Chilians understand that, while we are not inclined to put our fingers unduly into other people's business, we are determined to keep other people's fingers out of our own.

The more Mr. Blaine's Pan-American Synod is examined the more it seems to impress the imagination. It has already apparently in some parts of South America assumed the character of a sacred scheme, which must not be lightly criticised, and particularly that feature of it in which Mr. Blaine offered in the handsomest manner to pay for the hall in which the august body was to sit. A Guatemala editor has been commenting on it in terms which we should here consider mild and playful, whereupon the American Minister, Dr. Logan, complained of him to the President of the Republic, who incontinently put him in a dungeon, and suspended the publication of the paper. The American residents are said to be disgusted, because the Minister, if he did not foresee the view which the President would take of the offence, has not exerted himself to undo the mischief he had done and get the editor out of the dungeon. But he probably thinks a dungeon is just the place for such a wretch. The truth is, that the foreign agents of a Government take a long while to get over the disordering effects of even a few months' Jingoism on the part of their chief. The British Ministers and Consuls were set nearly crazy by the Disraeli administration, and committed every variety of folly, for which they are now all mourning. Sir Henry Layard, at Constantinople, under the frenetic influence from home, was suddenly transformed from an elderly quiet man of scientific tastes into a furious and denunciatory politician, and had the indecency to make savage attacks on Mr. Gladstone in his despatches.

The news from Montenegro that the Prince has ordered the mobilization of his little army is, if true, of considerable importance. It may indicate either that he is supplying himself with the means of preventing the violation of his own frontier by the Herzogovina insurgents, or that he anticipates such an extension of the insurrection as will compel him take part in it. In either case, the reports would throw doubts on the last accounts from Austrian sources of the subsidence of the troubles in Bosnia and Herzegovina. Whether it be true or not that General Skobeleff has been put under arrest and is now confined in a fortress, it is plain that the Czar feels the necessity of reassuring Austria in some emphatic way. The assertion of one Russian paper that the existing trouble, whatever it is, can only be settled by a European Congress, shows that the Russians are disposed to think it serious trouble. But the best guarantee of peace is, after all, to be found in the fact that two of the parties which would do the fighting if war broke out are not quite ready. Austria is not in a condition to undertake a great contest which might assume an anti-Slav character, because she is too dependent on Slavs for her strength both in men and money. Russia might be supposed eager for the fray as an escape from her domestic troubles, if it were not that she tried the same remedy in 1877, with the result of making her domestic troubles worse than ever.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

On Monday the President sent to the Senate the names of Samuel Blatchford and John Russell Young, of New York, to be Associate Justice of the Supreme Court and Minister to China respectively. Judge Blatchford has been Judge of the United States District Court since 1878. Mr. Young is a journalist who has, of late years, been connected with the New York *Herald*. He went around the world as the *Herald* correspondent with General Grant, who is said to have urged his appointment as Minister to China.

Letters from Mr. Conkling and Mr. Edmunds, declining the Associate-Justiceship of the Supreme Court, have been published.

The President has approved the act authorizing the use of naval vessels in aid of the sufferers from the Mississippi floods; the act for the purchase of the Freedman's Bank building; the act making an appropriation for the proposed Garfield monument; and the joint resolution in behalf of the American Company of Revisers of the New Testament for the return and remission of customs dues.

A statement having appeared in the London *Athenæum* that negotiations for a copyright convention between the United States and Great Britain had been suspended by President Arthur and Mr. Frelinghuysen, the State Department has furnished a correction, from which it appears that the state of the negotiations is this: A "projet" for a convention, which has been approved by leading publishers and authors, was submitted to Great Britain, and a counter "projet" has been submitted by Great Britain to the United States. They are now in the hands of the printer, and as soon as copies can be obtained, they will be submitted with a view to continuing the negotiations.

The bill prohibiting Chinese immigration for twenty years was passed by the Senate on Thursday. Two amendments proposed by Senator Farley, of California, prohibiting State courts from conferring citizenship upon Chinese, and decreeing that the prohibition of immigration should extend to skilled artisans as well as coolies, were adopted. The Democrats, with one or two exceptions, voted for the bill, and the Republicans, with the exception of the Senators from the Pacific coast and Senator Cameron, of Wisconsin, against it.

On Friday the Senate passed a bill providing for a commission to inquire into the liquor traffic, and take testimony as to the practical results of license and prohibitory legislation.

Mr. Edmunds's Anti-Polygamy Bill was passed by the House on Tuesday by a vote of 199 to 42. It was passed as it came from the Senate, without amendment. The bill makes bigamy and polygamy punishable as misdemeanors by fine and imprisonment. One of the most important features in it is the provision that in order to convict a man of either of these offences it will not be necessary to prove the rite of marriage.

Three memorials received from the Mormon authorities in Utah were laid before the House on Friday. These memorials protest "against hasty, reckless action in regard to the political disorganization" of the Territory of Utah, and purport to be signed respectively by 15,000 women, 12,378 men, and 10,966 "young ladies" of Utah. The "young ladies" and "young men" are said to include all the boys and girls over eight years of age.

The Utah Legislature adjourned *sine die* on Saturday evening. In the closing speeches there was a tacit recognition of the fact that the days of polygamous legislation were forever passed.

The House recently passed a resolution directing the Secretary of the Treasury to communicate all the information in his possession in relation to certain vessels, including the steamer *Bahama*, which was recently lost, and which were alleged to be unseaworthy. The vessels are said to have sailed out of the port of New York under the English flag with American certificates. In reply the Secretary has sent to Congress a letter from Supervising Inspector-General Dumont, who says that the records of his office fail to show that any steamer has ever sailed from the port of New York under the English flag with American certificates, and that there is no foundation in fact for the report that the *Bahama* sailed in that condition.

Mr. Belmont presented a resolution in the House on Monday inquiring by what authority Mr. Trescot had been employed since 1877, out of what fund he has been paid, and by virtue of what law he is now employed, and how he is paid. This resolution is said to be the result of the testimony recently taken in the State Department which showed that Mr. Trescot, under both Secretaries Evarts and Blaine, had the run of the State Department, and access to the files, and was allowed to take papers from them. Mr. Williams, chairman of the Foreign Affairs Committee, objected to the adoption of the resolution and insisted upon its reference. It will, however, probably come up hereafter.

The Senate Committee on Indian Affairs has agreed upon a bill to provide for the allotment of lands in severalty to Indians on reservations, and to extend the civil and criminal laws of the respective States or Territories to each Indian to whom land is so allotted within their boundaries. The orders for the allotments are to be made by the President of the United States at his discretion, but the bill prescribes that 160 acres of agricultural land shall be patented to each head of a family, and eighty acres to each single person over eighteen years of age, and to each orphan child. The land thus acquired by the Indians is to be inalienable and free from taxation for a period of twenty-five years from the dates of the patents.

Indian Agent Armstrong has preferred a request to the Secretary of the Interior that 100 Crow children, under his charge at the Crow Agency in Montana, be sent to certain farmers in Ohio who have asked for them, to be educated for a useful career, and Mr. Kirkwood instructed the agent to send such children as might wish to go.

A report of the Secretary of War shows that our Indian wars in the last ten years have cost $5,058,821.

The floods in the South and West continue. Over 50,000 people have been driven from their homes, and the loss in property, chiefly cotton crops, is estimated at over $40,000,000. The Mississippi River continues to rise, and there is danger that the city of New Orleans may be flooded.

The distress in the Mississippi valley, resulting from the overflow and broken levees, has opened anew the whole question of Mississippi River improvements, and the House Committee on the matter have agreed to report a bill embodying a plan for long stretches of levees to confine the river in narrow limits, on the theory that it would cut its own channel by the "scouring-out" process operating at the jetties.

The National Board of Health is said to be considering the question of assuming charge of the New York Quarantine, on account of the alleged failure of the present Quarantine officers to detain immigrants affected with smallpox.

Bail was fixed in the Star-route cases in the Criminal Court, at Washington, on Tuesday and Friday. Brady gave bonds for $20,000, the two Dorseys for $10,000 each, and the other for smaller amounts. Mr. Bliss, counsel for the Government, urged that some time be fixed for pleading, as the Government wished at least to get the conspiracy cases on trial before summer. Mr. Wilson, for the defence, replied that he thought they would be prepared to plead one week from Thursday, and that the court could then fix a day for argument. This arrangement was accordingly agreed upon.

The record in the Flipper court-martial case, together with Judge-Advocate-General Swaim's report, have been submitted to the President. General Swaim is understood to recommend a mitigation of the sentence of dismissal, on the ground that Flipper, while convicted of certain violations of the army regulations, was acquitted of the criminal acts charged against him. The general impression is that the sentence will be mitigated.

The findings of the court-martial in the case of Sergeant Mason, who shot at Guiteau last September, were made public on Friday afternoon by an order issued by General Hancock. The court-martial finds him guilty of the charge, and pronounces sentence as follows: "To be dishonorably discharged from the service of the United States, with the loss of all pay and allowances now due or to become due to him, and then to be confined at hard labor in such Penitentiary as the proper authorities may direct, for eight years." General Hancock's order states that the findings have been approved, and that sentence will be duly executed. The Penitentiary at Albany is designated as the place of Mason's confinement.

District Attorney Corkhill has finished the examination of the bill of exceptions in the Guiteau case. He says that a large part of it refers to the medical testimony, but that it is a remarkable fact that there is no exception to any part of Dr. Gray's testimony. The exceptions will probably be argued before the General Term some time in April.

A malignant attack on President Garfield appeared in the Washington *Post* on Friday, over the signature of "Justice." The communication excited great indignation, and many unavailing efforts have been made to discover its authorship. The following sentence indicates its character: "Garfield was a treacherous, a cowardly, a hypocritical man, selfish to the extreme, and not caring what happened so that it did not happen to himself."

There have been disturbances in Omaha, Nebraska, occasioned by large strikes, and the Governor of the State, apprehending serious trouble, asked the President to authorize the use of United States troops, in addition to the militia, to suppress the disturbances. The President consented.

The strikers at Omaha held a meeting on Sunday afternoon, at which 3,000 people were present. Speeches were made exhorting the Labor Union to stand firm, and abusing the authorities. Four ringleaders of the strike have been arrested and put under bonds.

In a communication to the Secretary of the Navy, Captain Meade, commander of the *Vandalia*, reports, under date of March 1, the result of his personal observation on the Isthmus of Panama. He says that the canal company has been quietly at work preparing for the gigantic task before it, and has accomplished a large amount of preliminary work. The entire line has been cleared of underbrush for a width of about 300 yards, and all along the line the company has constructed stations and villages for its laborers. The machinery brought from Europe is clumsy and comparatively antiquated, and Captain Meade says he hears that most of the machinery will be made in the United States hereafter.

Another oyster war seems imminent in Virginia. A fleet of "alien oyster vessels" is depredating upon the oyster beds of the Rappahannock and other streams of the State, and spreading terror among the inhabitants of those regions, in defiance of the laws of the State and unawed by Governor Cameron's recent expedition and subsequent proclamation.

John McCullough, one of the leading Machine politicians and bosses in Philadelphia, declared recently in the Council Chamber in that city, that he was dissatisfied with the

methods of the bosses, and announced his faith in reform within the Republican party of Philadelphia.

Mr. Maretzek, who was appointed to succeed Mr. Thomas as director of the Cincinnati College of Music, has followed Mr. Thomas's example, and severed his connection with the college. He asserts that his contract with the college has been grossly violated, and that no alternative was left him.

Another heavy bank defalcation was brought to light in New York on Thursday. R. H. Cornwell, the "aged loan clerk" of the Fourth National Bank of that city, had pledged $70,000 worth of securities belonging to the bank, to cover margins on stock speculations. Cornwell was "prominent in Methodist Church circles," and possessed all the other virtues which are necessary to a defaulting bank official.

The Rev. Henry Highland Garnet, a prominent colored clergyman of this city, of slave parentage, and recently appointed Minister to Liberia by the late President Garfield, died at Monrovia on the 13th of February.

FOREIGN.

The anniversary of the assassination of the Czar Alexander II. was celebrated in St. Petersburg on Monday, by a solemn service at the Cathedral of Sts. Peter and Paul. The Czar visited his father's tomb, and dismissed his escort while driving through the streets of the city on his return.

General Skobeleff has again made trouble by his speeches. This time he delivered an address to a number of Russian officers, stating that "the best Russian is the Czar," and that Europe knows what he thinks on the Slav question. He added that his recall was only a new humiliation proceeding from "the man who, with blood and iron, had founded an empire which must be destroyed by Russian blood and iron." The Czar is reported to have rebuked Skobeleff for his former speech, telling him that he had by his remarks irritated Germany and destroyed the hope of her acting as a mediator in the Slav question, and that, thanks to him (Skobeleff), "Russia feels herself derided, hooted at, and completely isolated in Europe."

General Skobeleff, in reply to the Czar's rebuke, expressed contrition and declared that he had no intention of posing as a political agitator. The General reports that he was a great lion in France during his stay there, and that copies of his speech were distributed to the French army and fleet, and that he was "so overwhelmed with visiting cards and ovations from the officers of both that it was plain that all thought war was imminent with Germany." General Skobeleff related this in an interview which he had with General Ignatieff on his return to St. Petersburg. General Ignatieff "laughed heartily," and "they both parted on the best of terms."

The result of all this has been that war rumors have been assiduously circulated in Europe during the week, a sample of which was contained in a despatch from Constantinople on Thursday, which stated that in official circles war between Russia and Austria was thought to be inevitable; that the question of calling out the reserves was being seriously discussed, and that it had been at least decided in principle that some preparatory measures should be taken.

A majority of the Nihilists recently tried and condemned to death in Russia will present petitions to the Czar for mercy. By a decision of Procurator Muravieff the counsel will not be allowed to consult their clients alone, but only in the presence of gendarmes. The condemned have requested their counsel to render the last service in their power by being present at their death.

It is announced from Odessa that thirty Jews, possessing an aggregate capital of 35,000 rubles, have left Kieff for Palestine, where they intend to engage in farming.

The proclamation issued by King Milan, on the elevation of the principality to a kingdom, expresses gratitude to the European powers for their sympathy toward Servia, and says the national enthusiasm is a guarantee that in future the spirit of Servia's immortal liberator, Milosh, will be honored, and that the energies of the new King will be devoted to the dissemination of virtue and enlightenment.

At a council of the Austrian and Hungarian Ministers on Sunday, the Minister of War of the Empire announced the complete Austrian occupation of Crivoscie, but said he did not yet anticipate a withdrawal of the troops, and that fortifications on the frontier, costing 1,500,000 florins, would be required. This amount, together with the sum necessary for maintaining the troops on a war footing, will make necessary a fresh grant, and an extraordinary meeting of the delegation will accordingly be summoned for April.

It is stated that the Austrian Cabinet has decided to present a bill in the Reichsrath making provision for the budget deficit by the issue of 40,000,000 florins of five per cent. paper rentes.

A despatch from Vienna announces that Johann Strauss has been engaged for the new Casino in New York.

In Greece the Government has been defeated by the election of the Opposition candidate as President of the Chamber of Deputies, by a vote of 127 to 76. The Ministry thereupon resigned, and M. Tricoupis was intrusted by the King with the formation of a new Ministry.

The French Senate on Saturday, in discussing compulsory primary education, rejected by a vote of 167 to 123 an amendment requiring schoolmasters to teach pupils their duty toward God and their country.

A despatch from Paris says that M. Roustan, having to participate in the deliberations upon the financial and administrative reorganization of Tunis, will not leave for Washington before the middle of May. M. Outrey, the present Minister at Washington, will meanwhile remain there.

The Italian Consul-General in Tunis has protested against the insecurity of life and property in the Regency, and has declared that he will hold the Bey responsible in the event of Italians losing their lives. It was reported in Paris on Sunday that trouble was again imminent in Tunis, the insurgents having proclaimed Ali Kalifa, their leader, Bey; and that French flying columns would be immediately despatched from Gafsa and Gabes in the direction of the Tripolitan frontier.

Arabi Bey, Egyptian Minister of War, and six other leaders of the military movement, have been appointed Brigadier-Generals, with the title of Pasha. M. de Blignières, the French Controller-General in Egypt, has resigned, and it is stated that the foreign control of Egyptian affairs will be henceforth confined to financial functions, and the execution of the policy of France and England will be exclusively confided to their respective Consuls-General.

Herr Windthorst, the Ultramontane leader, has introduced a bill into the Prussian Landtag, repealing the law withholding emoluments from the clergy and abolishing penalties for saying mass and administering sacraments.

A supplement of the London *Gazette* states that the Queen has written to Sir William Harcourt, Secretary of State for the Home Department, that she wishes, before she leaves England on her trip to the Continent, to express how deeply she has been touched by the outburst of enthusiastic loyalty and devotion which her attempted assassination called forth from all parts of her vast empire, as well as the universal sympathy evinced by the sovereigns and peoples of other nations.

McLean, the Queen's assailant, has been committed for trial on the charge of high treason. On being arraigned on Friday, he said he would reserve his defence, and declined to cross-examine the witnesses. The evidence confirmed the statement that his pistol was sufficiently elevated when he fired for the ball to have struck the Queen. McLean is reported to have "laughed several times" at the evidence given by the Eton College students.

Mr. Gladstone's resolution relative to the House of Lords' inquiry into the working of the Land Act was carried by a vote of 303 to 235 on Thursday evening. The Parnellites left the House without voting. During the discussion previous to the vote the Marquis of Hartington, Secretary of State for India, and Sir Stafford Northcote delivered speeches. The former said that the Lords had put a grave obstacle in the way of governing Ireland, and their inquiry could not beneficially affect the Land Act. Sir Stafford Northcote said in substance that what the Lords had done was in the exercise of their undoubted right.

At a meeting of the Irish Parliamentary party in London, on Monday evening, it was determined to form Irish national independence associations, Ireland's "inalienable right to self-government" being proclaimed.

Mr. Lowell, United States Minister to England, replying to an application made in behalf of American citizens arrested in Ireland, recently said: "The Coercion Act is contrary to the spirit and foundation of the principles of both English and American jurisprudence, but is the law of the land, and controls all persons domiciled in the proclaimed districts of Ireland, whether British subjects or not. It is manifestly futile to claim that naturalized citizens of the United States should be exempted from the operation of the Act."

A large number of copies of the *United Ireland* were seized in Cork on Thursday, and the paper has since suspended publication James Rourke, the business partner of Mr. Egan, the treasurer of the Land League, was arrested under the Coercion Act in Dublin on Thursday, on the charge of intimidation.

Archbishop McCabe, of Dublin, has issued another pastoral denouncing recent outrages in Ireland, and stigmatizing recent associations as encouraging murder.

A meeting was held at the Mansion House, in London, on Wednesday, the 8th, to discuss the question of bi-metallism. Letters of approval of bi-metallism from the French and German Ministers were read. Minister Lowell and the Ministers from Greece, Holland, Rumania, and Chili were present. The Governor of the Bank of England and several members of Parliament spoke to resolutions in favor of the free coinage of silver and the objects of the Paris Conference. The resolutions were carried. About 1,200 people were present, including many prominent business men. The London *Times* deprecated the meeting as calculated to foster a delusion abroad that England intends to tamper with the currency.

It is announced that at the approaching Consistory the Pope will create seven new Cardinals, including the Reverend Dr. McCabe, Archbishop of Dublin, the Archbishops of Seville and Algiers, and the Patriarch of Venice. It is understood that Archbishop McCabe's promotion expresses the Pope's approval of the efforts he has made in the cause of law and order in Ireland.

The Volksraad of the Orange Free State has refused to allow President Brand to accept the Grand Cross of the Order of St. Michael and St. George, offered him by Great Britain for his services in connection with the settlement of the Transvaal difficulty.

Giovanni Lanza, one of the most prominent of Italian statesmen, died on Thursday. He was Minister of Finance under Count Cavour, was twice elected President of the Chamber of Deputies, and, on the downfall of the Menabrea administration, was entrusted with the formation of a Liberal Cabinet.

TUESDAY, March 14, 1882.

THE REPUBLICAN PARTY AND THE CHINESE BILL.

In spite of the indignation excited among some by the speech of Mr. George, of Mississippi, on the Chinese Bill, in which he assumes the bill to be a confession that this is "a white man's Government," and that the enfranchisement of the negroes at the South is simply an experiment, there is no doubt that he is right in his interpretation. Others have doubtless perceived the remoter bearings of the measure as well as he, but to him belongs the merit of having pointed them out with candor and clearness. For this he is entitled to thanks rather than abuse. It is only fifteen years since the close of the war, and less than fifteen since the passage of the latest constitutional amendments, and yet the Republicans in Congress seem to have already forgotten the principles for which they then contended and which they compelled the South to adopt at the point of the bayonet.

The first and foremost of these was, that in the United States no man should be deprived either of the protection of the laws or of participation in the government by any disqualification which could not be removed by any exertion on his own part. The States were, therefore, all forbidden to exclude any man from the franchise on account of "race, color, or previous condition of servitude"—or, in other words, on account of any defects which he could not possibly cure. They might exclude him because he was ignorant, or because he was poor; but they might not exclude him because of his ancestry or his complexion, or because somebody had in times past done him a wrong.

The second principle was that the fundamental rights of men dwelling in the United States were not to be left at the mercy of local passion or prejudice, whether it found its expression in State legislation or in mob violence, or, as Mr. Miller's preamble calls it, "disorders in certain localities." With this in view, an enormous expansion was given to the idea of United States citizenship, and Republican orators in and out of Congress never wearied in descanting on the completeness of the protection it afforded, even in its simple and non-enfranchised form, against the bigotry or fanaticism of particular districts.

Now see what is happening in Washington. The Republicans are actually supporting a measure which is treating race as a disqualification not only for the franchise, but even for peaceful and industrious residence in the country. The bill does not exclude Chinamen because they are ignorant, or poor, or lazy, or turbulent, but because they are Mongolians. Under it, nothing that a Chinese laborer can do can procure him permission to enter the country so long as he remains a Chinaman. Moreover, it is not alleged in the bill, or in the preamble, that the Chinese are a law-breaking or vicious people, or that their presence is dangerous to the public health or welfare. It is beyond question that they are no more objectionable as laborers than the negroes were at the South after the war, and are much more highly civilized. Moreover, their presence does not trouble the whole Union. There is no prejudice against them among the great bulk of the American people. The sole cause of the legislation against them is the prejudice of the 1,009,390 whites of the Pacific coast, or of about one-fiftieth of the American people. Nor does Congress ask whether this local prejudice is reasonable, as it did in dealing with the Southern Black Codes and with the operations of the Ku-Klux Klan. It assumes that it is reasonable, and prepares legislation of the most sweeping kind for its gratification. In other words, it practically surrenders to the States the right of deciding that race, color, or previous condition may make a man unfit to be either an American citizen or voter.

It will be said by many, however, as Mr. Edmunds says substantially, that the bill, being levelled solely against foreigners, does not conflict with the ground taken by the Republican party for the protection of the Southern blacks, who, whatever their mental or moral defects, were natives of the country, and actually resident in the country; and that every country must have the right of deciding whether foreigners may take up their abode in it. Unfortunately for this argument, however, this bill is not directed against all foreigners. If it were, it would be, however illiberal, following an example set by many countries, and notably by China herself. But it is only directed against a particular class of foreigners. It excludes Chinamen, not because they are foreigners, but because they are Chinamen. It is therefore legislation against a particular race, and for this there is no example among civilized nations in recent days, except the legislation against the Jews, which still disgraces the statute-book of Russia, and until very recently disgraced the statute-book of several other Christian nations. In passing this bill, therefore, we are not keeping America for the Americans, we are discriminating against a whole category of men on account of race or color. We are thus cutting from under our feet the ground on which we forced the Fifteenth Amendment on the adoption of the South. For if we once admit that race or color can in American polity disqualify any man, native or foreign, for any privilege we have to bestow, we admit that the enfranchisement of the negro was justifiable on grounds of expediency only, and thus, as Mr. George truly says, relegate it to the character of an experiment which has not yet been fully tried, which may fail, and may have to be abandoned.

The speech of Mr. Jones, of Nevada, in the Senate, was as fitting a preliminary to the passage of the bill as could well be imagined. He boldly took the ground that if the protectionist policy is a good one, it should provide protection for the laborer as well as for the capitalist; and that for this purpose it is not enough to shut out the foreign manufacturer's goods. Foreign "pauper labor" must be shut out too, and for this reason alone the exclusion of the Chinese is called for, and the more skilful, ingenious, and industrious they are, the more it is called for. In this argument he met those who oppose the exclusion of the Chinese because of their industry and intelligence. He then met those who oppose it because it is a discrimination against a particular race, by adopting and expanding the argument of Mr. George of Mississippi, that there is a serious difference in the social and political value of different races, and that inferior races ought to be shut out; that the presence of the blacks at the South is a misfortune; that bestowing the suffrage on them has not solved the problem of their relation to the whites; that if they were not in the country already they ought never to be admitted; and that if let alone by the whites they would relapse into their old barbarism. The whole discourse was enough to make Thaddeus Stevens or Joshua R. Giddings turn in his grave. Strange to say, however, it was very effective. The bill was passed by 29 to 15—five Republicans being among the majority.

The bill derives additional spice as a novelty from the fact that though nominally passed in execution of the late treaty with China, it is really a violation of it. The treaty provides for the regulation of immigration, while this virtually prohibits it altogether, by shutting out the class of laborers which contains almost all the immigration which there is, or is likely to be. The Chinese travellers, and students, and scientific men, and merchants who are likely to come to this country in any one year will probably not fill a small omnibus. This feature of the bill will probably highly commend it to the hard-working and painstaking Bill Nyes of the Pacific coast, for they have always enjoyed cheating a Chinaman even more than robbing him.

Another feature in the bill which will cause it to be highly relished by the humorous cynics of both hemispheres is that it proclaims the deliberate adoption, by the newest nation of the West, of the old policy which the Chinese kept up for thousands of years, but were compelled to abandon as barbarous by European guns, backed up by the American example and persuasion. The Chinese are a serious people, and not given to boisterous mirth; but there must be more or less laughter, even in the Board of Foreign Affairs at Pekin, when they hear that the old and much-reviled Chinese plan has been adopted by the American republic, and that Mr. Jones had successfully urged on the American Senate the trial of the Chinese mode of preserving that homogeneity of race to which he ascribed the permanence of Chinese institutions.

To crown all, the bill introduces the passport system into America, after it has been abandoned by some of the leading nations of Europe. Under it every Chinaman of any class who comes into this country is to have a passport, with the usual physical description, or "signalement," as the French police call it, and an account of his occupation and place of abode, and it is to be *viséd* in China by the United States agents. In addition to this, all Chinese travellers or residents are to be registered at our custom-houses, and the registry is again to contain the "signalement" of each person. In fact, considering what the attitude of the United States toward foreigners has been ever since the foundation of the Government, and considering how deep the faith of the American people has been in the power of their institutions to withstand even the vice and ignorance of foreigners, and convert

them into good citizens, this legislation must be considered one of the most extraordinary pieces of tergiversation in political history. It is the more extraordinary because the more one examines the Chinese problem on the Pacific coast, the more satisfied one becomes that the whole anti-Chinese movement, in so far as it is political, is the result of the judicial decision which denied to Chinamen the quality of being "free white persons" for purposes of naturalization under the United States statute, although this statute expressly admits to citizenship the savages of the African continent as well as our native blacks. If even 3,000 Chinamen had been naturalized in California, and had been voters during the past ten years, it is all but certain that neither the Democratic nor the Republican politicians would have discovered the horrors of Chinese immigration, or have ventured to plant passports, and alien registries, and disqualification by race and color on American soil. In fact, they would probably be by this time as anxious to deny all hostility to Chinamen as they are now to conceal that they ever favored negro slavery, or belonged to a Know-Nothing lodge.

THE COMMERCIAL AND FINANCIAL SITUATION.

Foreign consumers show but little disposition to take our breadstuffs and provisions at present prices. There is a general holding off in all the foreign markets. There has been so much said about "speculation" buoying up the prices of all these commodities, that in all the European consuming markets there is a belief that there must some time soon come a general breaking down of prices in this country. This has been the prevailing impression all winter, and yet prices have been maintained with a firmness which has surprised a good many, who are now beginning to modify somewhat their views about the extent to which prices may be too high to find a market.

The supply of grain—wheat and corn—in the entire country, available for export, is less than last year, and the same may be said of provisions and lard. Large stocks of all these commodities are concentrated at the great representative point of Chicago, and are held there by the capital of speculators invested in them, thus making the appearance of excessive supplies. The demand for all these has also been less than last year, and the movement of the commodities has been unusually light. The mild winter has been favorable to preparations for next year's crop of spring wheat in the Northwest, and everything is favorable to a good one. And yet it is possible that the diminished supply of corn in the West at large and the diminished supply of hogs, together with increased demands from the South for all sorts of food stuffs, may show that the present prices of pork, lard, corn, and even wheat are not too high, and that Europe will eventually take the surplus at something like present prices.

Cotton is the greatest item in the adjustment of our foreign balance, and upon the particulars of the supply and export of this will depend to a greater extent than on any other one item the movements of gold and the consequent financial situation in this country during the current year. The speculators and statisticians have been operating upon the assumption that the crop now coming to market will, by September 1, at the end of the cotton year, show a shortage of 1,100,000 bales—some say 1,200,000 bales—as compared with the previous year. Upon the same basis of prices this would show a shortage of between $55,000,000 and $60,000,000 in our stock of exportable products as compared with the previous year. Of course, a large part of this will be made up by higher prices for what we do export; and this equalizing effect will be felt more and more toward the latter end of the cotton year if it become apparent that the shortage is as much as was estimated, and if, as is possible, it also become apparent that the present floods in the cotton regions of the Mississippi Valley have made another important shortage in the next crop. But, however these features may turn out, the present visible supply of cotton available for export is about 100,000 bales greater than last year, with larger stocks on hand in Europe. Thus far, the legitimate demand for consumption in England does not indicate a disposition to buy largely of American cotton at present prices; but systematic cotton speculators, who make the elaborate published cotton statistics a study, and base their operations on their opinions derived from them, are not only maintaining prices in this market nearly a cent above Liverpool, but are shipping cotton there notwithstanding the advance prices, and hoping to get out with a profit by the anticipated rise in foreign markets. It is proper to add that some of the most careful and best informed operators declare they do not see how this result can be expected; nevertheless, it is largely to this kind of shipments that the increased supply of commercial bills on the market within the past week has been due.

To the extent that America is the world's greatest source of supply for food-stuffs and cotton, there has been much reason for higher prices everywhere. Last year's crops showed an important diminution in almost every item. The severity of last winter caused enormous losses of live stock in the far West, which are just now beginning to be made apparent in the great decrease of this winter's pork-packing in the West. The falling off in the winter wheat and corn crops, and the very important one in the cotton crop of last summer, are all sufficient reasons for higher prices for all articles of food and cotton than last year. But it is not only on account of these higher prices that the foreign markets have not taken our surplus this year. The policy of foreign governments in discouraging the great dependence of their respective countries upon America for these supplies had an effect in the same direction. During the three years up to last fall we had, by the great export of all these commodities at much lower prices than now, drawn about $220,000,000 of gold from and revolutionized our commercial relations with Europe. It was partly to prevent this further outflow of gold that such opposition was made on the Continent to the importation of American products.

This opposition on the Continent, followed by the advance in the rates of discount at the great banks of England, France, and Germany, checked our exports, and caused the reëxportation from this country since January 1 of $11,291,340 of the specie we had gained from Europe in the last three years. This reaction continues to some extent, but all the latter part of the week foreign exchange has been vibrating about the point of 4.89½, below which the export and insurance of gold are not justified. The immediate prospect, therefore, is not unfavorable to a change of all the conditions in our favor. It may be delayed by the continued sluggishness of the foreign demand for a time; but, as foreign consumers begin to realize that there has really been an important decrease in every item of American products, and consider the possibilities of European war, the conditions may possibly change.

In our more immediate financial affairs, also, there has been a great change for the better. The inflation has been taken out of American stocks; the too sanguine views of projectors of great improvements have been reduced to a safer and, it is believed, a solid basis. The average of all non-dividend-paying stocks are now selling at about sixty per cent. of the prices which they commanded last May, and even the dividend-payers are far below their value as compared with the rates obtainable for the large supplies of money seeking investment. In brief, therefore, it may be said that, unless some new disaster should occur, we are at the bottom of the long decline of the last nine months, and that, though the reaction may be delayed a little, yet it will come this spring with a more active movement of our present surplus products at somewhere near present prices, and be followed up by the prospect of better crops. Meanwhile we may reasonably expect nearly 1,000,000 immigrants during the current year, with all their addition of money and labor to the resources of the country.

NON-PARTISAN JURIES.

From the time of Lord Mansfield to the present day all legal reformers have admitted that the jury system has its imperfections. Juries are popular bodies, and as such apt to be swayed by prejudice and passion, and the influence of prejudice and passion is just what all who are interested in the administration of justice feel that it ought to be absolutely free from. The defenders of the jury system, however, have always maintained that while some other mode of trial may be better in civil suits, juries serve, in all cases involving political questions, a useful purpose, as judges are apt in such cases to be themselves influenced by anti-popular sentiment, and in order to protect life and liberty and popular rights against judicial tyranny, a tribunal drawn fresh from the people is needed.

For this reason, it was generally felt at the close of the war, that for the preservation in the South of the political and civil rights of the negro we must rely very much on the jury system. With the negroes admitted to sit on juries, and "ex-rebels" disqualified, fair trials securing the "results of the war" would be possible. There was always a good deal of dispute as to how the Southern jury system

worked, however, but the general advance in prosperity and quiet in that part of the country since the end of the war seemed to shew that the changes introduced did not lead to any evils, and that the business of the United States courts in the South was transacted in such a way as to give a new proof of the value of what used to be known as the "palladium" of the liberties of the race.

In 1879, however, some legal reformers in Congress hit upon a new plan for the improvement of Southern juries, which looks as if it had been suggested by one of the great discoveries in the science of municipal government made in this city. It may have been the triumphant success of our "non-partisan" Park and Police boards, composed of an equal number of members of the two great political parties, which led these reformers to inquire why the same principle could not be extended to juries. Why indeed? There is far less apparent connection between parks, the police, and politics than there is between juries and politics in the South. To require all juries to be made up of six Republicans and six Democrats was, from a legal point of view, however, an innovation, and, like all great reforms, was not an easy measure to carry through on its merits without a good deal of discussion and opposition. To avoid this difficulty the reformers resorted to a plan which generally works like a charm in legislative matters. They put their measure into the form of a "rider" to the Judicial Appropriation Bill, and put before Congress the alternative of making the jury system "non-partisan" or bringing the judicial machinery of the Government to a standstill.

The "rider" which, against many idle protests from General Garfield and others, became law, provides that all jurors in United States courts "shall be publicly drawn from a box containing . . . the names of not less than 300 persons, . . . which names shall have been placed therein by the clerk of such court and a commissioner to be appointed by the judge thereof, which commissioner shall be a citizen of good standing, residing in the district in which such court is held, and *a well-known member of the principal political party in the district in which the court is held opposing that to which the clerk may belong*, the clerk and said commissioner each to place one name in said box alternately, without reference to party affiliations, until the whole number required shall be placed therein."

The law has now been in force for two years, and, strange to say, according to testimony collected in the South, non-partisan as it is, the manner in which it works is only satisfactory to one political party—the Democrats At the first blush, it would seem impossible that any one could object to a jury system which made it almost certain that no jury could be drawn which would be composed exclusively of members of either political party. But the Republicans in the South are by no means happy over it. They say, for instance, that at the last term of Judge Settle's court there were several cases of offences against the election laws, the testimony in which, according to the judge, was so conclusive that the jury ought to have brought in verdicts of guilty without leaving the jury-box; instead of which they disagreed in every case. General Duskin, United States District Attorney in Alabama, says that in a recent case the election officials in a certain district were indicted for a violation of the election laws—their returns failing to show a single Republican vote cast. Twelve witnesses on the trial testified to seeing Republican ballots deposited. The jury disagreed. According to a Republican lawyer from another Southern State, "the 300 men selected are chosen from bitter partisans of the opposing parties. The clerk of the court selects 150 Republicans, and the commissioner chooses 150 Democrats; and every case is decided, not according to the testimony, but according to the political predilections of jurors. In other words, it is not decided at all, but ends in a disagreement of the jury."

Another Republican lawyer ironically says:

"It works splendidly. . . . Every trial ends in a disagreement of the jury. No attention is paid to the testimony. The Republican jurors vote to convict and the Democratic jurors acquit the offenders. To show you how perfectly the jurors understand their duties, I will tell you a true story. Last year it became known that certain enterprising Democrats had been indicted in our State for violating the election laws. As the time for the trials drew near, appeals were made in the Democratic newspapers and elsewhere for contributions of money to pay the cost of defending the criminals. Assessments were also levied on the members of the Democratic clubs to raise funds for this purpose. It happened that a member of one of these clubs, who had been drawn as a juror, was asked to pay his assessment of one dollar. 'Well,' said he, 'I do not think I ought to pay that money. I am on the jury, you know, and I expect to do my share there in acquitting these persons.' I understand that this plea was considered a good one."

This looks as if the non-partisan system cannot be relied upon to solve the jury problem in the South. The reformers who got the law through Congress seem to have overlooked the fact that a perfect non-partisan scheme ought to produce results satisfactory to both political parties, and that Republicans can hardly be expected to regard as non-partisan a jury system which satisfies only Democrats.

The pretence of trying to get "non-partisan" bodies of all kinds by making them up in equal parts of bitterly opposed partisans is getting to be altogether too transparent for use, and its application to the jury system by means of a forced "rider" to an appropriation bill, with the comical but inevitable results of producing, in cases growing out of "politics," not non-partisan verdicts, but disagreements of the jury, seems like a bit of legislative *bouffe*.

GOVERNMENT ABSORPTION OF PRUSSIAN RAILWAYS.

BERLIN, February 26.

THE ownership of the German railroads by the Government, and not by private companies, will be decided in a few weeks. The committee of the House of the Prussian Landtag agrees with the Government in the choice and price of the roads to be purchased, and the formal adoption of this resolution will shortly, as a matter of course, be voted by the majority. The present Minister of Public Works, Herr Maybach, is able and competent in his line. As he has no political aspirations of his own, and in all his transactions is led by his desire to please his chief, Bismarck, he has in all his doings the powerful arm of the Chancellor behind him, and achieves what none of his predecessors would have dared to urge, and what even Bismarck could not have accomplished without the energetic assistance of an ambitious Minister like Herr Maybach.

You will remember that in 1876 Prince Bismarck proposed to buy all German private roads for the Empire. At that time, when he had not yet surrendered himself to the protectionists and agrarians, the measure was looked upon more as a political than an economical plan. Even a great many of the present political adversaries of the Chancellor agreed with him, that the most practical way to reduce the petty princes to utter insignificance, beginning with Bavaria and ending with Schwarzburg, would be to divest the railroad monopoly of their sovereign rights. "Let us make those fellows," Bismarck often said, "civil princes. Since they have lost the chief command of their troops, the sharpest sting has been cut off. Now leave them the right to nominate parsons and sextons, and they will be out of harm's way, while the perpetual unity of Germany will be accomplished." These petty princes, however, instinctively felt the danger threatening them, and persistently refused to give up the last real remnant of their sovereignty. Thereupon it was resolved to buy all Prussian private railroads for the Prussian Government, which within four years carried out its programme to the letter. In 1879 it owned 6,200 kilometres (one English mile=1.61 km.), and acquired from the private companies 5,002, making in all 11,202 kilometres. Besides, it has under its management 2,350 kilometres of private roads and 1,231 belonging to Alsace-Lorraine. To the present session of the Landtag it proposes to buy 3,284 more, when all in all it will have 18,057 out of 34,034 kilometres, which constitute the present entire length of all German railroads, state and private. Among them are Bavaria, with 4,156 kilometres; Saxony, with 1,980; Würtemberg, with 1,533; Baden, with 1,314; Hesse, with 175; Oldenburg, with 290; and various other small states who hold in common 146, making in all 9,588 kilometres. The proportion of all governmental railroads to private ones thus stands, or rather will stand, at 27,645 to 6,385, and it does not require great sagacity to predict that in a few years the private roads will have become an institution of the past. During the last year the income realized by Prussia from her railroad investments was 5¼ per cent., while in 1879-80 she had only made 4.87 per cent.

I am not yet able to judge definitely of the efficacy of the measure. Although the new system will save much money, and will be carried out with that exactness and honesty which are and have always been characteristic features of the Prussian civil officer, there are three main objections which, in my opinion, weigh heavily against state ownership.

First—A very large amount of stock, worth several thousands of millions of marks, will be withdrawn from the market, and small as well as large capitalists will have to invest their surplus in other shares or bonds. There is, perhaps, no civilized people which, from an economic point of view, is less educated and more given to fallacies than the great mass of Germans. The more interest is promised the more eager they are to invest in an enterprise of which they often know nothing but the name, and which on account of the height of its percentage cannot be safe. To give you an instance: After millions of dollars had been made in this country by speculating in United States bonds, hundreds of millions were lost here by speculating in unsafe American railroad bonds. I know a gentleman who in other respects is not at

all stupid, but who sold his good Government bonds in order to buy the first-mortgage bonds of a certain Western railway, which he was finally glad to sell for a trifle. To my warning he replied that they seemed to be just as good as United States bonds, and that they looked just like them. What is still worse, in the great majority of cases, the average German invests all his money in one security, or rather insecurity, and is induced to do so by the greedy desire of gaining the greatest possible profit at one stroke. The other day a great scholar of this city, who was a gentleman of large means, had to sell his house and garden in the best part of Berlin, because he had lost his whole fortune by buying Rumanian railroad bonds at high rates and selling them at the lowest. He might just as well have speculated in Mississippi or Arkansas bonds. All these shortcomings, it is true, will be overcome by and by; but at present the embarrassment created by the commutation of hundreds of millions of railroad stock into Prussian consols, is too sudden, and will lead hosts of capitalists into bad investments. The Government's rate of interest is four per cent., and in the eyes of German investors too low to deserve much attention. From a financial point of view Germany, therefore, will lose much, which could have been avoided if the new system had been introduced gradually and not within two short years.

Another objection which I have to make to the exclusive state ownership of railroads in this country is much more lasting. The tendency of Prince Bismarck and of his subordinates is in the direction of state omnipotence, which of late has even been developed into state socialism. Thus the railroads, too, will be managed with a single eye to Government influence and supremacy. Hitherto we have had several hundred thousand railroad officers, employees, and workingmen who were never interfered with in their political views, who could vote as they pleased, and entertain any opinion which did not come into collision with the criminal law. We have, however, already had some, and shall every day have more, experience of the influence which the abolition of private railroads will exercise on our political life. Recalling the royal rescript of January 4, you will readily understand that the railroad men will form no exception to the general rule which is imposed upon all royal officers. Henceforth it will be advisable for a railroad employee not to vote otherwise than in accordance with the political opinions of his chief. Our Ministers and their assistants consider themselves the owners of the Government machine, and run it in their interest or interpret their duties as understood by the Chancellor. Railroad officers, post-office and telegraph clerks no longer dare to petition, in their own names, the Reichstag or Landtag, because they are threatened with punishment if they do so. The other day, when a Deputy in the Landtag complained that the time-tables of the railroads had not been published in the Opposition paper, although it enjoyed the largest circulation in his province, Herr Maybach's subordinate, a very green "Geheimer Rath," replied that the Minister could do as he pleased, just as the Deputy himself was at liberty to choose a better tailor, if the first did not suit him, or to order goods from a merchant who had fewer customers than another. This boyish talk was sharply reprimanded by the Opposition, but to no purpose, as the higher Prussian civil officers consider themselves infallible. The tone of our civil service has been much lowered by the requirements which the Government of late has imposed upon its employees. Thus they are losing more and more that self-esteem and pride of independence which have hitherto been the noblest characteristics of their public life, and this loss is the severest of all.

Last, though not least, the new system will exercise a decisive influence upon the management of the Prussian finances, and on our constitutional development. As the Government has rejected the material guarantees demanded by the House for the purpose of preserving its right of voting the budget, there is great danger that the Minister of Public Works will make that right illusory. He can create sunshine and rain by raising or reducing the freight tariff, thus controlling the whole economical life of the nation, and becoming much more influential than the Secretary of the Treasury. When the present bill is carried the whole railroad property of the state will amount to about 6,000,000,000 of marks, or about $1,500,000,000.

On the 20th instant a steamship company celebrated the twenty-fifth anniversary of its existence—a fact which, because of the company's close relations to your country, deserves to be mentioned in your paper. I refer to the North German Lloyd, established in 1857 in Bremen, with two ships, running monthly between that port and New York. Owing to the energy of its president, Mr. H. H. Meier—member of the Reichstag for Bremen—to excellent captains, to good management, and to the efficiency of very able agents, like Messrs. Oelrichs & Co., of your city, it has gained strength from day to day, and, with its twenty-three splendid large steamers, is now competing with the best lines crossing the ocean. What we free-traders give it most credit for is, that even in times of bad luck the Lloyd has disdainfully refused the subsidies freely offered it by the Government, and that it owes its noble position solely to its own exertions. It is now as firmly established as can be. On account of a heavy and daily increasing emigration, the present times are good for all shipping houses, but especially for companies which, like the Lloyd, can look back with satisfaction upon a glorious history.

What enormous proportions the German emigration will assume the coming season you may conclude from a late advertisement of the Lloyd. In the next four months, from March 1 to June 30, it will send out from Bremen to New York and Baltimore not less than 67 steamers—namely, 18 in March, 17 in April, and 16 each in May and June—that is, more than one large ship every two days. Suppose that each of them takes out only 600 steerage passengers on the average—in my opinion, the number will amount to at least 750 heads per vessel—there will be more than 40,000 passengers from one German port within four months. And what is still more interesting is the fact that the passage money for the greater part of the emigrants has been sent over by friends and relatives from the United States to Germany, or that a ticket has been bought by them, which has been sent over here. A similar lively business is done in Hamburg; and apart from the smaller ports of Havre, Antwerp, Rotterdam, and Liverpool (the latter as far as German emigration is concerned), the German emigration alone for 1882 may be set down at 250,000 heads. Our protectionists are quite alarmed. Who will work for us, who will eat our breadstuffs, they cry, if small farmers, servants, and mechanics go to America? To help themselves, they insist upon strong emigration laws; but it will be of no use. They may hurt Bremen and Hamburg for a short time, but they will further the shipping interest of Rotterdam, Antwerp, Havre, and Liverpool. This mighty migration cannot be stopped by precautionary measures of the police, the factors creating it being too powerful. † † †

Correspondence.

DIFFERENTIAL RAILROAD RATES.

To the Editor of The Nation:

Sir: Whatever may be the merits of the differential-rate question now being discussed before the Thurman-Cooley-Washburn Commission, there is one theory advanced by representatives of the New York merchants that ought to be refuted at once—namely, that rates should be based upon the cost of service.

The cost of service (or production) will have the same influence upon the price of transportation by rail that cost of service (or production) has upon the price of iron or other commodities, and no more. One iron mill may have advantages which enable it to produce iron at less cost than another, and the cost at which it can produce will have some influence upon the *market price* of iron; but, to say that it must charge less in the market for its product than the market price, or than the mill which makes iron under greater disadvantages, would be absurd. In the market all must *charge* alike, and the mill possessing special facilities or advantages will make the most money.

The same law applies to the price of transportation by rail, and it seems singular that at this late day any business man should think otherwise. It was an axiom among railroads twenty-five years ago, and is just as true now, that the short line between two common points should make the rates, *and other lines should conform.* This was upon the theory that the short line would generally be the one *able* to do business at the lowest rates and live. What was meant was that the line between common points which could produce transportation at the smallest cost should fix the rates, and the other lines should conform. It has never been claimed that the more costly lines should *charge more.* Such a rule would drive all the roads but one between any two common points out of the market, because the business would all seek the road which could produce transportation cheapest and survive.

The argument is not only in itself unsound, but it is fatal to New York. It is argued that cost of service must settle the differential-rate question, and that the New York roads can do business enough cheaper than the other lines, per mile, owing to low grades, etc., to warrant making the New York rates the same as the Philadelphia and Baltimore and Norfolk rates. If it is true that the New York Central can carry freight to *New York* at as small *cost* as the Pennsylvania road can carry it to *Philadelphia,* then it follows, as New York is ninety miles beyond Philadelphia, that it costs the Pennsylvania road more to carry freight to New York than it costs the New York Central, and, adopting the cost-of-service theory, the Pennsylvania road should charge more to and from New York than the New York Central charges, while charging the same to and from *Philadelphia* as the New York Central charges to and from *New York.* If this is done, the New York merchants will all use the New York Central to the exclusion of other lines, and the Pennsylvania and Baltimore & Ohio will be obliged to abandon that field.

The fallacy of the cost-of-service theory is obvious enough on reflection, and it is to be hoped that the distinguished Commissioners will not be influenced by it. If it is true that rates between the West and all the seaboard cities should be alike, it is not because the cost of service is the same to and from all, but because the seaboard cities are all practically one market, so far as the world is concerned, and rates between the

West *and the Atlantic seaboard market* should be the same by all routes—just as rates between the West and New York city have always been, and must always be, made the same by all routes, without regard to what it costs the railroads. A Railroad Man.

Chicago, March 10, 1882.

PUBLICITY OF RAILROAD ACCOUNTS AND MANAGEMENT.

To the Editor of The Nation:

Sir: The real difficulty met in solving the problems which are connected with the regulation of railroad tariffs and of railroad management is the impossibility of getting a reliable foundation of facts relating to the business done and to the character and animus of those who manage that business. From the nature of their business, the railroad managers are public men in the same sense that the President and the Secretary of the Treasury are public men, and yet are without the curbs or restraints which are felt by those high officials. People generally think that railroad managers, as officials, are practically irresponsible; as men, they are unknown. They have business dealings of vital importance with thousands of people in every town and village and farm in a vast extent of country. These people are, from their knowledge of themselves and of human nature, naturally suspicious of the honesty and the rectitude of intention of any set of men who act in secret and have no recognized laws to guide them.

A knowledge of the facts would probably correct this suspicious feeling. This is generally admitted; the doubt is how to obtain this knowledge. Facts as to the cost and receipts of business could be obtained by compelling a general practice of keeping and publishing railroad accounts on a plan similar to that adopted by Mr. Fink, when on the Louisville & Nashville R.R.—a plan not only complete, but admirable in the analytical ability which it shows.

Facts as to the style of management and the character of the managers could be obtained by allowing a public examination of all the proceedings of the Board of Directors (which relate to business, as distinguished from those which relate to patronage), and of all the official orders and books of the managers relating to general and special rates. Such examination could be delayed for six months, so that premature publicity could not interfere with current business; that is, all proceedings for the six months ending, say on December 31, 1881, would be open for examination on July 1, 1882, to any person sufficiently interested to spare the time.

By this method the managers would be made directly liable to public opinion. It would save the expense of railroad commissioners; it would avoid the delay of their cumbrous machinery; it would not be affected by their individual prejudices, and, at the same time, would make the railroad managers amenable to law.

Would not much reckless speculation and unjust discrimination be prevented in public business if every railroad president and manager was sure that every act of his would be open to the same scrutiny that every act of the President and of the executive officers of the Government is at the call of the House or of the Senate? To be sure, the question of rates to rival seaports is a different and more difficult problem, not to be affected, it would seem, by any legal regulations. G. M.

Syracuse, March 10, 1882.

VOGT'S VACCINATION RATIOS.

To the Editor of The Nation:

Sir: In reading the article on "The Vaccination Question" in No. 871 of the *Nation*, the appearance of the figures prompted my curiosity to develop the ratios. I was amused to find that the figures were almost exactly equivalent, the fifth column (the "correct" one) showing the *number* of cases in 10,000, the fourth column (Vogt's) giving the *proportion* of cases—though why the number 10,000 is mentioned by Vogt does not appear from this citation (87.6 : 219.6 = 20.2 : 50.6 = 2.6 : 6.6 [6.5]). I write from the purely disinterested motive of relieving Vogt's name of the undeserved charge of "ignorance" and "mendacity"—undeserved in this instance—and not at all in opposition to the writer. I have already committed myself irretrievably to the side of the latter, as my arm shows.—Respectfully, * * *

New York City, March 9, 1882.

[The precise point of this criticism is not understood. According to Vogt's table, 30.37 deaths in a population of 1,383 give 87.6 deaths per 10,000, and 5.88 deaths in a population of 1,163 give 20.2 deaths per 10,000. This is not true. 30.37 : 1383 is not = 87.6 : 10,000, but = 219.6 : 10,000; and 5.88 : 1163 = 50.6 : 10,000, and not 20.2 : 10,000. It is true that the *ratio of error* is the same, giving almost exactly 2-5 of the true ratio in each case, so that it would seem as if Vogt had calculated the true ratios, and, finding that they did not suit his views, had divided each of them by 2.5, as the easiest and quickest way of making his table.

The worst of it is that he then proceeds to use these false ratios in a table on the following page, to prove that the yearly ratio of mortality from smallpox before the days of Jenner was less than it has been since Jenner, whereas the true ratios would have shown precisely the reverse. This table is otherwise unfair, and it was not thought worth while to quote it and point out the errors, since to do this would take up too much space. A part of it is here given, to show the effect of the false ratios above explained.

Yearly Mortality from Smallpox in Cities per 10,000 Living.

Ages.	Since Jenner.				Before Jenner.	
	Paris.*	Vienna.†	Stockholm.‡	Chemnitz.§	Geneva. Vogt's ratio.	Geneva. True ratio.
0–5 years.	32	64	66	124	88	219.6
5–10 years.	10	8	5	8	20.2	50.6

* Yearly mean, 1828–1836. ‡ Yearly mean, 1864–1866.
† Yearly mean, 1863–1868. § Yearly mean, 1871–1872.

It is hardly necessary to point out to the statistician the small value of the comparison of ratios derived from two or three years' experience only, selected presumably at the time of an epidemic, as is the case for Chemnitz and Stockholm in the above table, with ratios derived from the experience of 180 years, as is the case with the Geneva figures; and when these last ratios are found to be systematically falsified in a constant proportion, it is thought that the alternative of ignorance *or* mendacity is, on the whole, rather a mild and friendly mode of characterization.—Ed. Nation.]

Notes.

Miss C. M. Hewins, Librarian of the Hartford Library Association, Hartford, Conn., will gladly receive from teachers and librarians statements of their efforts to encourage a love for good reading in boys and girls, for a report at the Conference of the American Library Association at Cincinnati in May.

J. B. Lippincott & Co. announce a new popular edition of the works of William H. Prescott, in fifteen volumes, from the plates of that edited by Mr. John Foster Kirk. They have also in press a translation, by Miss Augusta McC. Wright, of Gautier's 'Romance of a Mummy'; and a 'Smaller History of the United States,' by Josiah W. Leeds.

Gautier's 'One of Cleopatra's Nights, and Other Fantastic Romances,' translated for the first time by Mr. Hearn, of the New Orleans *Times-Democrat*, will be published by R. Worthington, as well as a new novel, 'The Gipsy Queen,' by Hugh de Normand.

A. C. Armstrong & Son will begin publication immediately of "The Clerical Library," or helps to sermonizing, as the series might be called. Three of the proposed twelve volumes, each of which will be complete, are entitled 'Three Hundred Outlines of Sermons on the New Testament,' and again on the Old Testament, and 'Outline Sermons to Children, with Numerous Anecdotes.'

G. P. Putnam's Sons add to their announcements 'The Sunday Question,' by the Rev. Leonard W. Bacon, of Norwich, Conn., who "is said to treat the subject from a liberal point of view," and may be trusted to make it interesting; 'The Defence of the Bride, and Other Poems,' by Anna Catherine Green; 'Lady Beauty,' by Allan Muir, in the Trans-Atlantic Series of novels; and, in the New Plutarch Series, 'Victor Emmanuel,' by Edward Dicey.

D. Appleton & Co. will shortly publish Huxley's 'Science and Culture, and Other Essays'; Tyndall's 'Essays on the Floating Matter of the Air, in relation to Putrefaction and Infection'; 'The Brain and its Function,' by Dr. J. Luys; 'Myth and Science,' by Tito Vignoli; and 'Plantation Songs and Ballads,' by Joel Chandler Harris, author of 'Uncle Remus.'

Chas. Scribner's Sons have nearly ready 'Molinos the Quietist,' by John Bigelow; and 'Outlines of Primitive Belief among the Indo-European Races,' by Charles Francis Keary, of the British Museum.

Macmillan & Co., whose removal on May 1 from Bond Street to No. 112 Fourth Avenue obeys the up-town law of progress, announce for immediate publication Mr. Hamerton's much-delayed important work on 'The Graphic Arts.' They have also ready the cheap edition of Mr. Shorthouse's new romance, 'John Inglesant,' in their series of novels.

E. P. Dutton & Co. will be the American publishers of 'The Confessions of a Medium,' and of a popular English work, 'Outlines for the Little Ones to Color.'

To their cheap and yet handsome library edition of Canon Rawlinson's 'Five Great Monarchies of the Eastern World' Dodd, Mead & Co. have now added his 'Sixth Oriental Monarchy' (Parthia), first published some nine years ago.

Mr. Blaine's Eulogy on President Garfield has been printed in a neat volume, with a steel portrait, by J. R. Osgood & Co.

Some well-chosen selections from Longfellow's poems, largely narrative, initiate Houghton, Mifflin & Co.'s "American Classics for Schools." The several pieces are annotated. We should have included in our choice "The Building of the Ship" and "The Arsenal at Springfield."

"Love's Labour's Lost" is the newest issue in Rolfe's expurgated edition of Shakspere (Harpers), and "King Henry V." in that of Mr. Aldis Wright's 'Select Plays of Shakspere' (Macmillan).

No. 4, completing vol. v., of the *Pennsylvania Magazine of History and Biography*, contains a number of still unfinished articles, the most interesting of which are Mr. Townsend Ward's "Germantown Road and its Associations," increasingly rich in etched illustrations, and the "Journal of Captain John Montrésor," describing Howe's expedition up the Chesapeake and the consequent battle of Brandywine.

Those who have read Mrs. Oliphant's 'Beleaguered City' will be interested to be told that the phenomenon of a cloud remaining stationary many weeks over a city actually occurred at Paris from the 4th of January to the 26th, in 1882, as described in *Nature* for February 9. "Neither sun, nor stars, nor moon were visible for an instant during that lengthened period."

The London *Daily News* of February 18 responds to the exposure made in the *Nation* and the *Critic* of Mr. Thomas Hardy's plagiarism from a well-forgotten American book and otherwise, by saying in effect that "it was a very little one." The *Academy*, more discreetly, reprints the evidence "without comment."

The latter journal announces an interesting work, 'Folk-Etymology: a Dictionary of Words corrupted in Form or Meaning by False Derivation or Mistaken Analogy,' by the Rev. A. Smythe Palmer, author of 'Leaves from a Word-Hunter's Note-Book.'

The *Athenæum* reports that the surviving daughter of Thomas Bewick, who is considerably older than the century, has carried into effect the bequest resolved upon by herself and sister some years ago, and made over to the British Museum their "matchless collection of impressions from the blocks and other works of their father and uncle and brother, as well as some of the admirable drawings of the first named." These last number 165, and are mounted on forty sheets, "being original studies of the most exquisite quality, chiefly in delicate and brilliant water-colors, made for the great book on [British] birds." Might not some art journal be permitted to reproduce specimens of them in chromolithography? Or, as a crucial test of the progress of modern engraving, perhaps the *Century* would undertake to procure photographs of one of these, put them upon the block and assign them to several engravers, and print the results in comparison with Bewick's own cut from the same design.

"A Corner of the Paris Quays" is the subject of an etching which forms the chief embellishment of the February number of *Le Livre*. The *flèche* of the Sainte-Chapelle, let us guess, is the spire which looms up in the middle distance. The gaping wooden boxes of the dealer in old books are arrayed on the stone balustrade, and half a dozen unprosperous-looking bibliophiles are searching in them for treasures of first editions. Near by, under a tree, sits the proprietor, whose turned back implies absolute confidence in the honor of his patrons.

A 'Sprach-Atlas' of Northern and Middle Germany, prepared by Dr. G. Wenker, is in course of publication by Karl J. Trübner, Strassburg. It promises to be a highly important work, descending to such minutiæ as the limits of local peculiarities like initial *z* (equivalent *t*, or *vice versa*), *p* and *pf*, etc. It will not be completed under five years.

—In the present deluge of little books on large subjects, we are glad to find one so good as Mr. Mahaffy's 'Old Greek Education,' recently reprinted, in the "Education Library," by Harper & Brothers. It has, to be sure, some minor faults, such as might be anticipated by readers of the author's earlier books: an occasional over-positiveness and misuse of authorities, frequent laudation of things English and Irish, with contempt of the German scholarship which has made the writing of this book possible, and the omission or inadequate treatment of parts of the subject. This last defect may of course be excused by the necessary limitation of space, but it seems as if some of the disquisition on modern marriage systems, or on the moral influence of modern music, might well have given way to a recognition of the informal education supplied at Athens by the state in the public religious exercises, the statues, pictures, and buildings, and the conduct of government by public debate (a form of education to which Thucydides and Demosthenes both call attention), or to a discussion of the connection of education with religion. The account of Plato's ideal system of education will seem painfully superficial to any one who has read Nettleship's excellent essay on the subject in 'Hellenica.' With all these minor faults, the book has two supreme merits: it is interesting, so that one who has no special knowledge or desire for knowledge on the subject can read it with pleasure, and it is full of information, much of which is from sources that lie out of the range of ordinary reading. An amusing instance of the writer's insularity of feeling and habit of hasty inference may be seen in a foot-note on page 129: "All foreigners, on the contrary, seem to love official dress, whether military or not. I was once in Genoa during a regatta, when a crew of visitors from Spezzia or Livorno used to walk about the streets in boating costume, with their oars over their shoulders, to the admiration of the Genoese. Imagine the Oxford eight, the day before the University race, sauntering along Piccadilly in this style! I recommend this case to the theorists who maintain that human nature is the same at all times and places."

—It appears from a circular issued by the Trustees of the Peabody Museum of American Archæology and Ethnology that the income of the $90,000 remaining of the original endowment is, now that a building has been erected and stocked, not more than sufficient to provide for the care alone. "The increase of the collections must depend entirely upon gifts of specimens"; but these cannot be expected to keep the Museum abreast of the growth of science. The explorations formerly undertaken by the first curator, the late Dr. Jeffries Wyman, and the present incumbent, Mr. F. W. Putnam, have had to be suspended, thus cutting off the accumulation of material under the best auspices, and depriving the Museum of its share in the solution of the great problems of the prehistoric ethnology, migrations, and civilization of the continent. The Trustees now make an appeal for aid in renewing these explorations. The Museum is a local institution only in the sense of being established in Cambridge and not elsewhere. It is entirely free to the public, and students from any quarter can avail themselves of its already rich collections derived from the two Americas, from Egypt, Southern Africa, Asia, Australia, and the Pacific Islands, now on exhibition, and those from Europe ("particularly rich in objects illustrating the stone age of Denmark and Italy, and in interesting remains from the Swiss lakes") still to be arranged. Subscriptions may be sent to the treasurer, Mr. Theodore Lyman, No. 191 Commonwealth Avenue, Boston.

—The Peabody Institute in Baltimore has now in type something over 150 royal octavo pages of its catalogue, upon the preparation of which, by means of an analytical card catalogue, the working force of the library has been employed for the past thirteen years. It will require four or five years longer to complete the arrangement and printing of the catalogue, and it will then probably embrace over 4,000 pages, published in four or five volumes. The proof-sheets, covering thus far about two-thirds of the subjects and authors to be catalogued under the letter A, promise certain valuable improvements in the art of cataloguing public libraries in this country. Under a given subject, or author, will be found not merely an alphabetical arrangement of the main authorities and titles, but also an alphabetical grouping of the chief collateral material, monographs, essays, magazine articles, and the like, that may be found in the Peabody Library touching the subject or author in hand. For example, under the head of "Æsthetics" we find, first, an alphabetical list of authors who have written more or less systematic works upon this subject; and, second, in finer type, an alphabetical list of minor authorities, dissertations, and miscellaneous articles. The name of the author, if known, is the guiding principle of this arrangement, otherwise the catchword of the essay or monograph is given, like the names of authors, in bold heavy type, so as to attract the eye at once upon the closely-printed page. Under the head of an author, for example, "Arago, Dominique François Jean, 1786–1853," we find an alphabetical analysis of his 'Œuvres complètes,' seventeen volumes. Instead of reprinting the table of contents for each volume, the contents of the whole series are arranged alphabetically, the *catchword* (not necessarily the initial word) of the titles serving as a guide in the classification; for instance, "Sur l'*action calorifique* et l'action chimique de la lumière, v. 7; Sur les *chronomètres* et les pendules, v. 12." This system of registering articles by alphabetical catchwords becomes of immense value when applied to the publications of learned societies, like the literary collections of the French Institute, Cambridge Philosophical Transactions, the publications of the Royal Irish Academy, and of the academies of St. Petersburg, Berlin, Vienna, Brussels, and the archives of Munich, and even to English and American reviews. Most catalogues, if they take any notice at all of the contents of a long series of volumes, simply give the contents of each volume by itself, the result being, in the case of a very long series, that a student is sometimes obliged to look through several pages of chaotic titles in order to ascertain whether there is any material relating to the subject he may have in hand. This annoyance and grievous waste of time will be entirely spared if the Peabody idea is systematically carried out and subject-titles are arranged alphabetically with appended references to volumes, but without regard to the succession of volumes. It should be as easy to find one's way through a vast collection of monographs and special treatises as through a complete dictionary of the English or French language. The body of existing science should be an encyclopædia of knowledge, properly indexed for the use of students, so that they may add to its volume without duplicating the work of predecessors.

—The practical difficulties and labor involved in such a classification are beyond all estimate, for the present state of the world's scientific papers is but little removed from chaos. The Peabody idea has not yet been applied to the classification of the special articles on natural science to be found in the journals of European academies, but very much has been done in the fields of literature, art, and history. The idea is capable of indefinite expansion, and is only a suggestion of what the art of cataloguing a great public library of research may one day become.

The responsibility of the Peabody undertaking falls upon the Provost of the Institute, Dr. N. H. Morison, who, in his personal direction of this great work, is ably seconded by Mr. Philip R. Uhler, the official librarian of the Peabody. The pains these gentlemen have taken in simply laying the foundations for this catalogue is not, and cannot yet be, appreciated by the general public. The special, analytical card catalogue, registering not merely all books entered upon the public card catalogue, but all magazine articles, analyses of journals and literary collections, was an indispensable preliminary to a published catalogue. This work, when finished, will be a vast collection of bibliographies—literally thousands of classified lists—which will prove of the greatest value to Baltimore specialists, in showing what resources are already available, and will also be of the greatest convenience to the public at large.

—The flats of the Potomac River, which have so long been an eyesore and an injury to the health of the National Capital, seem at last to be in a fair way of reformation. The Potomac suddenly enlarges from a stream 1,000 feet wide at Georgetown to a broad bay, more than a mile across, at Washington. The retardation of the current on reaching this sudden enlargement naturally causes a deposit of the matters carried in suspension by the stream, and there is now a tract of nearly 700 acres in the middle of the river, almost under the windows of the principal executive departments, which is exposed at low tide, is contaminated with sewer discharges, supports a rank growth of vegetation which dies and rots in the early autumn, and sends forth with every southern wind a considerable amount of malarial poison directly into the most thickly settled part of the city. The present condition of the river is also injurious to navigation, by reason of the constant deposits in the channel leading to Georgetown as well as to Washington. The District Committee of the House of Representatives has reported favorably upon a bill for the reclamation of these flats, and the various plans of improvement have lately been examined by a board of well-known army engineers (Generals Gillmore and Comstock, and Colonel Craighill). They recommend that the entire space known as the flats be surrounded by an embankment with an inexpensive revetment, the portion north of Long Bridge to be filled to a height of six feet above the highest known flood, and that below the bridge to be filled to a small height above high tide; an inside channel to be left near the present docks in Washington, and the water in this channel to be renewed daily by means of large sluicing ponds or lakes with tidal gates, situated in the portion above the bridge. The earth for the filling is to be obtained by dredging the channels and these lakes. The reclaimed land above the bridge is to be made an extension of the present park stretching from the Capitol past the Smithsonian Institution to the Washington Monument. The cost is estimated at about $2,250,000, and the Board recommends an immediate appropriation of $1,000,000 in order that the work may be prosecuted rapidly and economically. Nothing would add so much to the beauty and desirability of Washington as a capital and a winter resort as the accomplishment of this plan. The bill, however, runs the risk of being smothered, because the District of Columbia has no political power or representation in Congress which can compel recognition; and although the work is one of really national importance, it is said to be opposed by the lobby which is clamorous for large appropriations for internal improvements.

—The English Dialect Society have brought out, under the editorship of James Britten, F.L.S., of the British Museum (Natural History Department), a reprint of 'The names of herbes in Greke, Latin, English, Duch & Frenche wyth the commune names that Herbaries and Apotecaries vse: Gathered by Wm. Turner.' Turner published it in 1548. This neat edition, published by Trübner & Co., is an octavo of 134 pages, has an introduction by the editor, a facsimile of the old title-page and dedication, and is augmented by an alphabetical list of Turner's English names, with the Latin equivalent he adduced, and the modern scientific name as determined by Mr. Britten, who is accomplished in botany as well as in old plant-lore. He was one of the editors of a 'Dictionary of English Plant-Names,' published by the same Society four years ago.

—The remaining portions of the Society's issues for 1881 are a paper read before the Manchester Literary Club by Mr. Wm. E. A. Axon, on "George Eliot's Use of Dialect," and another volume of "Original Glossaries," embracing Isle of Wight words, Oxfordshire words (supplementary), Cumberland words (a second supplement), North Lincolnshire words, and Radnorshire words. The first two of these lists are the fullest and most important, and sometimes offer curious comparisons one with the other—*e. g.*, in the harvest-home song, and in the magpie divination—(Isle of Wight) "One, sorrow; Two, mirth; Three, joy; Four, a birth"; (Oxfordshire) "One's a weddin', Two's mirth, Three's a berrin', Four's death." The Yankee, in the broadest sense, should feel at home on the Isle of Wight, peopled, by the way, as the editor of the Glossary believes, by the Jutes. One may hear *lowz* (no doubt, allows), as, 'I *lowz* we'd better go at wunce'; *nashun*, as, 'A *nashun* deeal o' rain'; *tarnashun*, as, 'I *Tarnashun* seize thee'; and the like. In Oxfordshire it is no surprise to find *form* a vulgarism for 'style,' as, 'What a *form* you 'a done that in.' Odd, however, is *come again*, to return after death like a spirit—*e. g.*, 'You remembers 'Arry Whitly as was cut t' pieces an the line? Well, he *comes agen strong*, in six pieces.' So, too, is *respectable* in the sense of any class above the laboring. 'Is she a *respectable woman*?' 'No, sir, 'er ent na more ner I be; 'er 'usbun works at the same farm as mine do.'

—A curious discussion has been carried on for several months in the *Times* and other London papers concerning the expediency of a tunnel under the English Channel. It appears that there are two English companies in the field, one presided over by Sir John Hawkshaw and the other by Sir Edward Watkin, both eminent engineers. Each company has filed its bill in Parliament, and each is not only prepared to prove the feasibility and desirability of the project, but is already provided with the necessary amount of capital fully subscribed, and is in relations with a French company which will meet it halfway. Both companies are, however, met with objections raised by certain military men on the ground that the tunnel will endanger the defence against invasion which England has always found in "the silver streak," and the *Times* asserts that "the expediency of the Channel Tunnel ought not to be determined solely by engineers and capitalists." Sir Garnet Wolseley and other soldiers contend that the English end of the tunnel might be captured by a sudden landing, and that continental soldiers could then be poured through it in unlimited numbers. Sir Edward Watkin and the engineers reply that "a pound of dynamite or a well-devised sluice would make the tunnel impassable." The subject has been brought up in Parliament, and Mr. Gladstone has given assurances that it will be completely considered. At this stage of the discussion one of the military fraternity has written a little book, in the style of the 'Battle of Dorking'—though greatly inferior to that doleful but captivating narrative—under the title of 'How John Bull Lost London; or, The Capture of the Channel Tunnel' (London: Sampson Low & Co.) One evening a vast number of French tourists come through the tunnel; they stop to pass the night at Dover, where at midnight they receive their arms from a French vessel, seize the end of the tunnel, fortify it, and repel the attacks of the Dover garrison—the wire to the dynamite and sluices having meantime failed to work. Six hundred thousand men come through the tunnel in an incredibly short space of time, defeat Lord Wolseley and his army in a bloody battle at Guilford, and capture London. They make no further advance, however, and subsequently the English collect an army of over a million of men, and advance to the siege of London. The French threaten to destroy the city and its inhabitants if they are not allowed to return to France unmolested, and they are permitted to depart. The tunnel which has been the cause of so much damage to London is then destroyed. It is obvious that much can be said on both sides of the question of the effect of the tunnel upon home defence; but if one half of the mistakes and confusion here recorded are possible, then nothing short of an iron wall of impossible height and unrivalled thickness can save England from invasion—tunnel or no tunnel. The *Times* gravely remarks that "it rests with statesmen to reflect whether this new link with the Continent would not facilitate the recurrence of the panics of invasion to which as a nation we have been prone." But it is a question whether the British public does not crave these panics as a regular part of its mental diet, and thank the man who originates them. The Franco-German war of eleven years since brought forth the 'Battle of Dorking,' which was a rich treat; the channel project has now produced 'How John Bull Lost London'; possibly another decade will perfect some form of flying machine casting the "silver streak" and the ironclads into utter insignificance; and then some new Chesney will cleverly tell 'How the French Locusts Devastated the British Isles.'

—It would require a long article, if not an entire volume, to do justice to the latest and most elaborate production of Dr. Augustus Le Plongeon, which comes before the world in the shape of a pamphlet of 86 pages, entitled 'Vestiges of the Mayas; or, Facts tending to prove that Communications and Intimate Relations must have existed, in very remote times, between the Inhabitants of Mayab and those of Asia and Africa.' As the author announces himself on the title-page a member of the American Antiquarian Society, the California Academy of Sciences, and several other scientific organizations, it is surprising to find a work of these pretensions bearing only the humble imprint of a New York "printer and stationer." Without attempting to exhaust his list of the things he has proved, we will mention that the Mayas were "a race autochthon on this continent, and did not receive their civilization from Asia or Africa"; that "in ages so remote as to be well-nigh lost in the abyss of the past, the Mayas were a great and powerful nation, whose people had reached a high degree of civilization"; that some of their edifices were finished at least 6,100 years ago (elsewhere it is shown that 19,000 years would be a moderate estimate); that in their palmy days these Mayas migrated westward from Mayab, "across the wastes of the Pacific Ocean," through India, Afghanistan, Babylonia, Asia Minor, Egypt, etc., etc., etc.;

that, "as the English of to-day, they had colonies all over the earth"; and that they left traces of their occupancy wherever they went—in language, customs, and monumental remains. The philological support of these facts is extraordinary beyond anything in our experience of linguistic aberration. Enough to repeat that the words which frightened Belshazzar on his palace wall were Maya words, having the very same meaning in the Maya language which Daniel gave them; and that the last words of Christ on the cross were "pure Maya vocables," and that they "have a very different meaning to that attributed to them" by the evangelists, "and more in accordance with his character." Conjectural emendations are not in much favor nowadays, but our author ventures on a slight amendment of the Scriptural text, and reads, "*Helo, helo, lamah zabac ta ni*," which, taken verbatim, signifies in the Maya language, "*Now, now, sinking, black ink, over, nose*"; or, more elegantly, "Now, now, I am sinking; darkness covers my face." Dr. Le Plongeon, it is well known, has made some laborious and valuable excavations in Central America, and is now engaged, under the auspices of Mr. Pierre Lorillard, in the delicate task of exploring the most interesting archæological area on this continent. While conceding to him and his devoted wife the earnestness and self-sacrifice of the Schliemanns, we cannot, in view of this pamphlet, think highly of him as a reporter of his own discoveries (through the N. Y. *World* and *North American Review*).

—A thin pamphlet from the African Club of Naples brings us a report of the joint committee made up from the Club and from the Chamber of Commerce as to the fishery of mother-of-pearl by Italians at Assab. It appears that this fishing-post, at the southern end of the Red Sea, was occupied with great hopefulness by the Italians, who were led thither by poetical and enthusiastic descriptions. The examining committee, however, report to the above Society that the weakness of the military and maritime force makes it unsafe to carry on commercial enterprises on so distant a coast, and pronounce the bay of Assab unsuitable for colonial, commercial, military, and naval purposes. There is also a decrease in the amount of mother-of-pearl. This article is greatly sought in India, but little in Europe, and is not marketable in Italy. Austria is the only Western country where it is much in demand. At Milan there is but one house working it, and this refuses the products of the Red Sea and accepts those of Ceylon, which are the best; the most iridescent, and therefore most valuable, are found in the Indian Ocean. The fishermen are usually Arabs, who endure great hardships, and have no protection save what is expected in the future from the Prophet. These and many other facts given to prove the region unsuitable for Italian occupancy afford foreigners a variety of information, in an enjoyable literary form, unusual in publications of the kind.

—Mr. Mapleson has abandoned the idea of producing the "Taming of the Shrew," with Minnie Hauk in the leading rôle, but he has at least kept one of his promises. Beethoven's only opera, "Fidelio," which had not been heard here for some years, was given at the Academy of Music last Friday evening before a very large audience, which presented a much more devout and musical appearance than is usually the case in this locality. Many who had doubtless come with the expectation of being disappointed must have been surprised at the comparative merits of the performance, which, it is true, was very far from being perfect, but was much better than frequenters of the Academy had reason to anticipate. The part of *Leonora* was unfortunately assigned to a débutante, Mlle. Dorani (alias Miss Henninges), who made her first appearance before a New York public, although she had previously sung the part in Cincinnati, where she received her musical education. Mlle. Dorani's voice has genuine and valuable musical qualities, but the difficult part of *Leonora*, of which the only adequate interpreters at the present day are Frau Materna, of Vienna, and Fräulein Brandt, of Berlin, is altogether beyond her powers of execution, even with such changes as she allowed herself to make in dangerous phrases. It requires not only a great vocalist, but also a good actress, to make the part of *Leonora* interesting, and Mlle. Dorani's acting was quite inadequate. Signor Galassi made good use of the insignificant part of *Pizarro* assigned to him, and Signor Novara and Mlle. Juch were satisfactory as *Rocco* and *Marcellina*, while Signor Ravelli sang with a taste and intelligence that contrasted strangely with his undramatic demeanor. The quartet No. 3 was encored, and other numbers were freely applauded, including the great Leonora overture No. 3, which was played between the first and second acts. Signor Arditi, as usual, had better command of his instrumental than his vocal forces, but he failed to infuse that life into the score which alone can redeem it from the charge of monotony. Beethoven's score bristles with dynamic signs, but Signor Arditi apparently recognizes but two, and it is astonishing to hear with what sublime composure and indifference his musicians will play forte throughout a page on which there are a dozen or more signs of crescendo, sforzando, piano, etc. As for the work itself, it has never obtained any general popularity, because it is neither a dramatic nor a florid opera, but rather a sort of cantata transplanted to the stage. The only really dramatic situation is the scene where *Leonora* points her pistol at *Don Pizarro*; and, thrilling as the music here is, it cannot be denied that the effect is wholly due to the unexpected trumpet call announcing the arrival of the minister, whereas the calm and simple phrase taken up by the orchestra immediately after the call is wholly inappropriate in such an exciting scene. Richard Wagner, in his highly eulogistic essay on Beethoven, correctly remarks that the subject of this opera contains so much which its author's mind could not assimilate that only from the marvellous third overture can we guess how the composer would have us regard it. This in fact contains in itself the most complete drama, the action of the piece seeming little more than a weak dilution of it, and standing to it in somewhat the same relation as a tedious and long-winded commentary of Gervinus does to a Shaksperian scene. Beethoven, like Schumann, often reveals a surprising dramatic fire in his compositions, but he was not able to write a dramatic opera. Had he felt in him the real dramatic impulse and instinct, he would have written more than one opera, even if compelled, for lack of anything better, to choose such frivolous and unworthy libretti as those which have been immortalized by the music of Mozart and Weber.

—For the one hundred and ninety-eighth concert of the Philharmonic Society, which took place on Saturday evening, an extra score of instrumentalists was engaged, which brought the number up to about one hundred and twenty. The newcomers, however, did not create the least disturbance, and everything was played as smoothly and with the same delicacy as usual, and of course with more power and a grander sonority. The concert opened with Schumann's "Genoveva" overture and closed with Beethoven's Fifth Symphony. But it was not for these well-known and popular compositions that the additional instrumental forces had been engaged. The interest centred this time in some selections from Wagner's "Rheingold," in which there is so much tone-painting that every added instrument supplies a new charm of color. Instead of leaving out such an important instrument as the harp, as was done last week by another orchestral society in a performance of selections from "Tristan and Isolde," Mr. Thomas generously supplied four of them. Unfortunately they had to be placed so far back on the stage, behind all the other musicians, that their effectiveness was greatly diminished. At the Bayreuth festival certain disadvantages connected with the excessively lowered orchestra made it desirable to use as many as eight harps. One important feature Mr. Thomas could not supply. Dramatic vocalists are rare in every country, and they seem to be almost non-existent in this. The soloists of the occasion, the Misses Schell, Wurmb, Henne, and the Messrs. Toedt, Steins, and Remmertz, not having any special training in this style of music, and lacking the inspiring effect of appropriate scenery and costume, did not succeed in rendering their parts with an emphasis and expression suggestive of the situation. All things considered, however, they acquitted themselves well, the melodious phrases of the Rhine daughters, sung behind the scenes, being particularly effective. In order to enable the audience to supply in their imaginations the absent scenery, Mr. Alfred Forman's translation of the German text was printed on the programme—a translation which would have been much better had not Mr. Forman endeavored to preserve the alliterative verse of the original. It is under all circumstances difficult to translate poetry. More difficult still is it to translate it so that the syllables shall harmonize with the notes of the music; and when to this is added an attempt to preserve the alliterative form, the difficulties become simply insuperable. This translation was only printed for the benefit of the audience, for the soloists, being Germans, used the original text. Mr. Thomas had, with a keen eye, selected those passages in the drama best adapted for concert use, embracing the introductory scene with the gambols of *Alberich* and the Rhine daughters; the scene on mountain heights where *Wotan* awakes and beholds the mighty castle built for him by the giants; *Loge's* account of his adventures in search of a ransom for *Freia*; and the closing scene, beginning with the cloud- and storm-compelling *Donner* and ending with the laments of the Rhine daughters for the lost gold. The motives thus selected are among the most characteristic in the whole Trilogy. "Rheingold" contains the germs or buds of many of the leading-motives which develop into full-grown blossoms and trees in the later dramas—as, for instance, the *Waldweben* motive which is foreshadowed in *Loge's* tidings. Some of these motives, however, such as the songs of the Rhine daughters, the grand Walhalla motive, and the wonderfully suggestive Rhine motive, with its stupendous organ point extending over 136 bars, attain their full growth and development in "Rheingold." Taken as a whole, "Rheingold" has less musical value than any one of Wagner's operas excepting "Rienzi." There is much admirably characteristic and descriptive music in it, but of beautiful music, in the technical, æsthetic sense of the word, there is not very much. It is, indeed, observable in most of Wagner's works, that the scenery and the music stand in an inverse relation to each other in point of attractiveness. Thus "Tristan and Isolde," in which there is little scenic display, is his most perfect work from a musical point of view, while "Rheingold," with its varied ac-

tion and its marvellous scenery beneath the waters of the moving Rhine, in subterranean caverns, and among clouds and rainbows, offers so much to the eye that the ear can readily dispense with its customary feast of sweet sound.

NEW LIGHT ON SIBERIA.

Through Siberia. By Henry Lansdell. 2 vols., 8vo. Boston: Houghton, Mifflin & Co. 1882. Maps and illustrations.

MOST nations, possessing rights of occupancy in lands external to their own normal boundaries, have at some time incorporated in their criminal code some form of transportation as a punishment for certain grades of crime. This has been the case with Spain, Portugal, Great Britain, Russia, and France. In England, transportation to America began in 1619, but was not systematized until a century later. Convicts were first sent to Australia in 1786, and the system practically came to an end about thirty years ago. It was adopted in France during the time of the Directory for political offences, fell into desuetude, and was again revived there about the time that it was abandoned by Great Britain. France, Russia, and possibly Portugal, are the only nations which at the present date retain this mode of punishment.

Theoretically, transportation might be made the means of conferring benefits of no mean order on both the criminal and the community; hence, thirty years ago, Charles Kingsley could describe in good faith the felon condemned to transportation as really more fortunate than the luckiest uncaught thief who walked the streets of London. In practice, however, the plan has usually worked badly, except for limited periods and under especial administrators. In nearly all countries it has been, or has been alleged to have been, accompanied by what the sentiment of the present day stigmatizes as gross inhumanity. Prisoners guilty of certain political offences have in all the above-mentioned countries been included among those subject to transportation. Apart from the shocking brutalities revealed by the Parliamentary investigation of 1838 into the condition of transported convicts (of which some details may be found in Mary Carpenter's 'Our Convicts'), and of which Earl Grey in 1847 declared the details to be "horrible" and "monstrous," convict testimony has from time to time reached the outer world from West Australia, from Cayenne, from New Caledonia, and from Siberia, which indicated the existence of most melancholy relations between the prisoners and their duly constituted guardians. Except in the case of Siberia, however, these complaints seem to have produced little effect upon the Anglo-Saxon mind. Whether Irish "patriots" and French "communards" are supposed to be less reliable witnesses than Russian Nihilists, or whether the fact that the latter are usually called "exiles" and the former "transported convicts" has influenced the course of public sympathy, is uncertain. The lash was used as a means of discipline in Cayenne and Australia, as it is to-day in London, Delaware, and Virginia; but in these localities it has not excited that horror which has attended the rumors of its use in Nertchinsk and Sakhalin. Whatever the cause may be, there is no doubt that the phrase "transportation to Siberia" is generally associated with the idea of exceptionally inhuman, though not very clearly defined, punishment, administered by irresponsible and brutal officials.

The explanation may reasonably be sought in the mystery which has enveloped Russia from the days of Vladimir as in a dark and murky cloud. The imagination has thus been left to picture to itself a wilderness populated by barbarians, in whose recesses, defended by the ramparts of the Ural, stretch the chill and gloomy tundras of Siberia to the far borders of the icy sea. Whether this cloud of ignorance and misconception will be dissipated until Russia enters the circle of nations on the Mediterranean, and her commerce ebbs and flows, untrammelled by winter, from the Golden Horn, cannot be foretold. In the absence of that intimate acquaintance which can only be gained from free and long-established commercial intercourse, the best substitute is the testimony of frank and unprejudiced witnesses. Such appears to be contained in Lansdell's 'Through Siberia.' Much injustice would be done the author were it to be inferred that in these two handsome volumes, crowded with illustrations, the condition of Siberian prisoners and prisons is the sole or even the predominating topic. The author's specialty in Siberia was the visitation of its prisons and penal institutions, considered rather from a philanthropic and religious than from an economic or administrative standpoint. A chief part of his task was the distribution of religious and educational literature, including portions of the Scriptures, to prisoners and others. On his return he decided to supplement the account of his personal adventures from published information and to describe the country as a whole. This he has done in a very efficient manner, and without (unless in foot-notes) degenerating into dryness. Having traversed the country from St. Petersburg to Nikolaievsk and Vladivostok, and thus obtained a personal view of all the better portions of Siberia, he has been enabled to present a more accurate and thorough picture of that immense province than any hitherto accessible to English readers. That it is far from being an inhospitable desert he makes evident, and, in addition to an enumeration of characteristics, resources, and industries, he gives for most parts of it a sufficiently full historical synopsis.

Nevertheless, for the general reader there is little hazard in affirming that the value of the work consists principally, if not solely, in the new light it sheds upon the status, character, and condition of the convicts usually known as "Siberian exiles," and the prisons where they are detained when, as is generally the case, imprisonment forms part of their sentence. Hence our review will be chiefly devoted to the new facts presented on this subject. A frank and philanthropic spirit pervades the book, with no touch of cant in it. The author recognizes the limitations under which his observations were made, and mentions that his proof-sheets have been revised and approved, not only by an Inspector of Prisons (among other Russian friends), but also by released political exiles who have worked in the mines. Mr. Lansdell was the better prepared for his task by having visited and furnished with suitable literature prisons in nearly every country of Europe, including European Russia. He appears, though it is not distinctly so stated, to have been an unassigned clergyman of the Established Church, occupied for the most part with more or less secular duties, whose vacations were chiefly passed in the laudable task above mentioned. Having determined to visit Siberia, as he had already visited Russia, provided it was possible to obtain permission, it was somewhat of a surprise to his friends, as it will doubtless be to a vast majority of his readers, that the desired permission was granted without hesitation.

"The open manner in which the letter was granted seemed to show that the authorities had nothing to hide. A master-key was put into my hand that opened every door. I went where I would and almost when I would, and on no single occasion was admission refused, though often applied for at a moment's notice. Statistics, also, were freely given me, though this was 'not so writ in the bond.' An afterthought, in Siberia, emboldened me to ask for them in various places, and they were usually furnished then and there."

Not only was the Minister of the Interior complaisant, but the Metropolitan of Moscow "entered with zest into my scheme for distributing the Scriptures, said that the Russians had not the means to perform all they would, and commended the English for what they were doing." The works distributed consisted of the four Gospels, the Book of Psalms, New Testaments, an adapted reprint in Russian of the *British Workman*, an illustrated weekly newspaper, illustrated parables, tracts, and mottoes suitable for hanging on walls—all mostly in the Russian language, and which had passed the censor. They numbered 56,000, and comprised three wagon loads. The author states that "never certainly in any other country have I met with such eagerness to get Scriptures and good books. This extends to both clergy and laity," besides the prisoners, for whose benefit the attempt was primarily made.

The number of ordinary exiles sent to Siberia annually of late has been about 18,000, including wives and children who voluntarily accompany prisoners. They come from all parts of Russia, and on arrival in Siberia about 8,000 are set free to gain their own living. About three or four per cent. are from the upper classes, and perhaps twenty-five per cent. of the whole number are able to read and sign their names. About twenty per cent. are merely vagabonds, who from drunkenness or bad habits have become nuisances to their neighbors, and have been condemned as such in the village assembly. Religious dissenters, except the self-mutilating sect, are no longer sent to Siberia, and "the great mass of exiles are nothing more nor less than ordinary criminals, such as may be found in any of the prisons of Europe." It must be remembered that murderers (not also guilty of treason) are not hanged in Russia; and it is this class and others convicted of especially infamous crimes who form the great majority of prisoners in the extreme east of Siberia and the Island of Sakhalin. Thus, of 440 prisoners received at Nikolaievsk in 1878, 206 were murderers, and eighty guilty of robbery, arson, or incest, the remainder being chiefly incorrigible vagabonds and runaways.

The exiles are divided into two classes, whose sentences vary widely. The first comprises those who lose all their rights and, except for purposes of punishment, become outlaws in the fullest sense of the word. The second class are deprived only of part of their privileges, and are settled as colonists either at once or after a term of imprisonment; or may merely owe a certain amount of labor to the Government and have the remainder of their time to themselves. In general, those deprived of all their rights are sent to eastern and the others to western Siberia. Murderers are largely sent to Kara, where Mr. Lansdell found eight hundred of them; political prisoners go to Kara, to the Trans-Baikal district, and to the Yakutsk Government. None of these last are sent to Sakhalin. The ordinary prisoners are sent in barges, by rail, and by wagons from Nizhni Novgorod to Tiumen, the first prison in Siberia proper. Thence they are distributed. If destined for western Siberia, they are assigned to particular towns and villages, where they are sent if possible by water, or, if not, on foot. Those condemned to eastern Siberia are taken by water to Tomsk, whence their walking begins. Under ordinary circumstances they rest one day and walk two, marching sometimes twenty miles a day.

Temporary prisons are erected along the road to receive them for the night, and in the towns are larger buildings provided with medical attendants, where they may rest if necessary a longer time. Prisoners for Sakhalin have recently been sent direct, *via* the Suez Canal, making the passage in about two months, without a single death, and arriving in excellent condition, notwithstanding Russophobist stories to the contrary. Political prisoners are treated quite differently, being individually placed between two officers and taken in separate vehicles direct to their destination. They are not allowed to be out of sight of their guards or to converse with outsiders.

Of the institutions in which the prisoners are confined the author says:

"I have met with a deep and almost universal conviction that the prisons in Siberia, compared with those in other countries, are intolerably bad. This I cannot endorse. . . . Comparing the convicts of the two nations as they now are, . . . the Russian convict proves to be fed more abundantly, if not better, than the English convict, and the clothing of the two, having regard to the dress of their respective countries, is very similar. A convict's labor in Siberia is certainly lighter than in England; he has more privileges; friends may see him oftener and bring him food; and he passes his time not in the seclusion of a cell nor under imposed silence, but among his fellows, with whom he may lounge, talk, and smoke."

Mr. Lansdell points out, however, that of instruction, efforts toward reformation, and religious services there are little or none; and also that the want of suitable labor upon which they may be employed leaves large numbers of prisoners, in several of the prisons visited, in a very undesirable state of idleness. In regard to only one prison, that of Dui on Sakhalin, which he did not personally visit, did the author obtain what seems to be reasonable evidence of abuses and of defective food. The latter, deprecated by the resident Russian officers, seemed to be the result of rascality on the part of contractors who furnished the food.

Corporal punishment cannot be inflicted in Russia on a free man for a first offence. In eastern Siberia, at Kara, Nikolaievsk, and Dui rebellious prisoners may be whipped either with birch switches or with a three-tailed "cat." The latter, according to the law, is reserved for those who, condemned to hard labor, have committed further crime in Siberia. These, it should be remembered, are mostly such as in England would be hung outright. Much use has been made in certain romantic publications of the "mines" of Siberia. The "quicksilver mines," so often described, do not exist, and do not appear ever to have existed. There are none in Siberia. The silver mines of Nertchinsk, formerly worked, have been sold or abandoned; at all events they are no longer worked by convicts, and seem to have been neither better nor worse to work in than silver mines in general. In no case were convicts housed under ground, as has been asserted, though they were obliged to work on Sundays. The gold mines of Kara, still largely worked by convicts, are simply open placers, or gravel pits, from which the material for washing is excavated at the rate of a seven-foot cube to three men per day.

That the number of political prisoners is very much less than has been ordinarily supposed, there is no doubt, and the author goes into considerable detail (in the absence of exact statistics, which, though the author did not know it, might have been obtained from Russian sources) to show how this must be so. In 1881 only seventy-two out of 20,000 exiles, or less than one per cent., were politicals; and of these nearly or quite half were condemned in previous years. Cases of inhumanity, corrupt practices, and bad behavior on the part of prison officials are duly set forth by the author from information furnished him, but these seem to be rather individual than typical, and on the other hand he found more than one officer who took an intelligent and humane interest in his wards. We can follow our worthy traveller no further into the details with which his volumes are replete. It is sufficient to say that we are greatly in his debt for having enabled us to estimate more justly not only the humanity of the Russian Government and the growing civilization of a mighty nation, but the character of much rubbishy literature which will now sink to its proper level. A praiseworthy bibliography and a fair index conclude the work, which is presented in excellent dress by the publishers.

COMMON SENSE ABOUT WOMEN.

Common Sense about Women. By Thomas Wentworth Higginson. Boston: Lee & Shepard. 1882.

In this volume Mr. Higginson gathers up, as into a larger tract, articles which represent two years' weekly contributions to the *Woman's Journal.* To give point to them he has grouped them under appropriate heads, such as, Physiology, Temperament, The Home, Society, Education, Employment, etc. They have a regulation length of about three pages, and possess a literary quality which, as much as their shortness, makes them easy reading. In one respect the collection is disappointing: we miss the background of the medium in which the articles originally appeared, and their merit appears less conspicuous than by contrast with the dull and slipshod and frequently erratic editorial writing of the fourth page of the *Woman's Journal.* Naturally, too, we lose sight of the fact that the articles were conceived to some extent (perhaps unconsciously) in a sort of criticism and control of the editorial conduct of the paper and the cause; and that they were addressed mainly to women, and to women, again, for the most part in need not so much of conversion to the general doctrine of woman-suffrage, as of having their attention directed to the respectable and honest grounds of opposition, and to facts which, however disagreeable, it was the part of "common sense" to look in the face. Indeed, it might almost be said that Mr. Higginson's stated column in the *Journal* is the only one in which there has been a general discussion on the subject of woman's rights and duties, and where you might expect to find some notice taken of the current sentiment of the press.

To comment on a series of articles embracing so many topics is naturally difficult, and we shall confine ourselves to a single, though somewhat comprehensive, shortcoming. It is a frequent criticism in the history of opinion that those persons who first rebel against any long-established superstition seldom succeed in entirely emancipating themselves from its influence. This remark is particularly applicable to many persons who pretend to enlightened views on the "woman question." They cannot divest themselves of the ancient prejudice that woman's nature is an incommensurable quantity, not to be judged by the standards applied to men. An extraordinary evidence of the bias we speak of is the argument cited by Mr. Higginson (p. 11 *et seq.*) from the lecture of Henry Thomas Buckle upon "The Influence of Women on the Progress of Knowledge." As Mr. Higginson attaches great value to this argument, it may not be amiss to analyze it. It is intended to establish two propositions: "first, that women naturally prefer the deductive method to the inductive; secondly, that women, by encouraging in men deductive habits of thought, have rendered an immense, though unconscious, service to the progress of knowledge, by preventing scientific investigators from being as exclusively inductive as they would otherwise be." The whole attempt to establish these propositions is based upon an equivocal use of the term "ideas" and an indefinite use of the term "deductive method." Buckle defines the deductive method as that which *begins with ideas*, or which *begins with the internal world and proceeds to the external.* He then concludes that women are "more deductive than men" because "they are more emotional, more enthusiastic, and more imaginative than men," and "therefore live more in an ideal world," and because "they possess more of what is called intuition." Hence "they prefer a method of inquiry which proceeds from ideas to facts." Finally, Buckle illustrates the "triumph of the deductive method" by the instances of Newton's discovery of the law of gravitation, Haüy's discovery of the law of the forms of crystals, and Goethe's theory of the metamorphoses of plants, and concludes that the influence of women must tend to promote the use of that method by which these brilliant discoveries have been obtained.

Now, the whole connection of this argument depends upon the assumption that the "emotions" and "enthusiasm" in which women revel beget such "ideas" as those with which the deductive method begins. Mill declares that the deductive method "consists of three operations: the first, one of direct induction; the second, of ratiocination; the third, of verification." The celebrated discoveries mentioned by Buckle are instances of that particular form of the deductive method in which an hypothesis is substituted for induction as the first step of the process; and in his talk about the deductive method he seems to have entirely forgotten those applications of it in which the first step is induction. These hypotheses which may be substituted for induction are the "ideas" with which Buckle says that the deductive method begins; but of what nature are such ideas? Are they arbitrary fictions, thrown out by the wanton play of an ignorant imagination in the effervescence of emotion? Far from it. The hypotheses to which science yields respect are those which, to use Mill's words, "ally themselves by analogy with known laws of nature." Such hypotheses are, in fact, arguments from analogy, approximating indefinitely, by the accuracy and breadth of observation upon which they are based, to valid inductions. Such hypotheses are begotten in minds so penetrated by the organic unity of nature that they are ever alert to detect the occult correlation of her myriad members; so charged with stores of well-coördinated experience that each fresh object fires a far-reaching train of association; so habituated to abstraction that no protean phases of phenomena can obscure essential identity. What have these "ideas" in common with the rash leaps in the dark by which such uneducated minds as those of women strive to span the abyss of their own ignorance and indolence?

The power of "intuition" which popular superstition attributes to women as synonymous with divination, is really only evident within the sphere which has hitherto absorbed women's energies—*i. e.*, domestic life—and it therefore admits of the same explanation as many other cases of so-called intuition: the sub-conscious registry of extensive experience. In their psychological explanation, these feminine intuitions certainly resemble the hypotheses of science; but while the scientist infers from law to law, women are mainly engaged with purely individual and personal judgments; they have never made any important original contribution to

science even in psychology or sociology; and Mr. Buckle does not support his theory of the fertility of the female imagination by a single instance of a valuable hypothesis conceived by a woman.

Supposing, however, that women were capable of forming scientific hypotheses, this would not indicate a deductive turn of mind. The deductive method derives its name from its second constituent process, that laborious ratiocination in which Buckle does not even pretend that women have ever distinguished themselves. The first step, provisional hypothesis, for which Buckle asserts that the feminine mind is peculiarly adapted, is really a sort of pseudo-induction. Thus the second fallacy in this strange argument is the inference that the feminine mind is deductive from the assumption that it is inclined to hypothesis or speculation. The argument of Buckle seems, then, quite inadequate to prove that women possess the quality of mind which he attributed to them, or that they are in general fitted to advance the progress of science, either directly or through their influence upon men. It is, however, conceivable that, as an exceptional occurrence, women should, from time to time, throw cut some gleam of thought which they cannot themselves mature, to fructify in the male brain; but there is no explicit record of such a process, and it does not promise great results. Few people feel enough interest in the rudimentary thoughts of others to take the trouble of developing them.

A curious illustration of the arbitrariness of former generalizations as to the nature of women is the fact that Mill, in his 'Subjection of Women,' attributes the value of their intellectual influence to a character of mind exactly the opposite of that upon which Buckle bases his claim for them. While Buckle lauds their imaginative flights, Mill inclines to believe that "the general bent of their talents is toward the practical," and dwells upon "the gravitation of women's minds to the present, to the real, to actual fact." Happily the wide opportunities of actually testing their abilities now open to women are rapidly rendering the interest of all these speculations purely historical, and tending to prove that sex does not appreciably influence the quality of intellect. There is little danger any longer that Buckle or any one else should persuade women that there is a feminine road to learning or to efficiency of any kind.

GARDINER'S CHARLES I.—II.

The Fall of the Monarchy of Charles I., 1637-1649. By Samuel Rawson Gardiner, LL.D. London: Longmans, Green & Co. 1882. 2 vols.

Mr. Gardiner brings into prominence one fact with regard to the Great Rebellion which may easily be overlooked—namely, that the Puritan movement was a conservative movement which, under the stress of circumstances, took a revolutionary turn. To speak of the conservatism of Puritanism appears at first sight paradoxical. But any one who carefully studies the facts collected in Mr. Gardiner's volumes will soon perceive that the efforts of all the Puritan leaders down to and including Pym, as well as the wishes of the English nation by whom these leaders were supported till near the outbreak of the Civil War, were directed not toward speculative or even practical reforms, but toward the maintenance of the national constitution in church and state.

In ecclesiastical matters the conservatism of the English people at the earlier part of the seventeenth century is past dispute. Calvinistic Protestantism was, when James I. ascended the throne, the prevalent—one may say, the recognized—creed of the country. Laud, from the moment when he began his career, was an innovator. According to the estimate formed of Laud's doctrines, he may be called a reactionist or a reformer; no competent critic can call him a conservative. He no more wished simply to keep matters as they were—to stand upon the old paths—than did fifty years ago Newman and Pusey in England, or Lammenais or Lacordaire in France. A reaction is as much innovation as is revolution, and the whole spirit of Laudian theology and of Laudian policy was a spirit of reaction against the predominant Calvinism of the age. It was from the Archbishop and his followers that came all the changes in doctrine and in discipline. The policy of which Laud was the representative aimed at nothing less than the substitution of Anglicanism throughout the Church for evangelicalism. The use of either term as applied to the seventeenth century involves indeed not only a verbal, but to some extent a real, anachronism. Still, there is no way of giving so clear an idea of the general nature of the religious conflict which culminated in the rebellion as by describing it in modern terms as a contest between the theories of evangelical Low Churchmen and the theories of Anglican High Churchmen.

When once a student realizes the fact that the Anglicans were in the first instance the advocates of change, he finds it easy to understand how it was that even on the very eve of the Rebellion the prevailing sentiment of the nation was one of ecclesiastical conservatism. To check the tyranny of the bishops, to undo the results of Laud's labors, to restore things as far as possible to something like the order which had existed under Elizabeth, was, as Mr. Gardiner shows in page after page, the object of almost every member of the Long Parliament. The "root-and-branch" men were a small though influential minority. The men of culture, like Falkland or Hyde, were a small and not very influential minority. The vast majority, though indignant at the bishops, were not even determined foes to moderate episcopacy. Few, as far as one can judge, were the men who really wished to impose the Scotch Presbyterian systems on England. Gradually, no doubt, the sullen ill-feeling of the gentry and the middle class gave encouragement to the wilder and more vehement Puritanism of those whom Laud contemptuously styled "the vulgar sort." But even as late as the meeting of the "Short" Parliament the assailants of the court were not prepared for violent alterations.

"It cannot be denied that to grant Pym's demands would have broken up the church system of Charles and Laud. But though some of the more extreme ceremonial forms would undoubtedly have been prescribed, the whole tone of his speech was in favor of a liberal and comprehensive treatment of the church question. The necessary restrictions upon conscientious religion held far the largest space in his argument. Even when Pym spoke of practices to which he took objection, it was the compulsion even more than the practices which he held up to animadversion."

Even after the meeting of the Long Parliament, there was little public sympathy with the sectaries. "A very general sentiment was expressed in a doggerel verse which appeared" late in 1641—

> "When women preach and cobblers pray,
> The fiends in hell make holiday."

This feeling found expression in the House of Commons. "Holles complained (June 7th) of certain 'mechanical men' who had been preaching in London, 'as if instead of suppressing Popery' the House 'intended atheism and confusion.' The Speaker was directed to reprove them and to send them away with a warning to offend no more."

The English people wished in the main to keep to the old paths and to advance a little further along them in the direction suited to the bent of the national genius. The churchmen of the day wished to drive or lead the nation along a new road which, as the majority of English Protestants believed, led to Rome. It was this effort to put force upon the will of England which provoked the conservative instincts of Englishmen. Resistance which ended in revolution was, in ecclesiastical matters at least, resistance to change.

If Puritanism was in the main a spirit of Protestant conservatism in the ecclesiastical sphere, it was even more obviously a spirit of constitutional conservatism in the realm of politics. Reverence for the King, which, under the Tudors, had become identified with loyalty to the state, was an all but universal sentiment. A divine who may stand as a fair representative of moderate Puritanism writes in 1642 (the date is worth notice): "As the killing of a king is amongst men a crime so hainous that no tortures can exceed the desert of it: all torments are too little, any death too good for such a crime: so sin, which is, *Dei cidium*, a destroying of God so much as in us lies, is so hainous that none but God himselfe can give it a full punishment." And the notion which he expresses, that regicide was not only a crime, but also one of the most detestable of sins, was undoubtedly the idea of his age. The Long Parliament, again, was an assembly guided by lawyers, who exerted an influence which will never again fall to the legal profession; for law had in the seventeenth century something of the interest possessed by science in our own time. It was, together with theology (with which it had a close connection), the chief intellectual pursuit of the day. Hence the Long Parliament displays a passion for legality.

"A charge has sometimes been brought against the Englishmen of that day that they concerned themselves overmuch with legality and precedent. Undoubtedly they loved to dwell upon the antiquity of the rights which they claimed. Antiquarians like Selden or Twysden expressed the tendencies of their age as truly as thinkers like Voltaire or Rousseau expressed the tendencies of theirs. But the legality which they cherished was the legality of a nation which had hitherto preserved unbroken the traditions of self-government. Spoken or unspoken, beneath all the technicalities of the lawyers, beneath all the records of the antiquaries, there remained an undertone of reliance upon the nation itself."

The concluding words of this quotation are undoubtedly true; but a House of Commons in which a pedant like Sir Symonds D'Ewes played a leading part, and in which the doctrine could be held that money which could not without sin be paid as "interest" might innocently be paid as damages, must have had a fine taste for the subtleties of the courts, and could assuredly not have been swayed by revolutionary ideals. When to this it is added that the object of the Parliamentary leaders was to act in unison with the House of Lords, a body which then in reality no less than in name consisted of friends and guests of the King, it is clear enough that the members who came up to the Long Parliament were as little inclined for fundamental changes in the Constitution as any assembly which has ever met together in England. Their object was to restore, not to innovate; to bring the action of the Crown into harmony with the wishes of the nation, not to set the Houses of Parliament above the King. Yet this Parliament of ecclesiastical Conservatives and constitutional Whigs gave rise to the most violent revolutionary movement recorded in the history of England.

The "root-and-branch" men, who must at all times have formed a minority of the House of Commons, ultimately became the ruling spirits of the hour. Constitutionalists were thrust aside by revolutionists. How did it happen that a movement, begun to resist the encroachments of the Crown, turned into an attack, first on the rights, and then on the existence of the Crown?

A full reply to this question could be found only in the investigation of certain general causes to the existence of which Pym and Charles were, we may suppose, equally blind. To restore the powers of Parliament was, at the very lowest, to attempt a return to the Lancastrian as contrasted with the Tudor constitution. But it was in fact much more than this: it was an attempt to give definite shape to constitutional rules which had never possessed more than a vague and conventional validity. Conservatism may unconsciously be the mask of revolution. When the Hungarians rose against Austria in 1848, the Magyars meant to protect their ancient constitution. That this was their true aim is shown by the success achieved eighteen years later by the policy of Deák. But, for all this, the leader of the movement of '48 was a revolutionist aiming at the absolute independence of his country. Kossuth was the head of the "root-and-branch" men who, from the stress of circumstances, came to the front and forced constitutionalists to acquiesce in measures utterly foreign to constitutional theory.

But if general considerations explain the gradual triumph of the Independents, there existed, as Mr. Gardiner well points out, one special definite cause for the failure of all the efforts made by moderate men to keep within the lines of the Constitution. "Character," it has been said, "is destiny." If this was ever true of any man, it was true of Charles. The rooted faults of his character explain both his own calamities and the policy of his opponents. Never did there exist a monarch who showed less grasp of realities. The facts which never struck him were the patent and large facts of the situation. It was, for example, clear that the English people had no dislike to the power of the Crown. What they wished was, not that the royal authority should be diminished, but that it should be, as in the time of the Tudors, employed for objects which commanded the sympathy of the nation. The mass of men do not care much for security against tyranny as long as the force of the Government is employed in ways which they approve. German Liberals easily pardoned Bismarck's defiance of Parliament when they saw that an army raised in violation of all constitutional principle would be employed to ensure the unity and to increase the power of Germany. Charles, while making every effort to increase his power, made no effort whatever to employ resources gained by straining the prerogative, so as to conciliate the good-will of England. It was, again, patent that the Stuarts possessed an immense advantage in the possibility of playing off Scotland against England. It is hardly an exaggeration to say that they might have been despotic in either country, could they have made themselves popular in the other. Charles, with something like fatuity, contrived so to misplay his game as to make Scotchmen and Englishmen for the first time merge the hostility of centuries in their common hatred of the King. It was, lastly, absolutely certain that if Charles could even for a time make himself trusted, there would almost immediately be a reaction of English feeling in his favor.

This is no speculative hypothesis. As a matter of fact, popular trust and popular favor began once and again to gather round the throne. During the few months preceding the arrest of the five members the current of public opinion was, as Mr. Gardiner convincingly shows, turning toward the support of the Crown. If we ask why Charles could never at any moment avail himself of the advantages of his situation, the reply is a clear and short one. He was a confirmed liar and plotter, who, gifted with some talents, was utterly deficient in sense and insight. His lies and his plots were his ruin. On this point Mr. Gardiner's authority is beyond appeal. That the leading statesmen of the day perceived that Charles's word could not be trusted is certain. Mr. Gardiner shows that they had even better grounds for their distrust than they themselves could have produced. The introduction of foreign troops into England was a notion constantly before the minds of Charles and his court. Spain, Rome, France, Holland were each and all of them solicited for aid. If there was one act which could give more deadly offence to national sentiment than even the employment of foreigners, it was the intrigue with the Irish insurgents. They were looked upon in 1641 as Indian Sepoys were regarded in 1857. Yet that Charles did in some measure intrigue with the Irish Catholics is certain. How far he went appears, as we understand Mr. Gardiner's narrative, to be a matter of doubt. In England and Scotland plot followed plot. The first plot with the army, the second plot with the army, "the incident," are ample proof of the King's constant and unscrupulous intrigues. The attempted arrest of the five members was clearly enough nothing less than an abortive attempt at a *coup d'état*. That Charles might have far better attained his end by waiting two or three months longer, till a time when he might have commanded a majority in the House of Commons, showed his utter want of statesmanlike patience; but it does not show that the meditated stroke was in itself ill-conceived. One may well believe that the liberties of England were never in greater peril than on the day when the King forced his way into the House of Commons followed by a body of armed desperadoes. The *coup d'état* failed, but it transformed a constitutional contest into an armed conflict. No terms can be made with a monarch whose word cannot be trusted. When a compact between King and people became impossible, civil war became inevitable. But the imminence, and still more the outbreak, of civil war changed the whole relation of Parliamentary parties. The supporters of the monarchy left Westminster. A revolutionary minority of the Parliamentarians were the only persons capable of carrying on civil war with effect. The "root-and-branch" men became the natural masters of the situation.

ZOLA AS A CRITIC.

Documents Littéraires: Études et Portraits. Par Émile Zola. Paris: Charpentier; New York: F. W. Christern.

In a series of portraits and essays on Chateaubriand, Victor Hugo, A. de Musset, Théophile Gautier, George Sand, Dumas, *fils*, and Sainte-Beuve, M. Zola makes an effort to do justice to the Romantic school in French literature, and to give a fair idea of the value and position of the authors of whom he treats. These essays were first published a few years ago, in a Russian magazine, and called forth a storm of indignation in France. They are now offered in book form to the public, so as not to suppress "the literary campaign in Russia." Zola declares, in his short preface to this volume, that he feels inclined to emphasize the opinions herein expressed.

In the first essay, on Chateaubriand, he writes: "My great desire above all things is to be just. I should not wish, because of my own literary convictions—all in favor of the modern school of exact analysis—to be unjust to a writer whose part was really colossal. I only thirst for truth; and criticism in my eyes is simply a kind of historical romance—the anatomy of a person who has existed, and who has left documents so that we can study him at leisure." It is evident, in fact, that Zola found it far easier to be just to Chateaubriand (who, although he was the pioneer in Romanticism, is now almost forgotten and seldom read) than to the living poet and literary sovereign, Victor Hugo, whose fame and influence can be compared only to Voltaire's. Of Hugo he writes:

"Victor Hugo, who has dragged after him long trains of faithful followers, will not leave a single disciple to assume and establish the master's religion. All the noise which has been made round the living writer will gradually subside at his death. Posterity will lose its interest and become severe. And do you know why its judgment will be severe? Because in Victor Hugo the initiator has deceived himself, and has only brought his personal phantasy into play, instead of finding the broad current of the century, which runs to exact analysis, to naturalism. All this mediæval bric-à-brac will be held cheap: it has not even the merit of being true to history. Posterity will be astonished that we accepted this tremendous mass of error and puerility without mockery. Posterity will seek the philosopher, the critic, the historian, the novelist, the dramatic author, and when it finds only a lyric poet, it will give him his place, and a very high one; but the whole century will not be given to him, for instead of filling it with light, he nearly choked it with the thick mass of his rhetoric. He did not consult truth; he was not the man of his age, whatever may be said; and that is enough to explain why in the future Balzac's fame will increase, while Victor Hugo will lose his height."

Zola considers himself, together with Flaubert, Daudet, the Goncourts, and the new Naturalistic school of writers, as descendants of Balzac, whose influence thus extends and will live on, while Romanticism ends with Victor Hugo, who has not one worthy follower, though surrounded by an immense circle of weak flatterers always ready to give up their personality in order to kneel before the master. He describes Victor Hugo as living like a king among courtiers who never let anything but the grossest flattery approach him. The most respectful criticism is not tolerated, and it is difficult to coin words adequate to express the extreme admiration any fresh utterance produces. "Extraordinary," "colossal," "titanic," "superhuman," seem all too mild for those devoted followers. "I do not believe in Victor Hugo's descendants. He will carry Romanticism away with him as a purple rag out of which he had made for himself a royal mantle." Zola sees in him the greatest of lyric poets, and would wish some pious friend to prune away the complete volumes in order to leave only a selection of the masterpieces, the works of absolute beauty; and this is a service which time is sure to effect even if no other hand should dare the deed. It is said that Victor Hugo will leave at his death at least twenty unpublished works which will be appearing at intervals determined by his will. Zola chooses to see in this fact the pride of a god who triumphs over death, and also the little faith Hugo has in the talent of his surviving disciples, preferring thus to carry on himself the combat of Romanticism from the tomb to leaving his memory to be defended by them. One can see by the continual effort to be just and to be respectful that it is no easy task for Zola to judge impartially of work so antagonistic to his own method. He cannot help chuckling over what he terms the ruins of the Romantic school, and again and again through this volume we are as-

sured that at the present hour the Naturalistic is the only school now existing in France, and that it has more surely triumphed over the Romantics than they did over the Classics in 1830.

In the article on Musset we have a subject more sympathetic to our author, treated therefore in all seriousness and just appreciation, without the insistence on foibles and the salt of satire which he so profusely lavishes on Victor Hugo. One hour of weakness he regrets in the life of his favorite poet—the one in which he sought the honor of becoming an Academician; and it would seem, by what he wrote on the subject, that even his brother must have felt something similar. Paul de Musset speaks thus of this event: "Among all the grave personages who surrounded him that day, at most ten may have read a few pages of his poetry. Lamartine publicly confessed he had not read his works. Others blamed them on hearsay without wishing to know them. The evening before the election, M. Ancelot, who particularly liked the candidate, and who was determined to give him his vote, said in the Palais-Royal Garden to the publisher Charpentier: 'That poor Alfred is an amiable youth and a charming man in society; but, between ourselves, he has never known, and never will know, how to write verses.'" The honor of such an election to a distinguished literary man is indeed questionable.

"Théophile Gautier may be judged in a phrase, if one says he was an admirable grammarian and an admirable painter. He carried with him as a gift his correct and richly picturesque style. A perfect page never cost him any effort." His conversation seems to have been even more picturesque and vivid than his writing, and many critics expatiate on the universality of his genius and the encyclopedic quality of his mind; but Zola objects that he brought no new thought, no human truth of any depth, no foreknowledge of the evolution of centuries—nothing but brilliant variations on a well-tuned instrument; and his judgment of Gautier is summed up in these words: "All the written or spoken words of this poet are dazzling gymnastics in the domain of paradox." Gautier objected to the coining of new words; he even tried to demonstrate by the force of his rhetoric that there was nothing new under the sun, not even steam locomotion, which he pretended was perfectly well known to Archimedes, but the Greeks disdained its use, finding that they went fast enough without it. He had the hatred of innovations in common with all the followers of Romanticism. One of Gautier's favorite ideas was to found a school of style in France that poets might be followers of Théophile Gautier or of Victor Hugo, just as painters sign themselves pupils of Gérôme or Cabanel, thus sacrificing everything to form, for which he was content to sink thought and actual, positive science. He must have cordially hated the modern dramas he had to sit in judgment upon, night after night, as dramatic critic of the *Moniteur;* and if he did not fight against the ever-pervading Naturalism, it was because he had become indifferent and dragged along his chain of daily work in the restricted frame, even allowing his articles to be altered to suit the paper for which he wrote. It was only when Victor Hugo, his revered master, was in question that he insisted on his opinions and threatened to give up the position.

Gautier seems in his later days to have regretted the amount of praise he had lavished on all sides so indiscriminately; yet he piqued himself on the infallibility of his judgments during thirty years of general artistic criticism. "Singular infallibility," justly remarks Zola, "which cries, 'I proclaimed Delacroix,' and dares to add, 'I placed Gérôme on the same level with him,' and which might still say, 'I found talent in all excepting in the Realists.'" A marvellous poet, second only to Hugo, and the finest prose writer of the first half of our century, Zola is willing to acknowledge Gautier to be; but he thinks the collecting together of all his feuilletons the worst service his friends can render to his memory. In the latest volume of 'Memoirs of Théophile Gautier,' by his son-in-law, M. Bergerat, we have a confirmation of the fact that Gautier loved neither his country nor the age in which he lived. This Zola finds common to the whole Romantic school. "Writers of 1830 held as a principle that we were ugly; that our times and our country were frightful to look at and to analyze. It was the disdain of modern things so long practised by the Classic school. Only, instead of taking us back to antiquity and making us live in Athens or Rome, the Romantic school transported us to the East, and locked us up in mediæval towns. I insist on this because it is extremely typical, and explains many things. Let us refer to the literary manifestoes of fifty years ago: what prevails in them is revolt against the present time." Further on he says: "The want of feathers and lace-braid condemned our society irredeemably in the eyes of the Romantic writers. The humdrum of life horrified them also. Money matters, commerce, cookery, all the details of daily life, were to them the sum total of ennui; they seemed to think past ages had not known these trifles. They required, in a word, times stripped of the realities of existence, ages so far removed that they might be resuscitated with a carnival of manners, language, and costume." "The Romantic writers have lived so short a time, and will soon disappear entirely, because they have neither understood nor loved their own age. This is their irreclaimable weakness. No other reason need be sought for the short life of this school, which has counted in its ranks such powerful rhetoricians and men so admirably endowed as to form."

The only work which will last and which suits our age is based on scientific study of our own times—on types of every-day life studied from nature, "the human document." "It is science, or rather the scientific spirit of our century, which offers the genial matter out of which the creators of to-morrow will produce these masterpieces." What the creators of to-morrow may accomplish, we know not, but we shall hope that they may arrive at some happier medium course than the Naturalistic writers of to-day, who, like Zola, seek the "human document" in repulsive types and loathsome pictures treated with but little art and much insistence of painful detail and truth to ugliness. The moral of these works is that vice brings its own punishment, and the demonstration of this hackneyed theme leads us through unsuspected and undesirable depths of wickedness. Zola is far more interesting as a critic than as a writer of fiction. His wish to be just, so frequently expressed, does not prevent him from writing freely of his contemporaries. In two distinct articles he passes in review the younger poets and the critics of the day, who all fall far short of the mark. It would indeed seem difficult to meet Zola's views in this line. He even considers Sainte-Beuve wanting as a critic, because he refused to regard with anything but consternation the work of Flaubert and the Goncourts. For a moment the hopes of the whole school were centred in Taine, but these soon faded before the severe geometrical and mechanical system which he applied to his criticism. So now the Naturalists are without any critic, and their work accordingly falls flat. M. Zola naïvely deplores this, and remarks that the public gets more and more exasperated and indignant at each fresh work, for want of some one to explain, so that it may understand, besides the strife and noise which is going on, the rights of the conflict, and on which side life, talent, and the future are. In another essay, on "Morality in Literature," Zola answers attacks on his own works. The book is throughout clever and amusing, full of lively argument and unfailing wit, however strained some of the points may be, and at variance with the reader's preconceived notions of art in literature.

FOOTE'S ANNALS OF KING'S CHAPEL.

Annals of King's Chapel, from the Puritan Age of New England to the Present Time. By Henry Wilder Foote. In two vols. Vol. i. Boston: Little, Brown & Co.

KING'S CHAPEL is one of Boston's most interesting landmarks, and with a single exception (Christ Church) is the oldest of her existing houses of worship. Its history is the history of the planting and growth of Episcopacy in New England, and abounds in stirring incidents; and although Mr. Foote is of Unitarian faith, he yet treats his subject so fairly and impartially that churchmen will not fail to regard this work as one of first authority. As we turn the leaves of the book we are surprised at the great store of material which has served the author in the preparation of it. The Massachusetts Historical Society's Collections, the *New England Historical and Genealogical Register*, Whitmore (through his Andros Tracts), Dr. Perry's Historical Papers, the Mathers, Sewall, Palfrey—these and many others have been freely drawn upon, and have enabled Mr. Foote to tell his readers something about almost everybody that was in any way connected with King's Chapel, and for every important fact to present an "authority." The church records, letters, and documents—some of them now for the first time printed—are indeed instructive, as showing the very "spirit of the times," for an example or a warning, as it may happen. Portraits, arms, autographs, and views of buildings most fittingly set off the pages of the book.

The principal agent in establishing the Church of England in Massachusetts was Edward Randolph, described by Cotton Mather as "a blasted wretch, followed with a sensible curse of God wherever he came—despised, abhorred, unprosperous." Randolph's first appearance in the colony was in the year 1676. In nine years, according to his own showing, he made eight voyages to New England, serving the King in the capacity of a police spy. Two objects he never concealed—the overthrowing of the Massachusetts charter, and the setting up of the Church of England in Boston. In both he was triumphant. He certainly worried the Puritans nearly to distraction. The people said he "went up and down seeking to devour them." In 1679 Randolph writes to the Governor of Plymouth: "I am received in Boston more like a spy than one of his Majesty's servants. They kept a day of thanks for the return of their agents, but they have prepared a welcome for me by a paper of scandalous verses, of which I take the more notice because it so much reflects on my master, who will not forget it." In a letter to the Lords of the Committee of Trade he says: "I am by all accounted the sole enemy of the country"; and after the Revolution, he writes from Boston Jail to the Governor of Barbadoes: "All the blame lies upon me, who first attacked and then overthrew their charter, and was made the officer to continue their Egyptian bondage by my office of collector." In 1683, when Randolph came to Boston with the writ of *quo warranto* against the Massachusetts charter, a destructive fire happening to break out in the town, the peo-

ple, in their rage, insinuated that he was the incendiary.

The frigate *Rose* arrived at Boston on the 15th of May, 1686, bringing Mr. Randolph and the Rev. Robert Ratcliffe, a minister of the Church of England. Soon afterward a request was made to the Council that Mr. Ratcliffe might have the use of one of the Congregational meeting-houses of the town; which being denied, "I got," says Randolph, "a little room in their Town-house for such as were of the Church of England to assemble in." And in the Boston Town-house, on the 15th of June, 1686, the first Episcopal church in New England was duly organized. Sir Edmund Andros, commissioned by King James II. to be the Governor of New England, landed at Boston on the 20th of the following December. One of the first "acts of his despotism" was the taking possession of the South Congregational meeting-house for the use of the Episcopalians. Dr. Greenwood (the author of 'A History of King's Chapel,' published in 1833) considers this to be "one of the most arbitrary acts ever perpetrated in this country while it remained under the English Government." "No excuse," he adds, "is to be rendered for it. It was such a deliberate outrage on the common rights of property, to say nothing of conscience and liberty, that we may only wonder that Andros and his abettors, of whom Randolph was doubtless one, suffered no personal violence from the people." The two congregations occupied the "South" by turns—the Episcopalians in the forenoon, and the Congregationalists in the afternoon, or according as it was more convenient for the Governor. On one occasion, when the Episcopal service had lasted until after two o'clock, Judge Sewall notes in his Diary: "It was a sad sight to see how full the street was of people gazing and moving to and fro, because they had not entrance into the house."

Another of Sir Edmund's "acts" was the appointment of Randolph to be the licenser of the press. Under his "licensing," one almanac, one proclamation by Andros, and five reprints constituted the entire issue of the Boston and Cambridge presses for the year 1688. The restraint upon marriage was more "grievous" than that upon the press, none being allowed to marry unless they gave bonds with sureties to the Governor, to be forfeited in case of lawful impediments afterward appearing. Andros regarded the Congregational ministers as mere laymen, and Randolph wrote to the Bishop of London: "One thing will mainly help, when no marriages hereafter shall be allowed lawful but such as are made by the ministers of the Church of England." At that time Mr. Ratcliffe was the only Episcopal minister in the country. Cotton Mather, in his 'Remarkables' of his father, furnishes the following graphic description of the Andros "administration":

"The Administration was almost entirely a complication of shameless and matchless villainies. The honest gentlemen in the Council were overlooked and browbeaten and rendered insignificant. Three or four finished villains did what they pleased. There was no controlling of them. Among other instances of the vile things in it there was this comprehensive one: The banditti gave out that the charters being lost, all the title that the people had unto their lands was lost with them (for which a small defect in the legal and public settlements of them was pretended), and therefore they began to compel the people everywhere to take patents for their lands. Accordingly, Writs of Intrusion were issued out against the chief gentlemen of the Territory, by the terror whereof many were driven to petition for patents, that they might enjoy the lands which had been fifty or sixty years in their possession. But for these patents there were such exorbitant prices demanded that fifty pounds could not purchase for its owner an estate not worth two hundred; nor could all the money and movables in the Territory have defrayed the charges of patenting the lands at the hands of these crocodiles, besides the considerable Quitrents for the King. Indeed, the brutish things done by these wild beasts of the earth are too many to be related, and would be too brutish to be believed."

An "administration" such as Dr. Mather has described was not to be endured by a liberty-loving people, "essentially the same in 1689 that they were in 1775." On the 18th of April, 1689, they broke out in open revolution, captured the forts, and imprisoned Andros, Randolph, and the prominent members of Mr. Ratcliffe's church. The most obnoxious ones were kept in prison some months, and then, by order of the King, were sent over to England. It does not appear that Mr. Ratcliffe was restrained of his liberty. He went to England shortly after the deposition of Andros, and never returned.

About six months before the downfall of Andros the Episcopalians commenced the erection of a building—the King's Chapel—for their own exclusive use, taking for its site a part of the plot set off by the first settlers for a burying-ground. The structure was so far completed as to be in condition for occupancy in June, 1689, but was not pewed until 1694. It was of wood, and was built at a cost of £284 16*s*. In Queen Anne's reign it was styled the Queen's Chapel, but on the accession of George I. it resumed its old name of King's Chapel. Mr. Ratcliffe was succeeded in the rectorship of the church by Rev. Samuel Myles, "a good liver and a painful preacher," though vexed with a "fiery temper." Mr. Myles's work in the affairs of his church lasted almost forty years. In 1692 he made a visit to England, and for four years was absent from his congregation, his pulpit being filled by Mr. Smith for one year, and by Mr. George Hatton for three years. Little is known of Mr. Smith, but of Mr. Hatton we have the notice following from Captain Thomas Coram, in his petition to the Archbishop of Canterbury:

"In the years 1693 and 1694, and some time after, there was but one minister of the Church of England in all the inhabited parts of the English Empire in America. . . . The said minister, whose name was Mr. Hatton, was a very worthless man. He resided at Boston, and was utterly unfit to gain or reconcile to the Church such Dissenters so strongly inveterate against it. But he was far from ever attempting to do so; for he would frequently on Saturday nights sit up and play at cards all or the greater part of the night, in company with an Irish butcher and an Irish barber and another or more of such of his acquaintance, whereby he was usually so much disordered, which prevented him from officiating next day at Church, which gave its numerous enemies great opportunity to ridicule against it; and those few inhabitants of the large town of Boston who were desirous to go to Church were very often disappointed and greatly discouraged."

Captain Coram is mentioned in the Province laws as a "shipwright of Boston." He was a noted philanthropist, and the projector of the Foundling Hospital in London. It is suggested that he was not an unprejudiced witness, because of a grievance of his own with the vestry of King's Chapel, arising out of a gift of land he had made to the church, which had been treated in a somewhat contemptuous manner.

Mr. Myles returned in 1696, with abundant gifts in hand for his church and the promise from the King of £100 a year for the support of an assistant. The "new worship" was now securely established, and but for "internal strifes" its history would not be long-spun. The relations between the rector and his assistants were singularly unhappy. Mr. Bridge was the first to fill the position of assistant. Mr. Myles charged him with "falsehood and dissimulation," and their dissensions ended only when Mr. Bridge was removed to the Narragansett country. Mr. Harris (in 1709) took the place vacated by Mr. Bridge, bringing causes of more trouble, or perhaps finding them already prepared for him. And still the church increased in numbers. Christ Church, in the north part of the town, was built in 1723, Dr. Cutler, a new convert to the faith, becoming its rector. In any differences between the rector and assistant of King's Chapel, Dr. Cutler always sided with the rector. "Mr. Harris," so writes Dr. Cutler, "is a sore mortification to us in every good design. . . . That person refused reading prayers but last Sunday for Mr. Myles, who is greatly indisposed; and this is but one out of a thousand beastlinesses of the man." And again: "Mr. Harris's conduct ever since [Mr. Myles's death] has been a dreadful tragedy. . . . Being displeased at a gentleman of character belonging to the church and vestry, he pulled him by the nose, and bad him get out of the church, and said he would follow him; and, after that, charged him with going to strike him in the church, whereas every one there were witnesses to that gentleman's meek behavior." The "feuds within" King's Chapel were not confined to its clergymen, but, as showing the estimation in which the two were held by their flock, it is set down that when Mr. Myles died (1728) the church paid £194 for his funeral, and that upon Mr. Harris's death (1729) the congregation, by a solemn vote, declared that no money should be paid out of the church funds for his burial.

An enlargement of King's Chapel to twice its original size was made in 1710. In a description of Boston printed shortly afterward we find this mention of the building:

"Here is the Episcopal Church, handsomely built and adorned, whose congregation is said to consist of about a thousand members. King William and Queen Mary gave them a pulpit-cloth, a cushion, a rich set of plate for the communion-table, and a piece of painting reaching from the bottom to the top of the east end of the church, containing the Decalogue, the Lord's Prayer, and the Apostles' Creed. Thomas Brattle, Esq., gave a pair of organs to it, and there's a magnificent pew, built at the public charge, for the reception of the Governor, when he happens to be of the Church of England."

The next rector of King's Chapel following Mr. Myles was Rev. Roger Price, who held also the appointment of "commissary," by which he was required to keep an oversight of the other Episcopal churches in New England. His assistant for six years was Rev. Thomas Harward, between whom and the rector there were many unpleasant "disagreements." "Mr. Price's ministry," says Mr. Foote, "is marked by two controversies—first, with the Provincial authorities in his capacity as commissary, and also, personally, with his own people." These controversies make a highly interesting chapter in the 'Annals.' The disagreements and controversies seem not to have affected the church injuriously, for its membership had so largely increased in 1735 that there was need of further accommodation, and it was to meet this need that Trinity Church was built, Mr. Davenport (Mr. Price's assistant for a short time) becoming its rector.

The "Great Awakening," as it has been termed, under the leading of Whitefield and Tennent, occurred in Mr. Price's time. It was not regarded with favor by the Episcopalians. Mr. Price wrote and preached against it, as also did Dr. Cutler. The letters of the latter are very peppery. He calls Mr. Whitefield a "fellow," and Congregational churches "conventicles," and is yet more unreasonable when he comes to Mr. Tennent. These are his words:

"After him [Whitefield] came one *Tennent*—a monster! impudent and noisy—and told them all they were damn'd, damn'd, damn'd. This charmed them; and, in the most dreadful winter I ever saw, people wallowed in the snow, night and day, for the benefit of his beastly brayings, and many ended their days under these fatigues. Both of them carried more

money out of these parts than the poor could be thankful for."

Mr. Price severed his connection with King's Chapel by resignation. His people seem to have been not unwilling to let him go. In looking for his successor they took a "new departure," voting not to send to England for a minister, but to choose one from among the clergy in New England. Following this vote, the congregation made choice of the Rev. Henry Caner, of Fairfield, Conn. And here the historian takes leave of us for the present. The second volume, however, already well forwarded, will contain an account of the building of the Stone Chapel, the troubles through which the church passed in the years of the Revolutionary War, and the movement by which "the first Episcopal church in New England became the first Unitarian church in America."

AN ANTHROPOLOGIST ON THE IRISH QUESTION.

Our Nationalities. By Jas. Bonwick, F.R.G.S. New York: Scribner & Welford.

Mr. Bonwick's volume is divided into four parts, in which he inquires into the nationality of the Irish, the Scotch, the Welsh, and the English. It appears from the introduction that the motive for these inquiries is almost as much political as ethnological. The Irish present many traits which are a constant puzzle, not only to Englishmen, but to the rest of the world as well. Their passionate attachment to their country is curiously contrasted with the readiness with which they adapt themselves, when compelled to emigrate, to life in countries alien in religion, race, and institutions; their apparent, or, at any rate, assumed incapacity for self-government is hard to reconcile with the fact that in a democratic country like America they should for a long time have seemed destined to take complete possession of the machinery of municipal government. Their hard-headed shrewdness and humor in private life offer a curious contrast to the unbridled romance and enthusiasm they seem still ready to display in politics at the bidding of leaders as ill-fitted as any that have ever appeared in the world's history to inspire such feelings. In literature and on the stage they always appear gifted with the most attractive virtues that a high state of civilization can produce, while in public life they seem to most people inspired by some demoniac fury which they cannot resist, but which inevitably leads them to certain disaster. Without going into the merits of the questions discussed by Mr. Bonwick as to the Celtic race, it may certainly be said that the passionate and, to outsiders, irrational devotion to country which Irishmen display seems almost to be different in kind from patriotism as we know it in other countries of Western Europe, except France, where, however, it does not attract nearly as much attention, because France has not had in modern times to submit to a foreign yoke. It is the preservation of this intense national feeling among a people long since incorporated into another empire which is so remarkable. To compare the feeling of Irishmen toward England with that of Poland toward Russia is of course absurd, for the government of Poland by Russia was an organized system of cruel oppression, and Polish patriotism was inflamed by a sense of daily misery arising from the burden of a despotism which stifled all free life; but if Ireland were a real Poland, it would be difficult to imagine an intenser sentiment of detestation than that inspired by the Saxon oppressor.

It is important to bear this fact in mind in reading Mr. Bonwick's volume. Some idea of his method and motives may be gathered from his introduction, which opens with the incontrovertible statement that the cry of "Ireland for the Irish" suggests the inquiry, "Who are the Irish?" The question is, he says, obviously one either of birth or blood. In the former case, the son of Irish parents, if born while his mother was visiting England, would be no Irishman; while the son of English parents, fortuitously born in Ireland, would be one—a palpable absurdity. On the other hand, if we apply the test of blood, we are confronted by some awkward difficulties. Were the Home Rule theory reduced to practice, "a vast number of comfortable officials would have, on that principle, to retire in England"—*i.e.*, Irishmen now connected with the English Government. "Who then," Mr. Bonwick somewhat ironically asks, "would cease to rule in Ireland?" On the other hand, if reputed Scotch and English were to be excluded from state affairs in Ireland, and the origin be decided by names, "nearly all the prominent Irish leaders would be immediately retired, since they clearly belong to that hated race that conquered Ireland." Proceeding with the work of ostracism from power, Ulster, Leinster, Munster, and Connaught would have to be purged of Scotch and Welsh as well as English, whether of Celtic, Saxon, Norwegian, Flemish, or Danish origin. Besides these, "the Danes proper" must be dealt with, and here the trouble arises that a large number of these, as well as of the early Anglo-Norman colonists, assumed Irish names and the Irish tongue, so that "it would be puzzling to get rid of those defilements of the pure Irish." But even with these defilements effaced, the work of selection is not completed, for "the small remnant would have a rare contest over the spoils of office." There would be "the big-boned and fair-haired Celts" claiming the rights of rule, but their claim would be resisted as that of mere devastating intruders by "the little dark-eyed people of an older date," and even these might in their turn be shown to be intruders.

This still leaves us face to face with the original question, Who are the Irish who ought to govern Ireland? The author's answer to this question is somewhat vague—indeed, he leaves it unanswered. Ireland, he says, was the ancient refuge of the oppressed. Just as people now emigrate from countries oppressed by misrule to the United States, so in early times they found shelter in Ireland. "It was the last north-western shore. They crowded in upon one another, being, as it were, in ethnological strata." There was this difference, however, that emigrants to Ireland in primitive times were not invited to come and were not received gladly. In fact, they were received with such marked demonstrations of disapproval on the part of the natives that they only got a foothold for their own ethnological stratum, by fighting with the previous stratum and getting the better of it. In this way, Mr. Bonwick, who is an out-and-out Darwinian, says, "each successive set of arrivals had to illustrate the doctrine of the survival of the fittest." This shows to his mind the absurdity of talking about Ireland as a Celtic country. It is inhabited by a greater mixture of races than any country in Europe. As well might we call France Roman because the older language was surrendered for Latin. But even if it were true that the Irish were all Celts, says Mr. Bonwick, is it reasonable to hate or despise another merely because God "gave him a different racial parentage"? The anthropologist would unhesitatingly say no. But if this is the answer furnished by anthropology, how wrong, politically, is it "for any man, for party purposes, to foster such a feeling among those in one national bond!" Religious zealots insist that Catholics are Celts, and Protestants are Saxons, and "one object of this little book is to show that the Catholics of Ireland are far from being all Celts, and Protestants far from being all Saxons." It may, the author admits, fail to convince "prejudiced adults," but the rising generation at least will learn that the English and Irish are very nearly related, and that, in fact, "most Irish came originally from Britain."

It will be seen from the foregoing how closely anthropology and politics are connected in the mind of our author. The Irish land agitation, he says, can be shown to have arisen "in consequence of old tribal customs," existing perhaps before the Celtic period, and is consequently "a remarkable case of *Survival*." The Saxons came to Ireland, too, after the establishment of the tribal system, and both alike have clung to the old habits of the country—a fact at which "the anthropologist smiles," as another illustration of *survival*. We cannot go into the details of the inquiry contained in the body of the volume; but no one can examine them without profiting by the author's research and learning. If we had a criticism to make, it would be that Mr. Bonwick overestimates the reader's sense of humor. In his account of the early settlers in Ireland it is often difficult to make out whether he is treating us to jocular or serious anthropology. He does not sufficiently discriminate between what he believes and what he does not believe of the early Irish legend to permit the reader to know exactly what is science and what is myth. His serious anthropology is marked by a liberal and almost lavish hospitality of belief, and for this reason it is to be regretted that he has allowed his humor such liberties with it. Anthropology is clearly not at the bottom of the following:

"When that worthy man, Milesius, who was said to have kept a school near the Tower of Babel, teaching Hebrew and *Irish* there, came over to Ireland, he found Somebody there before him. When Noah's niece, hearing of a coming Deluge, indulged a woman's fears in running away beforehand, she very naturally got to the end of the world, in Ireland. She had, as reported, a retinue of three men, but old chroniclers had too much contempt for women to tell us of her lady companions. Those who doubt the universality of the Deluge have thus a famous argument on their side; since if the Irish had all been drowned at the Deluge, how should we know anything about Cesarea, the niece of Noah?"

But he does not hesitate to go behind even Milesius and Noah's niece:

"We know that there was a very uncomfortable state of things once in Northern Europe, called the *Glacial Age*. Then all Scotland and the greater part of Ireland and England looked just like [*sic*] Greenland does now. But that was before Erin was the *Green Isle*, and when the vegetarian system would have had considerable difficulties to encounter, since modern Esquimaux have to do without bread, cornflour, potatoes, and jellies. Yet, as men did exist in Britain before the glaciers retreated nearer the North Pole, one wonders what sort of creatures the *Glacial* Irish were, and whether temperament has changed with temperature."

As we have already said, the anthropological researches of Mr. Bonwick do not throw much light on the political question on which he suggests their having a bearing in his preface. That the Irish were a composite race we knew already. A knowledge of the exact amount of Celtic blood in their veins, or the exact amount of Saxon blood in the veins of the English, would throw about the same light on the question of Home Rule as the dispute about the "Latin races" did on the durability of the Second Empire in France or the balance of power in Europe. If it could be proved that the Irish were entirely Celtic, we should not know much more about the proper treatment for Parnell than we do now. Consequently, Mr. Bonwick's compendium—for it seems rather a

compilation than an original work—cannot have any political value, except, indeed, that it does show how very difficult it would be for any one to attempt a final settlement of the Irish question by anthropological means.

Freaks and Marvels of Plant Life; or, Curiosities of Vegetation. By M. C. Cooke, A. M., LL. D. Published by the Society for Promoting Christian Knowledge; pp. 463, 12mo.

BULKY though it be, this is a very *thin* book, and one that does little credit either to the respectable and well-meaning society which issues it, or to the well-known cryptogamic botanist who has brought good, bad, and indifferent materials together. He might have written a book on the Curiosities of Fungi from fulness of knowledge. But, although "the prominent features in the investigations which have of late years contributed so much to our knowledge of vegetable life" are really well worth "presenting in a popular form," and it may be that "the labors especially of Mr. Darwin in this direction deserve to be more generally known than they are," one may still doubt whether the endeavor to make them so should not have been left to a more competent and discriminating expositor. Altogether this is a bookmaker's "Freak."

Elementary Lessons in Electricity and Magnetism. By Prof. Silvanus Thompson, of University College, Bristol, England. London and New York: Macmillan & Co. 1881.

THE reader will find this treatise a very convenient book of reference for a multitude of facts in electrical science. In the author's anxiety to include the latest developments of the subject, he has not exercised, at all times, his scientific caution. Evaporation is mentioned as the source of atmospheric electricity; the existence of electrical currents in muscles and nerves is alleged, without reservation; and in speaking of the influence of temperature upon the magnetic state, the influence of the temperature at which the iron or steel is magnetized is not given. The writer, however, is fairly abreast with the times, and the book is a valuable one for the young student.

A BIOGRAPHY OF

The late Leonard Bacon

Seems to be called for by the many grateful and appreciative notices of his life which have recently appeared. Aid in preparing the work is earnestly asked of any persons who may have in their possession letters or other documents which can be of use. Such documents will be carefully preserved and returned if desired. They may be sent to the Misses BACON 247 Church Street, New Haven, Conn.

The Edition de Luxe

OF

Shakespeare.

WITH OVER 800 ILLUSTRATIONS BY

SIR JOHN GILBERT, R.A.

The Text chosen is that of Mr. Howard Staunton.

"*Certainly one of the best Texts we have.*"—Athenæum, March 12, 1881.

This edition, which is undoubtedly the finest that has ever been offered to the public, is now completed, the fifteen volumes in which it is issued having followed one another in as quick succession as was possible consistent with the very careful work that was necessary on a book which required the greatest skill on the part of the printer in order to do proper justice to both text and illustrations.

It is printed in large, clear, new type (larger than is used in any edition extant), on a paper of the very finest quality made especially for this work.

The illustrations, by Sir John[illegible] R.A., without doubt the finest draughts[illegible] wood of his time, are printed from the original wood blocks on real China paper, and mounted in the text.

For the frontispiece there is a new and very fine portrait of Shakespeare, drawn especially for this edition by Sir John Gilbert.

The size of the volumes is imperial octavo; the binding is plain, and the size of the margins will allow of rebinding in any style to suit the purchaser.

"A few months ago we drew attention to an illustrated edition of Shakespeare, which promised to take rank among the most imposing of those *éditions de luxe* with which the enterprise of English publishers has enriched our libraries. That promise has been quickly fulfilled. The fifteen volumes are now complete, and the publication is one which, for the excellence of the engravings and the beauty of the typography, any library may be proud to possess. . . . The printer has done his part to make the edition perfect. The text, and the fruits of the late Mr. Staunton's labors as an editor, are presented in a form that leaves nothing to be desired."—*The Times.*

"The printing of this edition is peculiarly clear and brilliant, from a very fine fount of type. The paper suits an *édition de luxe;* it is solid and not hot-pressed. It is with Sir J. Gilbert's illustrations that we are most concerned. Illustrated editions of books are usually divided into three classes—(1) those in which the cuts are intolerable; (2) those in which they are tolerable, and serve well as mile-posts in the wilderness of type; (3) those in which the cuts are excellent, if not admirable. It is in the third class that we should place the publication before us, on account of the invariable spirit and occasional beauty of the designs. They have the energy and stately grace, the humor and variety which the plays demand; and they further possess just so much of stage inspiration and theatrical characteristics as befits compositions adapted to plays."—*The Athenæum.*

"To ascertain how excellent the drawings are at their best, one has only to turn to the *Thersites* of 'Troilus and Cressida,' to the Egyptian slave who brings the 'worm' to *Cleopatra*, to the sinister face of *Aaron* amid the horrors of 'Titus Andronicus,' or to any one of a host of similar characters. On the other hand, *Dercetas*, with the sword of *Antony*, in 'Antony and Cleopatra,' is a successful study of the more heroic type. It seems to breathe the very spirit of the speech with which *Dercetas* appears before *Octavius.*"—*The Times.*

This edition has been limited to 1,000 copies, all of which are numbered, and as the type has been distributed on the completion of each volume, there will be no possible chance of securing a copy as soon as the 1,000 are sold.

Terms can be obtained from all the principal booksellers, or from the Publishers themselves, who will send specimen pages free on application. Price per vol., $10 00.

GEORGE ROUTLEDGE & SONS,
London, and 9 Lafayette Place, New York.

A. C. ARMSTRONG & SON

HAVE JUST PUBLISHED:

UNIFORM WITH THE STANDARD EDITIONS OF HALLAM, LAMB, MILMAN, AND DISRAELI'S WORKS.

A New and Superior Library Edition

OF

History of the Peninsular War,

And in the South of France from the Year 1807 to 1814. By General Napier. (From the Author's last Revised Edition.) With 55 Maps and Plans of Battles, 5 Steel Portraits, and a complete Index, elegantly printed on toned paper, strongly bound in extra cloth.

PRICE, $7 50 PER SET (reduced from $12 50.)

"*It is creditable alike to Napier and to the American people that in this country the 'History of the Peninsular War' has PASSED THROUGH SEVERAL EDITIONS, THE ONE BEFORE US BEING UNQUESTIONABLY THE HANDSOMEST AND THE MOST COMPLETE. To the student of history—especially to him who loves to dwell on the romantic character of Portugal and Spain—the marches, sieges, and battles of Wellington's armies during six long years must always possess an interest which neither the Crimean War nor the late great struggle in this country can altogether efface. Napier's History is THE MOST FAITHFUL AND THE MOST COMPETENT AUTHORITY TO BE FOUND IN ANY AGE OR IN ANY COUNTRY.*"

At Home in Fiji.

By C. F. Gordon Cumming. Map and full-page illustrations. 1 vol. crown 8vo, $1 75.

"The matter and manner of this work, its facts and fine descriptions, intermingled in rare good judgment with incidents and personals, make it one of unusual interest to the cultivated reader. The book is interesting in every chapter, and of more than usual value for its historical facts."—*Chicago Inter-Ocean.*

Liverpool *Mail:* "Miss Gordon Cumming and Miss Bird are, perhaps, the most delightful lady travellers of the day."

TWO NEW VOLUMES OF THE SERIES OF

Heroes of Christian History.

Printed by the *Evening Post* Job Printing Office, N. Y.

The Nation.

NEW YORK, THURSDAY, MARCH 23, 1882.

The Week.

DURING the week there was no gold exported, but near the close the rates for foreign exchange again approached the gold-shipping point. The New York banks gained $2,465,475 in reserve, and ran their surplus up to $3,153,300. This gain came chiefly from Treasury disbursements on account of bond redemptions. Of the $60,000,000 of 3½ per cent. bonds covered by the 105th, 106th, and 107th calls only $8,309,400 remain unpaid. The 108th call for $20,000,000 matures April 8, and no order for the prepayment of these bonds without rebate has yet been issued. Early in the week the 109th call for $15,000,000 of the 3½ per cent. (extended 6s) bonds was issued, to mature $5,000,000 on each of the first three Wednesdays of May. At the Stock Exchange the week has been remarkable. There was a complete change in the tone of the speculation in stocks from depression and weakness to strength and buoyancy; the advance in prices of the leading stocks ranged from 1 to 11 points; United States bonds advanced ¼@¾, and railroad bonds 1@7 points. This change was brought about mainly by a combination of the wealthiest speculative railroad managers, who agreed to unite for the common defence, in the market, of the stocks of their respective properties against the attacks of another class of speculators, of large but inferior means, who have been "raiding" stocks for many weeks. The existence of the combination was revealed to the public, first by the display of securities by Jay Gould, which was alluded to in our last issue, and, second, by a series of published statements in the daily papers. The most important of these statements was that of Mr. William H. Vanderbilt, to the effect that the railroad war on both passenger and freight rates was practically settled, and that a pooling arrangement for five years had been made. His declaration and Gould's display were supported by their orders to buy their leading stocks; they raising the buying price on each succeeding day and taking all the stock offered on each day at the appointed price. In this way, the confidence of dealers in stocks that the market could no longer be successfully attacked induced general speculative buying, and as prices are low for many stocks, the investing public late in the week came in as buyers, as did also to a moderate extent the foreign markets.

Nothing could have more clearly demonstrated the utter absence of efficient leadership among the Republican majority of the House of Representatives than their caucus on Wednesday week. Mr. Robeson, who presided, probably thought it useless, after the experiences he has gone through, to make on his part any attempt in that direction. All he had to say in opening the meeting was that it would be a good thing for the Republican party to have some policy or other, and that suggestions in that respect were now in order. A considerable number of such suggestions followed, touching a variety of things, but nobody spoke with any weight of authority. There were no formal votes taken upon any of the resolutions; but after a great confusion of tongues the caucus finally arrived at what is called "a general understanding" concerning several points of importance, and it may be said that it thus brought forth results of value. In the first place, it appeared that a large majority of the Republican members of the House were opposed to the repeal or reduction of the taxes on whiskey and tobacco. Mr. Kelley of Pennsylvania produced the well-known arguments of the protectionists in favor of the repeal in his usual sonorous style, but found the current of opinion so strongly against him that, while deprecating a formal vote, he found himself obliged to "acquiesce heartily in what appeared to be the prevailing sense of the caucus, and was willing to abide by it." This being the sense of the caucus, it may now be considered as certain that the taxes on whiskey and tobacco will not be interfered with, while the field is open for the repeal or reduction of other internal taxes, such as those on matches, bank-checks and circulation, etc. The second point of the "general understanding" was that the Committee on Rules should not bring up the proposed amendments to the rules until the Ways and Means Committee had made an effort to reach the consideration of the Tariff Commission Bill.

The House of Representatives on Monday resolved, by a vote of 152 to 56, to suspend the rules and to take up the Tariff Commission Bill out of the regular order as soon as the House went again into Committee of the Whole. Only appropriation bills are to be permitted to interfere with this arrangement. It is scarcely necessary to say that the heavy majority by which this was done cannot be looked upon as a test of the position of members with regard to the bill itself. By this vote two things have been accomplished: First, the "obstruction of the public business" which the Republican members of the Committee on Rules expected to occur on this very occasion, and to justify an amendment of the rules enlarging the powers of the majority, has failed to appear. The amendment of the rules will, therefore, lack this dramatic demonstration of its necessity, and may possibly have to be indefinitely postponed. In the second place, the debate on the tariff question is now certain to come. According to Mr. Kasson's prediction, it will occupy about a fortnight, and it seems to be generally understood that amendments will to any extent be permitted to be offered and to be voted upon. Now, we hope it will be a real debate, with attack and defence, one argument answering another, and not a succession of dreary lectures read from manuscript to a drowsy House and unfit to attract the attention of the country. Such a debate may be called forth by a motion, as an amendment to the bill, to instruct the Commission in the sense proposed by Mr. Hewitt in a substitute intended to be offered by him for the Commission Bill. The discussion should take the widest range, drawing every phase of the question within its scope, and it is particularly desirable that the relation between wages and the tariff—or in other words, the pretence that the tariff protects "American labor" and "the American laborer"—should be thoroughly ventilated. It is of less importance what the fate of this bill may be than that the public interest in the subject be revived by a thorough discussion of it.

The Investigating Committee of the House will doubtless perceive without difficulty that Mr. Morton's explanation, transmitted by Mr. Frelinghuysen, does not clear the Peruvian matter up, and that it is hardly likely to be cleared up either by letter or telegram. For instance, when Mr. Morton says that he "has never at any time been associated with any business transactions needing or expecting the intervention of the United States," he has evidently forgotten the clause of the Crédit Industriel contract with the house of Morton, Bliss & Co., which makes its continuance beyond the period of six years depend on the mediation of the United States between Chili, Peru, and Bolivia so as "to secure peace, and the recognition of the concessions, rights, and privileges granted to and secured by the contract above mentioned." So also, although it is true that "the preliminaries of the agreement itself were," as Mr. Morton says, "made by Mr. George Bliss in Mr. Morton's absence, and before his departure for his present post," this is a matter of no consequence. The question the Committee needs to have answered is, not whether the agreement was made in Mr. Morton's "absence"—for absence may mean simply that he was in Washington or Newport when it was made in New York—but whether it was made without his knowledge. It is to be observed, too, that we knew already that it was "made before his departure for his present post." But it was not made before his appointment to his present post. He was appointed on the 9th of March, 1881, and the contract was not closed until August 9, 1881, Suarez having announced his intention to make such a contract with a "first-class American house" in February, 1881. The contract as we have said, was signed on the 27th of August, and Mr. Morton was then in Paris, for he had his interview with President Grévy about Chili and Peru on the 10th of August, and his despatch reporting it is dated the 11th of August. He sailed from New York on the 20th of July, and probably reached his post about the 1st of August We trust Mr. Morton will see on reflection that his statement, that "it never entered into his mind that it would be possible to use or attempt to use his official position as Minister to further the object of the late contracts," is not a sufficient withdrawal of his case from the rule which forbids a diplomatist from entering into any contract likely to create the slightest sus-

picion of his using his official position for commercial purposes. It is not enough that he keeps his mind in the right condition : his acts also must conform to the law.

Mr. Vanderbilt, in an interview published by the *Tribune*, has informed the public why he is opposed to the creation of a railroad commission by law. His point is that such a commission would at once proceed to "compel the New York Central to take its local business on the basis of its through-rates; the Erie and the Pennsylvania Railroads would quickly make such through-rates as would just about ruin the Central, hampered with such a law ; those roads, as far as they did a business falling within the provisions of the law, would overcome their difficulties by their freedom in other States, while the Central, being entirely within the State, would have no chance to show effective opposition." Hence, Mr. Vanderbilt argues, such a commission would be ruinously unjust to the Central, unless the neighboring States had railroad commissions too, treating their roads in the same way. Mr. Vanderbilt is fighting a windmill. What reason has he to assume that the Railroad Commission will at once "compel the railroads of this State to take their local business on the basis of their through-rates"? Such things were indeed seriously contemplated in the early stages of the Granger movement, and there may be still an enthusiastic orator here and there ventilating similar crude notions. But it may be assumed that the Railroad Commission would be composed of men of good sense, informed enough to know that a railroad cannot carry a ton of freight one mile at the same rate per mile at which it can carry it 100 miles. Massachusetts has had a railroad commission for many years ; and when were the railroads of that State "compelled" to run their local traffic upon the basis of their through-rates ? Neither does the bill now before the Legislature confer any such power. It is, indeed, intended, and is also very desirable, that the Commission should look into the matter of special contracts and other unjust arrangements discriminating in favor of one business firm or one locality as against another, and into similar abuses, if they exist.

The announcement that nothing is expected to come of the approaching adjourned meeting of the International Monetary Conference, and that it will probably only assemble to adjourn again, will take no calm observer by surprise. Nobody who was not carried away by that mysterious force, the bi-metallic fever, ever supposed that it would. It is useless now to go over the reasons for this collapse. They have often been produced in our columns. Within the last year, a fresh one has been added in the shape of the total failure of the bi-metallic predictions about the terrible struggle for gold between the great commercial nations. It is apparently no more severe than it has ever been ; interest is low at all the great monetary centres, while speculation is rampant, and silver even in silver countries is piled up in vaults.

"The United Trade and Labor Union of New York City and its Vicinity," which has just been formed out of various smaller organizations, and held its first meeting on Sunday, does not seem after all to be a very practical body. It spent most of its time at this meeting over the question of convict labor, which of all the obstacles to the prosperity of the workingman in this State is probably the very least, though there is doubtless a good deal of merit in the suggestion that criminals should be compelled to supply the articles they need for their own use, but that the State should not try to make money out of them. But its value is derived rather from the demoralization which seems inseparable from the contract system than from the competition with free labor. There is no good reason why a convict should not be made to do in confinement what he ought to have done when at liberty—produce something for sale by his labor. It is about as absurd to complain of the competition of men in jail for crime, as of the competition of bad men out of jail. Nothing releases a man from the duty of labor, and the State has no right to keep a healthy man from laboring, or to enforce idleness as a punishment, or to destroy useful commodities because the maker of them was a convict.

The meeting passed characteristically from convict labor to Mr. Lowell's "inactivity and cowardice" in dealing with the Irish "dungeon" trouble, and the President was requested to remove him at once. Curiously enough, no American Minister in London has ever got Irish Americans out of their dungeons in Ireland fast enough. All the Ministers have been "cowardly and inactive," probably because they felt we were not ready to back up their representations with war. But this excuse is rapidly passing away, for Professor Mezzerhoff, of this city, a Russian chemist, offers to destroy an $11,000,000 British man-of-war for $150, or to go to London, Paris, Berlin, Constantinople, or St. Petersburg, with twenty men, each carrying "an ordinary satchel," and in twenty-four hours destroy the city. It is consequently not necessary to speak timidly to Lord Granville about Irish dungeons, or allow any "rotting" to go on in them, because we appear to have no ironclad navy. We have Professor Mezzerhoff, and large numbers of men willing to go to any leading European capital with an ordinary satchel.

Of the several steamship subsidy bills before Congress the one to which Representative Money has given his name has been selected to be pushed through the Senate, if possible, as an amendment to the Post-office Appropriation Bill now before that body. It has, however, been ruled out of order. It grants $2,500,000 a year for the encouragement of American shipping. Ten years' contracts are to be made for foreign mail service, "after sixty days' advertisement, with the lowest bidders." As the ships must be American-built, it is hard to see where the "bidders" are to come from, unless they bid for merely paper ships sailing upon a paper ocean. There is only one line which could get ready to perform the contract, even in part, in sixty days —the "infant industry" of Philadelphia, which has just been turned off by its railroad foster-mother to shift for itself. If that line is prepared to do the work, it will receive, should this bill become a law, "three dollars per mile for each outward-bound voyage"—say $9,000 a trip to Liverpool. If weekly trips should be made, the company would get $468,000 a year. This amounts to a guarantee of between nine and ten per cent. on a capital of five millions. Perhaps men could be hired to float the flag for this money, but no genuine revival of our foreign carrying-trade can be effected in this way. The fundamental condition of business success is lacking—the capacity of the business to support itself.

Rossi, the tragedian, has been interviewed at Philadelphia with regard to the condition of the dramatic art in this country, and he frankly says that he thinks it in a bad way. He attributes its decadence to the practice of advertising dramatic art and artists "upon the fences in red letters," and insists that before it can reach a high level it must be taken away from "managers' greed" and "from the fences." The sight of the posters on the fences makes him, he says, "sick at heart." This is a feeling shared by few dramatic artists, most of whom, far from being made sick at heart by seeing the fences covered with their posters, are exhilarated and cheered and nerved to fresh efforts by the sight. In the palmy days of the Greek drama the stage was not afflicted by the abuse of which Rossi complains, but this was because the Athenians had few fences and knew nothing about advertising or posters. The use of the fence as a means of communicating ideas is a feature of modern life, just like steam and electricity and manufactures, and it is therefore as idle for Rossi to protest against posters as for Ruskin to proclaim that railroads and mills make him sick at heart. Another criticism made by Rossi is directed against his own manager, for making him act six times a week. The result of this has been that he is kept perpetually moving "from the hotel to the theatre, then back to the hotel and off to the depot." Acting requires inspiration, "and inspiration does not come from either the hotel, theatre, or depot." This is forcibly put, and throws a good deal of light on the character of the performances of many of our most successful travelling companies.

The Civil-Service Reform Association of Baltimore wrote to the new Collector of the Port, Mr. Webster, making inquiries as to his views touching the mode of appointment to office, and urging on him the adoption of competitive examinations. They got a very characteristic answer, which might be used as a common form on all similar occasions by those who like the spoils system, and mean to stick to it, but do not care to avow it. He opened by apologizing for his delay in answering on the ground that his time had been completely absorbed in doing the very thing the civil-service reformers want him to stop doing—namely, listening to persons seeking appointments for themselves and their friends. All the time thus spent was taken

away from his legitimate duties both as a citizen and a Collector. He then makes the customary expression made by all politicians of a desire "to elevate the standard, intellectual and moral, of the civil service of the country," but avoids dexterously saying what he means to do for that end. He frankly confesses, as if in reply to the civil-service reformers, that qualifications for office cannot be determined "by competitive examinations alone." But nobody says they can. What civil-service reformers propose is to ascertain by competitive examinations whether a man is fit for probation in the public service; and they maintain, and nobody ventures to deny, that for this purpose it is far more effective than boss nominations. Mr. Webster says that when he left his present office in 1869, there were 160 employees in the Custom-house, of whom only three remain, and he says the others want to get back to the places which they had "faithfully and efficiently filled," but from which they had been removed, evidently without cause, to make way for the present holders. It is in order to be able to make these wanton changes that politicians fight against competitive examination. They would not remove a faithful and efficient employee if they were not able to designate beforehand the person who should take his place.

Notwithstanding the official denial on this side of the water of the suspension of the negotiations for a copyright treaty, a despatch from London again states that there is no likelihood of any convention being satisfactorily concluded. The failure of the pending negotiations would be a matter for universal regret, because it would establish the present system of international piracy on a secure footing for many years to come, if not for ever. Nor is there any real excuse for its failure. The delay and trouble that have thus far arisen have come solely from the publishers insisting on confusing the question of authors' rights with protection to publishers. As the negotiations have gone on they have consequently tended less and less in the direction of a treaty to establish an international guarantee for literary property, and more and more in the direction of a trade agreement between the publishers in the United States, England, and Canada to prevent the manufacturers of books in each country from being injured in their business by the recognition of international copyright. If the publishers would consent to a treaty giving authors full right to their property without conditions of any kind, there would probably be no difficulty in arranging a convention. Some of the publishers are, we believe, beginning to see this. The failure of the present negotiations will do no American publishers any good except those engaged in piracy pure and simple.

The South American diplomatic inquiry had hardly begun before it produced a very amusing incident in the solemn decision of the Foreign Relations Committee, in secret session, that Shipherd should produce all his correspondence with public men, except members of Congress. This action was hinted to the committee by Shipherd himself, who on being called upon to produce the Peruvian Company correspondence, suggested that there were portions of it which members of Congress might not like to come out; or, in other words, that the letters implicated some of them in matters which if made public would do them no credit. The committee at once decided that they did not want to see any such letters; that what they wanted to know was only what the "other public men" had been doing. The idea of an inquiry into a scandal supposed to involve Congressmen under rules excluding all evidence relating to them, struck Mr. Belmont as being wrong in principle, however convenient to those involved, and on Thursday he introduced a resolution in the House requiring Shipherd to produce all his correspondence, and the resolution was adopted. The most remarkable feature of the whole transaction is that Shipherd and all the members of the committee preserved perfect gravity from first to last. Not a man among them all so much as smiled.

The effect of a notice that a husband will not be responsible for his wife's debts is well understood all over the world; but there is more difficulty in estimating the legal consequences of an advertisement warning managers against engaging wives for theatrical performances. Mr. Woods, whose wife has left him for the stage, has published an advertisement in the *Clipper* to the effect that managers engaging Mrs. Woods "will be prosecuted." This is not the only remedy either to which Mr. Woods proposes to resort. His advertisement continues: "She is between thirty and thirty-five years old, medium height, light eyes, brown hair, just turning a little gray, very slim build, weighing about ninety-five pounds, and when she last wrote home was playing in Ohio. She is recently reported to be in Iowa with a barn-storming show. Members of troupes in which she may be found are liable to have their baggage attached." An attachment of the baggage of the whole troupe, accompanied by a criminal prosecution of the manager, would probably cause serious trouble even in a "barn-storming show." It does not appear that Mr. Woods has taken legal advice. He has probably acted upon the ancient maxim of the common law, that there is no wrong without a remedy.

The interview of the Sultan with General Lew Wallace, reported by telegraph, in which the Sultan sought much information about America, "especially in regard to the judicial system and the mode of collecting taxes," shows that, though he has taken upon himself a larger share of the government than any of his predecessors within sixty years, he is also a student of comparative politics. His attention has doubtless been called of late to the likeness between his own administrative system and ours, which many European writers now point out. In the last *Revue des Deux Mondes* the author of an article on the financial condition of Turkey declares that the only civil service in the world which resembles the Turkish is that of the United States. These allusions have doubtless made the Sultan prick up his ears, and suggested to him that there are perhaps new modes of robbing taxpayers and defrauding the public creditor in use here of which he has not heard, and which he might readily adopt. General Wallace might, however, have politely assured him that we had nothing in this line worth his examination, except our system of winding up insurance companies in this State, and the old moiety system of detecting Custom-house frauds. Both of these would, however, seem to him very imperfect instruments. But we have a judge or two in this State whom we advise him to import at any reasonable expense, and a very choice lot of "receivers," who, we think, could teach even some of the older pashas a few useful wrinkles.

It is becoming more and more clearly recognized that the success of the Irish Land Bill is being seriously impeded by the fact that it offers no deliverance from the arrears of rent accumulated before it came into operation, whether through prolonged rack-renting or the losses of the three recent bad years. Evictions on account of these arrears are taking place all over the country in greater or less numbers, thus keeping up the irritation which the Act was expected to remove, and furnishing an excuse for the continuance of the outrages. It seems, of course, a mockery to allow a tenant to be ejected for non-payment in bad years of a rent which the courts stand ready to say he ought not to pay even in good years. How to deal with the matter it is, however, not easy to say. It is supposed the Government will not venture to interfere *ex post facto* with the operation of contracts, and the landlords half hope that it may undertake to pay the arrears out of the treasury, which is, however, still less likely.

The proclamation of Pierola, who is at work attempting to organize a government in Peru, is a remarkably sensible and moderate document for such a bloodthirsty tyrant (as he has been represented) to put forward. He insists that something must be done at once, and also that if it is to have any permanent value it must be the result of a general popular movement, and not the act of any of the irresponsible "barrack or intrigue-produced chieftains" now before the public. For himself, he declares it to be "indispensable" that he should not be at its head. "This would tend to maintain the personal policy it is so necessary should be destroyed, and would cause many to consider your patriotic labors as employed on behalf of my ambition." Either this is true, or else affairs in Peru have reached the point at which corruption and anarchy have made self-government of any kind impossible; in which case Pierola will probably be ready to take a sterner tone and have something further to say about the necessity of a strong government for those who are unable to produce one of their own. The Chilians are said to look with favor on Pierola's attempt, which suggests the probability that he is no longer a Crédit-Industriel man, or a Dreyfus man, but a true Peruvian patriot again, who longs for peace and a quiet life, with a regularly-paid salary under the old flag.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

THE Republican members of the House of Representatives held a caucus on Wednesday last with a view to agreeing on some concerted plan of action. It was finally decided to attempt to secure consideration of the Tariff Commission Bill under the present rules, but, if this should be found impracticable, that then the Republicans should at once take up the proposed amendments to the rules, and endeavor to secure their adoption. On Monday a motion to suspend the rules and adopt a resolution providing that when next the House should go into Committee of the Whole the Tariff Commission Bill should be considered, and that it should then be a continuing special order, was carried by a vote of 152 to 56. The probability is that the bill will be passed by a majority of fifty or sixty.

Several good speeches have been made in the House during the week on the Chinese Bill, notably one by Mr. Taylor, General Garfield's successor from the Nineteenth Ohio district, which is reported to have been "one of the ablest and most scholarly and philosophical speeches ever delivered in the House on the Chinese question."

On Wednesday, in the House, Mr. Money, of Mississippi, persisted in making a speech when he was out of order, whereupon Speaker Keifer, after vainly attempting to silence Mr. Money, said that hereafter when members tried to impose on the chair and the House, in defiance of the rules and of efforts to preserve order, the chair would at least take pains to reprimand them. This use of the word "reprimand" was resented by Mr. Money and his Democratic colleagues, who desired to know by what right the Speaker could "reprimand" any member without an order of the House. The Speaker insisted that he had the right, and a scene of much confusion ensued. Peace was restored on Thursday, however, by Speaker Keifer's explanation that he did not use the word "reprimand" in a "technical sense."

The Post-office and Fortifications Appropriation Bills have been passed by the Senate.

The Senate in executive session on Thursday afternoon unanimously ratified a declaration that the United States accede to the Geneva Convention of August 22, 1864, and October 20, 1868, "for the amelioration of the wounded of armies in the field," commonly known as the "Red Cross treaties."

On Thursday, in the Senate, the franking privilege for Congressmen was revived on a motion of Senator Edmunds, and carried as an amendment to the Post-office Appropriation Bill.

The Committee on Appropriations has submitted a voluminous report to the Senate, stating the result of the investigation of the Contingent Fund expenditures of the Treasury Department. The report cites testimony showing that the Treasury funds were used by persons who had Secretary Sherman's Presidential campaign in charge, and that Treasury employees worked on Mr. Sherman's premises on Government time. Mr. Sherman in his testimony denies positively having any knowledge of these matters, and was "mortified beyond expression" when he found it out.

The House Committee on Foreign Affairs has been engaged in investigating the various scandals connected with our diplomatic relations with Peru and Chili. Jacob R. Shipherd appeared before the Committee on March 15. He desired to know whether the order he had received to bring copies of all letters written to or received by him from "officials of the United States" was to be construed as meaning to include his correspondence with members of Congress as well as with officers of the State Department. An executive session of the committee was thereupon held, in which it was decided that only Mr. Shipherd's correspondence with "any United States Minister or officer of the State Department" should be produced. Mr. Shipherd promised to have copies of the correspondence ready by Saturday, and the committee adjourned until that day.

On Thursday Mr. Belmont offered a resolution, which was adopted by the House, calling upon Shipherd for copies of "*all* correspondence between himself and any person or persons whatsoever, and all other evidence in his possession tending to show what said Shipherd did, or attempted to do, to enforce the claims of the Peruvian Company, or to induce the United States to enfore those claims against Peru."

When the committee met again on Saturday the chairman read a letter from Mr. Shipherd, in which he said that he had been "prostrated by a very acute attack of malarial fever," and could not travel, but hoped to be able to appear before the committee on Tuesday morning.

Shipherd finally appeared before the committee on Tuesday, and gave some interesting testimony. He said that he addressed a letter to Mr. Hurlbut, suggesting that he and his friends might have $250,000 worth of stock in the Peruvian Company, and when asked by a member of the committee whether he "regarded Mr. Hurlbut as purchasable," he replied, "Most emphatically, and I dealt with him as I would with a recognized criminal, believing that if I did nothing to protect the company, he would antagonize it." Mr. Shipherd also testified that Senator Blair was engaged as his personal counsel not on account of his legal abilities, nor because he was a United States Senator, but simply because he was an intimate friend of Secretary Blaine's. Shipherd said he had had frequent interviews with Mr. Blaine, in which he had unfolded the whole scheme of the Peruvian Company, and that Mr. Blaine had listened with very great interest. Mr. Blaine finally asked him what he wanted done. Mr. Shipherd replied that he would ask but little of the United States Government at present. All he wanted was that the Government should give notice to both Peru and Chili that this claim was pending, and that therefore no Peruvian Government could innocently sell guano to outside parties. "That shall be my first business," replied Mr. Blaine.

On Friday Mr. Frelinghuysen transmitted to the House Committee on Foreign Affairs an explanation received from Mr. Morton in regard to his connection with the Crédit-Industriel contract. Mr. Morton says that he "has never at any time been associated with any business transaction needing or expecting the intervention of the United States"; that the contract was entered into by the banking house of Morton, Bliss & Co., in the ordinary course of their business, during Mr. Morton's absence, "and before his departure for his present post." Mr. Morton goes on to say that he has never used nor thought of using his official influence in any way whatsoever to further the objects of the contract with the Crédit Industriel.

On Saturday the Civil-Service Committee of the House appointed Representatives Curtin and Neal to confer with Colonel Dudley, Commissioner of Pensions, with reference to adopting the principles of civil-service reform in the additional appointments about to be made in the Pension Office. It was the unanimous opinion of the Committee that the "Additional Clerk Bill" should have engrafted upon it the principles of the reform in order to give it a full and impartial trial, and thus establish a base for further and more general legislation hereafter.

The majority and minority reports of the committee appointed to audit the expenses of the illness and funeral of President Garfield, have been prepared and will soon be presented to the House. The minority report will be presented by Mr. Blackburn, and will oppose the allowance made to the physicians and others by the majority. It is expected that there will be an opportunity to pass upon the items in the bill, some of which will be severely criticised.

Mr. Scoville has signified his intention of withdrawing from the Guiteau case, and Guiteau has written to Mr. W. A. Cook asking him to appear for him at the General Term. Mr. Cook has not yet replied.

Since the publication of Sergeant Mason's sentence, subscriptions have been started in various parts of the country with a view to raising a fund for the benefit of his family. In addition to this, many petitions to the President are being circulated to obtain a mitigation of his sentence to simple dismissal from the army, and the Legislatures of several States have passed resolutions to the same effect.

The author of the attack on President Garfield, which appeared some days ago in the Washington *Post*, has written another letter in reply to his critics, and signed it with his true name, which is William Brown. He was a delegate from Kentucky to the Chicago Convention, in which he supported Blaine, but he is said to be a "Stalwart," and to have "greatly preferred Grant."

Colonel William A. Cook has withdrawn from the prosecution of the Star-route suits. On Sunday his letter of resignation was made public. He says that he was strongly inclined to retire from the cases after the death of President Garfield, but that he was induced to remain because he had good reason to believe that it was supposed that his retirement might interfere with the finding of indictments in certain of the cases. Mr. Cook goes on to say that he found, however, that his relation to the cases had become essentially changed; that the indictments which have been found have been "chiefly in the cases selected by Mr. Bliss"; but that "whether the strongest and most important cases have been included in the indictments is not for me to determine."

Attorney-General Brewster replied in rather a sharp letter, in which he expressed surprise at Mr. Cook's action, and said that he could see no necessity for it. Mr. Cook and Mr. Bliss have both been "interviewed" on the matter, and from Mr. Cook's statements it would appear that he thinks he has been intentionally slighted by the other gentlemen engaged in the prosecution with a view to forcing him to withdraw.

At a meeting of the Cabinet on Tuesday the case of Cadet Whittaker was taken up, and the sentence of dismissal from the service imposed by the court-martial was disapproved on the ground that the technical evidence taken at the trial was improperly introduced. This action sustains the opinion of the Judge-Advocate-General. Whittaker will therefore be released from arrest, but he will be dismissed from the Military Academy, as provided by the Revised Statutes, on account of his having been found deficient in his studies.

President Arthur will give his first public reception on the evening of March 28.

The President has approved the joint resolution appropriating $150,000 for the benefit of the sufferers from the Mississippi floods.

The President has signed the commissions of John Russell Young to be Minister to China and Cornelius Logan to be Minister to Chili.

Judge Blatchford has accepted the Associate Justiceship of the Supreme Court, and on Monday the Senate Judiciary Committee unanimously agreed to report the nomination back to the Senate, with a recommendation that it be confirmed.

Despatches from the Mississippi Valley report the suffering in the overflowed districts to be still very great, although supplies are being distributed and assistance of all kinds rendered as fast as possible. The river has been falling slightly during the week. The Yazoo district is at present the scene of the greatest suffering. The water from the Mississippi and the back water from the Yazoo river meet and form dangerous whirlpools,

which destroy everything in their course. One of these whirlpools struck a church a few days ago, and tore it to pieces in a few minutes. Apart from the mere suffering from want of food and exposure, the loss of life from drowning has been very considerable.

The Democratic Senatorial Campaign Committee have elected Senator Davis chairman of the Committee.

The Iroquois Club of Chicago gave a dinner on Wednesday to celebrate the anniversary of Andrew Jackson's birthday. A number of prominent Democrats were present, who delivered speeches, and letters and telegrams were read from others who were unable to attend.

The leading Independents of Georgia held a caucus in Atlanta, on Monday, and formulated an address to the people, urging the formation of a new party, and calling for a mass meeting of all Georgia Independents, to meet in Atlanta on June 1.

The trial of fifty-eight oyster pirates, captured by Governor Cameron's recent military expedition off the mouth of the Rappahannock River, was concluded in the County Court of Matthews county, Va., on Friday. The men were sentenced to one year's imprisonment in the penitentiary, and the fleet of seven depredatory vessels was confiscated to the State.

A great strike is in progress in Lawrence, Mass. Over three thousand operatives of the Pacific mills in that city have struck on account of a reduction in their wages.

Secretary Hunt has received a report, dated Yakutsk, Siberia, January 6, 1882, from Engineer Melville, of the *Jeannette*, in which he recounts the events subsequent to the dispersion of the three boats of the *Jeannette* on the night of September 12, 1881. He is now engaged in searching for Lieutenant De Long and his party, whom he believes, from his knowledge of the country and the evidence of two of the first cutter's crew who had been sent ahead on the 9th of October by De Long to seek relief, and were found on the 2d of November by him, to be somewhere to the westward of the Lena, in a large tract of barren and desolate country devoid of subsistence. To search this region, Mr. Melville says, will require a large force, with proper authority from the Russian Government. In the course of his search for De Long, which he commenced on the 5th of November, Engineer Melville found three records, which had been left in huts at various points of his route by De Long. The first two are dated at a hut on the Lena Delta, September 19, 22, and 24, and the last one was found in another hut by a Yakutsk hunter, and is dated October 1. In this last record De Long says his party consists of fourteen, and that, as they have been fortunate enough to get game in their pressing needs, they have no fear for the immediate future, and that they are all well except one man, whose toes have been amputated in consequence of frost bites.

FOREIGN.

The debate on the proposed new rules of Parliamentary procedure was resumed in the House of Commons on Monday evening. Mr. Gladstone stated that he would move the first seven and the last two rules to be standing orders. The Marquis of Hartington, Secretary of State for India, said that the *clôture* proposed was nothing more than a modification of the existing restrictions on debates, and that the probable effect of the resolution had been greatly exaggerated. The Government was unable, under the present system, to carry on the business of the country with dignity and effect. If other persons thought they could do so, the Ministry would with pleasure resign, but so long as the Ministry remained responsible, they must appeal to the House to give them those powers which alone are sufficient for the conduct of business.

A meeting of the Conservative members of Parliament was held at the Carlton Club on Friday to consider the *clôture* resolution. The meeting was private, but it is understood that Sir Stafford Northcote expressed a desire to oppose *clôture* to the utmost; his willingness to vote for Mr. Marriott's amendment to the proposed Parliamentary rules, which provides that no rules shall be considered satisfactory which will enable a bare majority to close a debate; and a desire to conclude the discussion before Easter. Those present heartily coincided with his views. The Conservative leaders incidentally laid great stress on the necessity of dealing with the utmost caution with matters relating to Ireland.

Mr. Charles Russell's memorial in favor of revising the clauses in the Land Act having reference to arrears of rent has been signed by more than 100 members of Parliament, and fifty Liberal members have signed a memorial in favor of more leniency toward the imprisoned "suspects."

The electors of Northampton have held a meeting, at which they passed resolutions approving Mr. Bradlaugh's conduct in the House of Commons, and authorizing the Executive of the Liberal and Radical Union to sign a petition to the House, praying that he may be heard at the bar in support of their claim of the right to be represented in the House by speech and vote of duly elected members.

In the House of Commons on Friday evening a motion offered by Mr. Gorst, praying that the Queen revoke or alter so much of the charter of the British North-Borneo Association as gives implied sanction to slavery, was rejected by a vote of 125 to 62. Mr. Gladstone stated that he had assumed the responsibility of granting the charter, and that if the company failed to abolish slavery, the Government would revoke it.

The Berlin correspondent of the *St. James's Gazette* wrote on Wednesday that the Russian representatives at the German Courts have been instructed to tender to the respective Governments to which they are accredited demonstrative assurances that the Czar is firmly resolved to maintain amicable relations with Germany. Notwithstanding such statements as the above, however, various threatening rumors have been circulated in regard to the relations between Germany and Austria and Russia. On Thursday it was telegraphed from Berlin that Austria had finally determined to annex Bosnia and Herzegovina, and that during his recent visit Count von Wolkenstein made overtures to Prince Bismarck concerning the question, and that the latter favors such annexation, and has been using considerable pressure to induce the Porte to acquiesce. This statement was subsequently contradicted, but it is nevertheless probable that there was good foundation for it. It is said that there is a general understanding between Germany and Austria jointly to resist a Russian attack on either power, and that an arrangement of details for immediate action, should it be necessary, has been made.

It is impossible to discover with certainty what the Czar said to Skobeleff in his "reprimand," or what Skobeleff said in reply. There are numerous versions of the matter, and the latest is that "General Skobeleff, replying to the Czar's serious reprimand in relation to his speech in Paris, pleaded in excuse that he did not know himself what he said."

A London despatch from Copenhagen says that the Czar has received convincing proofs that the Nihilists are determined to abandon their policy of assassination, and that Imperial clemency will consequently be extended to political prisoners.

The committee of twenty-two of the French Chamber of Deputies, appointed to examine M. Boysset's proposal for abolishing the Concordat, is reported to be, with the exception of two of its members, opposed to the measure. M. Paul Bert has been elected president of the committee.

The French Government has introduced a bill in the Chamber of Deputies allowing witnesses in law courts, instead of taking the oath before God, to promise on their honor and conscience to speak the truth.

M. Léon Say, French Minister of Finance, has submitted to the Chambers a demand for a grant of 8,000,000 francs to defray the expenses of the expedition to Tunis for the first quarter of 1882.

A despatch from Tunis announces that a plan for a forty days' campaign in southern Tunis has been agreed upon, and the various movements will commence in the course of a week. Three columns of troops will advance from three different points. It is desired to inflict a signal defeat on the Arabs close to the Turkish camps on the Tunisian frontier, as it is thought that nothing else will disabuse their minds of the hope of Turkish aid

A despatch to the London *Times* says that in consequence of a pressing inquiry by England, the Bey of Tunis has admitted the cession of all the principal Esparto grass districts to French capitalists. The value of the exports from these districts is estimated at 6,250,000 francs a year. It is said that M. Roustan used "great pressure" with the Bey to induce him to make the cession.

In the Greek Chamber of Deputies on Thursday M. Tricoupis, the new Prime Minister, in reading the programme of the new Government, said the country must be prepared for the coming changes in the East, and that amicable relations must be maintained with every country, especially with Turkey.

General Wallace, United States Minister at Constantinople, had an audience with the Sultan on Friday and dined with him on Saturday.

The press in Berlin severely criticises the appointment of Mr. Sargent as Minister to Germany, and comments on the "impropriety" of appointing such a successor to men like Bancroft, Taylor, and White.

Señor Sagasta, President of the Spanish Council, at a meeting of his supporters on Sunday, dwelt on the necessity of discipline in order to effect, before the close of the financial year, a complete change in the commercial and colonial policy of Spain; to infuse a spirit of toleration into civil and penal legislation; to improve Spain's relations with her colonies and the foreign nations who are desirous of an extension of commercial intercourse.

A meeting of Spanish Conservatives was held on Saturday to decide upon their conduct during the forthcoming session of the Cortes. Señor Canovas del Castillo, who presided, said the party would continue to attack the policy of the Government, but was not blindly opposed to reforms. The chief point of attack upon the Government would be in regard to the new tax laws.

At a meeting of Democrats in Madrid on Sunday, Señor Martos presiding, it was decided to make special efforts to induce the Government to carry out the Liberal reforms.

Advices from Buenos Ayres to February 24th state that Mr. Walker Blaine was about to resign his mission and would return to the United States with Mr. Trescot. A protocol has been signed at Santiago in which Chili declares that she meant no offence to the United States by the arrest of Señor Calderon, while on the other hand Mr. Trescot repudiates Mr. Hurlbut's action as offensive to Chili. The Chilian Government declares that it will not treat with Señor Calderon, and will make peace only on the following conditions: the cession of Tarapaca in perpetuity; the occupation of Peru as far as Moquegua until an indemnity of $20,000,000 is paid, and the possession of half the guano islands of Peru. Mr. Trescot agreed to these conditions and forwarded a copy of them to Washington.

Advices from Rio de Janeiro state that rain has fallen in torrents during the last six weeks, doing great damage to the railways, and destroying several towns.

TUESDAY, March 21, 1882.

THE MASON CRAZE.

THE movement in favor of the pardon of Mason, the soldier who fired at Guiteau, whether it finds expression in a petition with 20,000 signatures or with 500,000, as is threatened, is a symptom of relaxation of the moral fibre which is anything but pleasant. If it indicated widespread disease—which we do not think it does—it would make the epithet law-abiding inapplicable to the American people. It was quite natural that people should wish to see Guiteau killed. This is what every one wishes who desires to see the sentence lately pronounced on him carried into effect. That sentence was death, and all those who approve of capital punishment and do not believe him insane think he deserves death. But then one of the most marked differences between a civilized and a barbarous community is, that, in the former, private citizens abstain from killing those whom they think ought to be killed. They do this for two reasons. One is a moral one. They know that appearances are deceptive, and that many a man may appear to deserve killing who would, on proper inquiry, turn out to deserve nothing of the kind, and they know that private individuals have not the means of making proper inquiry. The other reason is social. They know that if private persons were allowed to kill off all those whom they considered unfit to live, there would be so many executions that the population would be considerably diminished, and a state of terror would be produced in no way differing from anarchy. Sentence of death would frequently be passed, perhaps even in a majority of cases, by personal enemies, by expectant heirs, by rivals in business, and by insolvent debtors.

The very first step in the organization of a political community, therefore, is the relegation of the duty of killing people to the officers of the law. No community in which this has not been done is civilized, or moral, or religious, or anything else that is respectable. In some parts of the West it has only been imperfectly done. The law does some of the needful killing, but parties of lynchers do the rest, the law being too feeble to do the whole work. But then the communities in which these things occur are more or less barbarous. They may have pianos, billiard tables, good restaurants, Aubusson carpets, and water on every floor, but they want the one thing needful—government strong enough to do all their killing for them. All other parts of the country are shocked and scandalized by their condition. No one would like to have the United States confess that they were not competent to catch their own criminals, or competent to punish their criminals after they had caught them, and had to call in lynchers to help their own officers to give murderers and robbers their due.

The one pleasant and gratifying thing about the Guiteau case was the patience with which the people submitted to what was really a very revolting trial, because it was a legal proceeding. It was the one thing with which hostile foreign critics found it difficult to deal, because the reproach which has always been hitherto levelled against the American people, touching their mode of repressing crime, has been that they were apt either to let it go unpunished or to punish it by irregular methods. The perfect calm with which the public watched the officers of the law pursuing an inquiry of extraordinary tediousness into the commission of a crime which had created unprecedented excitement, did more than neutralize the scandal produced by the mode in which the trial was conducted. It showed that the public could wait, or, in other words, was as law-abiding and time-abiding a public as any in the world.

The credit reflected by this attitude was not diminished in the least by Mason's attempt on Guiteau's life. It was the act of one man, who might have been drunk, or crazy, or in some manner off his balance. Where it begins to touch the national reputation is at the point where the public begins to express itself about the manner in which the military authorities are dealing with Mason. His trying to kill a prisoner whom he had in charge, could not possibly be more praiseworthy than a spectator's trying to do so in the court-room. It is only by looking at a soldier's duty from the *bouffe* point of view that his attempt can be considered no more blameworthy. If there be any value in faithfulness to trusts, in the sanctity of an oath, in the obligation of service voluntarily undertaken, Mason did a far worse thing than a man in the streets who tried to lynch Guiteau would have done. He did nearly the basest thing a soldier can do. He disregarded all the moralities which distinguish a soldier from an armed ruffian. He put himself in the position of a profligate clergyman, or an embezzling cashier, or a drunken temperance lecturer. In taking him up, therefore, as an object of sympathy, and trying to depreciate the authority of those who have punished him, and exalt the quality of his act, his admirers do far more than express their detestation of Guiteau. They help to belittle the very virtues which do most to keep society together, and palliate the loose way of looking at social obligations of which Guiteau's career was a very striking illustration. In fact, the moral atmosphere which Mason's friends would fain create, and diffuse through the country, is the one which produces Guiteaus by breeding in them the faithlessness and wilfulness which instigated his offence. Once propagate the Mason way of looking at duty, and we shall have an Army of cranks, who will not always shoot at the man who deserves death, or prove false to obligations which are of but little importance to the community.

THE FIRST YEAR OF ALEXANDER III.

ON March 13 (March 1, O. S.) Czar Alexander III. repaired to his capital, to pay a solemn tribute to the memory of his father, on the first anniversary of the latter's assassination. In the evening he returned, unharmed, to Gatchina. Mournful as the occasion was, he must have felt thankful that he had safely passed the first Ides of March of his own reign. When he ascended the throne, at the foot of which lay the mangled body of his father, the chances of reigning a whole year must have appeared to him poor indeed. A year has passed, and Alexander III. still lives, his throne stands, and autocracy is still the law of the Empire. This is, however, all that the new Czar can congratulate himself upon when looking back on the twelvemonth which h has survived. No catastrophe has taken place —no catastrophe has *yet* taken place: this is all. The Empire, himself, and autocracy are one year older. Is the future of either more secure to-day than it was a year ago? Has Nihilism been stamped out, discontent allayed, harmony between the throne and the nation created? Is the third Alexander more beloved than the second? Does he trust in the people, or the people in him? Does either trust in his counsellors? Has any initiative been taken for a new course? Has a new line of policy been marked out, or foreshadowed? Has the attachment of the people, of a single class of the nation, been won by firmness, wisdom, liberalism, or moderation? Unfortunately, all these questions must be emphatically answered in the negative. Everything is as it was on March 13, 1881: the same bloody past, a present full of terror and evil forebodings, a future hid in darkness. Worse than that, a new reign has been tried and has been found wanting; there is one hope less.

When Alexander III. succeeded his father a scaffold had to be erected beside the new throne. Even if wisdom counselled generous forgiveness, decency prevented it. The father, the Emancipator, had to be avenged. The spectacle was intended to be horrid and horrifying: it became tragically grand. Zhelyaboff and his associates, standing under the gallows, appeared to the people of St. Petersburg, not like wretches whom society chastises and casts out with loathing, but like self-sacrificing avengers of oppressed generations; like heroic, though perhaps misguided, precursors in a struggle for freedom—a struggle which the blind obstinacy of Czardom rendered both unavoidable and awful. The shadow of a new gallows falls upon the close of the year, and there is no change of sentiment. A score of conspirators have just received their sentences—half of them to die by the hand of the executioner—and, though the public, this time, was not admitted to the trial, the general feeling is that Trigonya, Sukhanoff, Anna Yakimova, etc., are not vile malefactors either, but men and women who cheerfully give their lives for the cause of freedom, and that their blood will be the seed of fresh martyrdoms. It is true that the crimes now to be expiated are not of very recent date, and the hecatomb is still intended for the manes of Alexander II.; but new attempts and new murders have also taken place, new plots are daily pointed out by the vigilant guardians of the court, and the court is still hiding at Gatchina. Surrounded by bayonets, Alexander III. occasionally dares to show himself for a few hours to the people of St. Petersburg, and he has also paid a flying visit to the old capital of his Empire, Moscow. So much he must do in order to avoid the dangerous reproach of cowardice; to do more

would be recklessness. The coronation is indefinitely delayed from fear of bullets and dynamite.

Reforms of a liberal character were hoped for at the beginning of the new reign. The late Czar was believed to have taken, shortly before his death, the first steps toward instituting a parliamentary régime. His trusted adviser, Loris-Melikoff, on whom he had bestowed almost dictatorial power, was universally credited with the inclination to initiate the change, and the necessary energy to carry it through. The Grand Duke Constantine Nikolayevitch favored this transformation. The influence of the new Emperor's Danish consort was also counted in its favor. The Ministers of War and Finance, Dmitri Milyutin and Abaza, that old Liberal, Valuyeff, and Shuvaloff, who knew both Russia and Western Europe well from long experience, would have become staunch supporters of constitutionalism. But Alexander III. had imbibed different notions in his youth; he was an admirer, and to a degree a disciple, of Ivan Aksakoff, the most impassioned apostle of Slavophilism, and of his friend Katkoff, whose Moscow *Gazette* had dethroned Hertzen, and daily preached contempt for parliamentarism in the West-European shape. He shuddered at the idea of a Russian assembly of notables or states-general, which would take the reins of government out of his hand, and most probably lead his people, by rapid steps, from revolution to anarchy and terrorism, and himself and his house, like Louis XVI. and his house, to the block. He clung to autocracy, supported by bayonets and the loyalty of the peasantry, as the only anchor of salvation. The advice of the Moscow party prevailed, and Ignatieff, who had betrayed Alexander II. into the war of 1877 and was removed from his councils after Plevna and again after the Congress of Berlin, became the Ahitophel of the young monarch. Scarcely two months had elapsed under the new sceptre when Abaza, Milyutin, and Loris-Melikoff resigned, and an imperial manifesto proclaimed to the nation and the world that the new Czar was determined to preserve absolute autocracy intact and unimpaired. The nation was to remain without a share in the government; only the peasant, emancipated by Alexander II., was to be benefited by further alleviations of his burdens, and the Orthodox Church and the nobility were to be the main pillars of the throne. Such men as the arch-conservative nationalist Vorontzoff-Dashkoff and the orthodox zealot Pobyedonostzeff were called into the Cabinet. Ignatieff succeeded Loris-Melikoff as the all-powerful Minister of the Interior. Reforms on a small scale were promised, and numerous commissions for special purposes were appointed—to report at some future day, which few have as yet done, and only one with effect. The provincial assemblies, long curtailed of their privileges, were condemned to silence; political offences were entirely withdrawn from the jurisdiction of the regular tribunals; the press was muzzled more rigorously than ever; and the hunt of revolutionists was unremittingly and mercilessly continued. This condition of affairs, too, has outlived the first year of the new reign.

In the last days of Loris-Melikoff's administration—when his position was already completely undermined and his power but nominal—an atrocious popular persecution of the Jews broke out in Ukraine, a province in which recollections of massacres of Poles and Jews, such as Chmielnicki and his revolted Cossacks, committed in 1648, and Gonta and his Cossacks in 1766, are still alive in the memory of a fanatically superstitious people, prone to race hatred and sudden outbursts of ferocity. The outbreak, which rapidly spread over the adjoining parts of southern Russia, was probably spontaneous, many minds being wildly agitated by anarchical passions after the assassination of Alexander III.; but it was soon fomented by low agitators of the Panslavic school, always anxious to fan the flame of national animosity against the non-Russian, as well as by the more unscrupulous of the nihilistic foes of the Government, equally anxious to stir up the people and bring about, by whatever means, a collision with the soldiery. The provincial authorities, waiting for orders from the capital, and not knowing in which direction the wind was going to blow there, looked on with folded arms. On Ignatieff devolved the task of putting a stop to widespread desolation, and preventing the recurrence of the atrocities. The disorders were slowly suppressed, perpetrators of heinous crimes were punished with a paternal leniency in strange contrast with the Government's sanguinary proceedings against political disturbances, and a commission was appointed to investigate—what? the guilt of the Jews in provoking the disorders. New restrictions upon them were to be decreed. It was evident that Ignatieff and his friends saw in the outbreak a useful diversion of the agitated public mind, and in the religious and national fanaticism which had a share in prompting it, a lever for moving the orthodox Russian masses against "the heathen" in the "Vistula Land," and the Ruthenian masses in adjacent Galicia, whenever the hour for action abroad should strike.

For action abroad is, there can be hardly a doubt, the main reliance for the future of Ignatieff and his Slavophil supporters. A vigorous and warlike Panslavic propaganda—revolutionary and fierce, if so it must be—is alone capable of giving a new direction to the aspirations and wild yearnings of the Russian people, of turning away from their internal subversive schemes the bulk of the reckless young generation, of creating a new interest in the crowned head of the nation, thus transformed into a leading champion in a revolutionary crusade against Teutons, Magyars, and Turks. Had such a policy been pursued at all hazards in 1878, they argue, Vera Zasulitch would not have achieved her triumph as a Russian Charlotte Corday, nor Solovieff fired his pistol at Alexander II.; the explosion under the Moscow Railway, the Winter Palace explosion, and the catastrophe of March 13 would not have taken place; the Tchernayeffs and Skobeleffs, instead of the Zhelyaboffs, would be the models of patriotic youth; the Sophia Perovskis, instead of working in mines to be charged with regicidal dynamite, would nurse Russian heroes in field hospitals. The struggle would be long and all-absorbing, and even if it were not to end in the regeneration of effete Europe through Russian blood—a regeneration for which Ignatieff himself has no particular desire—it would surely lead to a reconciliation between the Czar and his faithful people, would bury in oblivion the nihilistic theories of Bakunin and Tchernyshevski, and long keep the Moscow party and its chosen instrument in power.

So far, so good. But as long as the alliance of Germany and Austria-Hungary—called into life by Bismarck—lasts in all its strength, and France, distracted by parliamentary strifes and self-invited African troubles, is unable or unwilling to risk a new grapple with Germany in alliance with Russia, nothing is left to Russian statesmanship but temporizing, the cautious trying of makeshifts, and a tentative advancing, alternating with prudent retreats. Germany must not be definitively provoked, for she might now in a short campaign disastrously defeat Russia, force her to an ignominious peace, and thus ruin the prestige of her dynasty forever. Austria-Hungary must not be assailed, because Germany is determined on preserving her as her ally. Only secret intrigues against her in the Balkan peninsula, like those which led to the Herzegovinian revolt in 1875, to Servia's war, under Tchernayeff's command, in 1876, and finally to Russian intervention in 1877, can be attempted. Czar Alexander III. must go to Dantzic to renew the old friendship of the Romanoffs with the Hohenzollerns. He must keep the peace-loving Giers in the Foreign Office while old Gortschakoff is rusticating. He must frown upon the aggressive utterances of Skobeleff at the celebration of the anniversary of the capture of Gök Tepe.

ADMINISTRATION OF THE CITY OF BERLIN.—I.

If to love light rather than darkness is an indication of good conduct, the government of the city of Berlin must be most excellent. Those to whom it is intrusted appear to take satisfaction in exposing their every act to the widest public. Account is rendered to the whole world of expenses and receipts to the last pfennig, of the motives which have guided the authorities in their past actions, of their future plans, and of their methods; the names, addresses, and functions of all concerned in the administration of the city are published; the citizens are instructed in the city constitution, the relations of city to state, and the changes which the city fathers think desirable.

In the 'Personal-Nachweisung der Berliner Gemeinde-Verwaltung,' information is given in the fewest words concerning the location, purposes, and officers of every city institution, as well as the names and duties of all those who in any way take part in governing the city. It is to the city what a register or catalogue is to a university or college. Like the other publications of the city, it may be purchased of any book-dealer for a moderate price. The Director of the Statistical Bureau of the city publishes every year 'Das Statistische Jahrbuch der Stadt Berlin.' This contains the city's annals expressed in figures. It is to the city much the same as a well-kept diary would be to an individual, if the events it described were arranged and classified at the close of the year. It is a work of scientific value,

which shows in a surprising manner how much useful, curious, and at the same time highly interesting information can be conveyed in tables of figures. But the most valuable of all the city's publications are the reports of the magistracy. Four of these reports have been published. The first, appearing in the year 1842, described the administration from 1829 to 1840; the second, appearing in 1853, embraced the years 1841 to 1850; the third, published in 1863, treated of the decade from 1851 to 1860. The fourth report is the one of which we shall treat in this article.

The preface to the Report on the Administration of the City of Berlin, from 1861 to 1876 inclusive, describes the motives which have led the magistracy to publish it. It is hoped that it will be useful to the authorities of other cities, inasmuch as it furnishes the means of comparing different methods of striving for the same goal. It aims, further, to instruct citizens and officers who have only lately begun to take a part in the government of the city, in the work which has been already accomplished by the several branches of the administration, and to point out clearly the yet unsolved problems which arise from the concentration of a great number of men within comparatively narrow limits. The concluding paragraph of the preface to the third volume shows how clearly the city fathers have conceived the central idea of good government, and how earnestly they are endeavoring to fulfil their duty toward the city. They state that they have written a report which will find, they trust, numerous readers among the citizens—those who are simply voters as well as office-holders—and will lead to a better understanding of municipal affairs in wide circles, since the success of the future administration of the city depends to a great extent upon the earnestness and intelligence with which the Berlinese interest themselves in city institutions, and the fidelity with which they discharge their functions as citizens. Such openness and honest sincerity on the part of city authorities impress one who, like the writer, is a New Yorker, with a strange feeling of unreality. In fact, in reading many parts of this admirable report, one finds it difficult not to believe that it is a description of some city government in Utopia. Can the New Yorker realize the fact that there is a city where the streets are kept clean at a moderate cost, and the work done between midnight and morning so as not to interfere with traffic; where snow and ice are removed from the highways thoroughly and with despatch;* where the streets are well paved or are being paved, and in such solid, substantial manner that it seems as if the pavement must last for generations; where the city is well lighted without any gas-company quarrels; where the city gas works are so well managed that they yield a surplus equal to nearly a tenth of the net revenue of the city from all sources; where there are no rings; where there are no defalcations or thefts on the part of city officials; where there are no fat contracts: where there are no street-paving jobs and no neglected parks? Although a New Yorker might smile incredulously at the statement, there are such cities, and Berlin is one of them. A study of the administration of Berlin may assist us in discovering means to abolish the misrule to which we are subjected.

It can scarcely be more difficult to govern New York than Berlin. Both cities are of nearly the same size and both have grown rapidly. In 1829 Berlin had a population of 242,000; in 1876, one of 979,860†—an increase of over three hundred per centum. The entire expenses of administering the city were 2,317,656 marks* in 1829; in 1876, 34,740,245 marks—an increase of over thirteen hundred per centum. It is naturally a far more difficult task to keep Berlin clean and healthful than it is New York. Berlin is situated on a low, sandy plain. The Spree, with its numerous natural or artificial branches, surrounds the greater part of the city, but its banks are flat and the stream is sluggish. It carries off little dirt, and is more likely to do harm by becoming stagnant in summer than to aid in keeping the city pure. On the other hand, no city could, from a sanitary point of view, be more favorably situated than New York—on a long, narrow island, with shores sloping toward swift-flowing water, while the fresh air from the Bay drives away foul gases arising from decaying vegetable and animal matter. Berlin has had its peculiar trials to counterbalance the evils with which New York has to contend in its ignorant foreign population. Early in this century, it was suffering under French occupation, which was succeeded by the burdens of the War of Liberation. When Berlin obtained anew a considerable degree of self-government in 1808, the public spirit of the citizens had been nearly crushed by the long rule of Prussian absolutism. This is said in order to make it clear that a comparison between the government of Berlin and that of New York is not unfair.

German cities and towns occupy theoretically and, to a limited extent, practically somewhat the same position with regard to the state Government that our States do with reference to the Federal Government at Washington. The German "Gemeinde," *i.e.*, the commune or local political body, is often older than the state of which it is a constituent part. Once possessing sovereign rights, it now retains all that it has not given up voluntarily or otherwise. But the time when there were numerous independent and sovereign villages and cities in Germany lies away back in the Middle Ages. The ill use which many communes made of their liberty, the evils unavoidably resulting from innumerable independent political bodies of small size, and the necessities of modern life led to the triumph of a central state Government. The reaction against absolute local independence was carried too far. In the seventeenth and eighteenth centuries the absolutism of the German princes was able to deprive the communes of almost all power of self government. The mistake which had been made in crushing public spirit in that place where it was most likely to manifest itself, was recognized by Freiherr vom Stein, when the Prussian state lay in ruins as a result of the Napoleonic wars. It then became evident that the subjects had lost interest in a government in which they took no part. One of Stein's most important steps in the work of regenerating Prussia was the *Städteordnung* of 1808. The Städteordnung may be called the constitution of the cities. It contains the fundamental laws which guide them in framing their statutes, ordinances, and regulations. Although the Städteordnung of 1808 has been superseded by others, it has become the basis of Prussian municipal law. There are several Städteordnungen now in Prussia. In the six eastern provinces, including Berlin and the greater part of the state, the existing Städteordnung is that of May 30, 1853. Its main features are in harmony with Stein's Städteordnung and those which prevail in other parts of the monarchy. In describing the administration of Berlin, we are giving account of the general principles of municipal government in Prussia, and in fact in Germany.

The government of Berlin might be called republican with an aristocratic tendency. How republican it is may be seen by comparing it with the government of those three German cities which are at the same time republican states—viz., Lübeck, Bremen, and Hamburg, which are governed much in the same manner. Although these are republican, their position is different from that of an American State from the fact that the confederation to which they belong is an empire. In the right of suffrage the empire is more democratic than Berlin and other Prussian cities: in the former, universal suffrage obtains; in the latter, the right of voting depends upon qualifications. Every male inhabitant of Berlin who is a Prussian and twenty-four years of age is a voter, provided (1) he has lived in the city one year; (2) is not dependent upon a father or a guardian, but has his own household (*einen eigenen Hausstand*) and enjoys control over his own property; (3) has for a year received no alms from public funds; (4) has paid all his municipal taxes during the last year; and (5, *a*) possesses a house, or (*b*) pursues a trade with two employees, or (*c*) pays an income tax—which implies an income of $750 (3,000 marks), or (*d*) pays a class tax (*Klassensteuer*) of $1 50 (6 marks), which would probably include all whose income exceeded $150.

While these regulations exclude paupers and dependents, they would scarcely prevent any industrious, independent laborer from voting. In 1876 there were 145,903 voters in a population of 979,860. In 1874 there were 118,302 who had the right to vote in municipal elections, while 136,052 inhabitants of Berlin enjoyed the right of voting in the Imperial elections. The difference is, after all, considerable, amounting to nearly 18,000, or over thirteen per centum. Perhaps the problem of governing New York would be an easier one if thirteen per centum of the poorest and most dependent voters were disfranchised. The advantage of the regulations in Berlin is that they exclude no class, save the class of paupers, dependents, and vagabonds. Every honest, industrious laborer has his vote. The German theory is that the interests of municipal freedom require caution in granting the suffrage. The politically dangerous elements are so strong in cities, that an increased state control might otherwise become unavoidable.

There exists, however, in Berlin as in other Prussian cities, an arrangement which gives to the wealthy greater influence than to the poor. The voters are divided into three classes according to the taxes they pay. The highest taxpayers are placed in the first class. This begins with the citizen who pays the highest tax, and ends when enough of the most considerable taxpayers are included, so that the sum total of the taxes they pay is equal to one third of all the taxes paid by all the citizens of the municipality. The second class begins where the first leaves off, and goes far enough down to include the second third of the entire tax. The remaining citizens form the third class. Each class elects the same number of representatives to the municipal assembly, and each has, consequently, the same influence in the city government, since all the power of the voters is exercised through their representatives. In 1876, a trifle over 2.5 per centum of the voters paid one third of the taxes, and consequently belonged to the first class. About seven per centum of the voters paid the second third of the entire tax, and belonged to the second class. Some ninety per centum of the citizens belonged to the third class, and in municipal government had in consequence only half the influence of the ten per centum of the voters comprising the two upper classes.

* The writer has already described the methods and expenses of street cleaning in Berlin in an article published in the *Evening Post*, April 6, 1881.

† The population in 1880 was 1,118,630.

* A mark is $0.238.

THE QUARREL OF LORDS AND COMMONS OVER THE IRISH LAND ACT.

LONDON, March 7-9, 1882.

WE have just experienced another of those sudden storms which now sweep so often over the troubled sea of English politics; and, like most of our storms, it had its origin in the west—that is, in Ireland. It was not, however, due to those from whom disturbances are usually expected—the Irish National party—but, on the contrary, to the Irish landlords, or, as they call themselves, the English garrison in Ireland. They were, of course, extremely annoyed by the passing of the Land Act of last session, which they accepted only because there seemed no hope of resistance, and because it opened up a prospect of their getting some part of their rents paid, even if less than they had hitherto claimed. When the Act began to be put in force this winter, when the Judges of the Land Court, with their Assistant Commissioners, set to work to fix rents all over Ireland, they watched the proceedings first with anxious curiosity, then with alarm, lastly with rage. In the great majority of cases rents have been reduced, sometimes as much as twenty-five or thirty per cent. Such a reduction of course means much more than it seems to mean, because the landlord usually has to pay the interest on mortgages, and other charges, portions for younger children, and so forth, out of the gross rental, so that what he keeps for himself may be a great deal less. Thus a reduction of twenty-five per cent. on a gross rental may mean a reduction of fifty per cent. on his net receipts.

The irritation of the landlord class found vent in attacks on the Land Court and their assistants; charges that they were administering the act in a partisan spirit and straining its language against the landowner; repeated cries for compensation from the imperial treasury. Public opinion in England was not much moved by these complaints. It thought that the general reduction of rents proved that rents had been excessive. It heard the tenant farmers alleging on the other side that the reductions made had been insufficient. While admitting that the case of the poorer Irish landowners was a hard one, it felt in a vague way that they were suffering for the faults of themselves and their predecessors, and that their condition would have been even worse but for the intervention of the English Parliament; for if they were left to the tender mercies of the Irish population, they would probably be driven off the land altogether. And the English public generally had become so utterly weary of Irish questions that it was plainly indisposed to spend time in discussing landlords' grievances, so soon after Parliament had passed an act which was intended to set land questions on a new footing. Perceiving, therefore, that they had little to hope from the House of Commons or from popular sympathy in England, the Irish landowning party bethought themselves of that branch of the Legislature in which they and their friends are supreme. They moved in the House of Lords for a committee to inquire into the working of the Land Act, partly, as is believed, with the object of deterring the Land Commissioners from further reductions of rent, partly in order to gather materials on which to build a case for compensating those landlords whose rents have been reduced. The Government opposed the proposition, alleging that the Act had been far too short a time in operation for such an inquiry to do anything but mischief. However, Lord Salisbury supported the Irish peers, so the committee was granted by a large majority. Mr. Gladstone promptly gave notice in the House of Commons of a resolution declaring that any inquiry at the present moment would tend to defeat the working of the Act, and must be injurious to good government in Ireland. This pointed to a collision between the two Houses, and at once sent up the political thermometer as nothing but a constitutional question can do.

Opinion was much divided. Of course regular Tory partisans applauded the vigor of the House of Lords in acting on its own responsibility, and regular Radical partisans welcomed the prompt answer of the Government, and the opportunity of attacking the House of Lords which the conflict provided them with. But sensible people generally regretted the whole affair. The House of Lords was blamed, not only by its political opponents, but even by many Conservatives, who thought that it had ventured into an untenable position, and shown itself once more in the somewhat odious attitude, dangerous to its own stability, of a body thinking less of the legislative functions which the Constitution gives it than of the private interests of its members as great landowners. They felt it to be a mistake for the great Tory party to allow itself to be, so to speak, "captured" by the Irish landlords; and many were the secret murmurs against the precipitancy of Lord Salisbury, who had suffered himself (it was said) to be led astray by the factious Irish partisanship of such an Orangeman as Lord Cairns. Liberals, on the other hand, although they admitted that the Government could not pass over the appointment of the Lords Committee, and could but seek to parry a blow aimed so directly at the Land Act of last session, asked whether greater efforts might not have been made to arrive at some compromise, and quietly to persuade the leading Conservative Peers to minimize the inquiries of the committee, or turn them to some harmless direction. It was not merely that moderate Liberals shrank from anything like a constitutional struggle, feeling that an old ship like our Constitution should be as little strained as possible; they saw with alarm the prospect of an expenditure of time which would sadly delay a decision on the new rules of parliamentary procedure, and in fact throw into disorder the whole business of the session. There was thus a good deal of despondency and vexation diffused through the Liberal party, which, coming on the top of a certain amount of discontent regarding some of the rules of procedure proposed by Mr. Gladstone, produced a whole crop of alarming rumors. People went about saying that the Liberal party was breaking in pieces, that the Cabinet was itself divided, that a dissolution was impending. As usually happens, each rumor, however improbable in itself, lent a kind of color to other improbable stories. We seemed to have suddenly drifted into a great crisis, and the Irish landlords had at least the satisfaction of believing that they had created more alarm than they ever expected.

Just when the disquietude had reached its height, one Saturday afternoon Mr. Gladstone sent out a lithographed invitation to all the members of the Liberal party to meet him at his house on the following Monday. Such gatherings of a political party are sufficiently uncommon among us for the news of one to create some sensation. Mr. Gladstone has rarely used them—so rarely, that he has been charged with leading his party too despotically, instead of taking them, as Lord Beaconsfield did or appeared to do, into his confidence by personal interviews. This further heightened the curiosity to know what the Prime Minister had to say or intended to do. Many people affirmed that he would announce his resignation, or at least a dissolution of Parliament, and our club quidnuncs had a fine time of it on the Sunday which elapsed between the notice and meeting. Sunday is, *par excellence*, the day of gossip and unbridled credulity in this news-loving town. Monday, at 3 o'clock, saw the Liberal members of the House of Commons surging into the Premier's official residence in Downing Street, in such a crowd that they filled, not only the large Deputation Room, but a long corridor which leads to it, whence nothing could be seen and little heard of the proceedings. Over three hundred had assembled. So far from talking of resignation or dissolution, Mr. Gladstone stated, with even more than his usual vehemence, his determination to persevere with his resolution condemning an inquiry into the Land Act, and set forth his reasons for this course, asking his assembled supporters if they had anything to say on the subject. It would not have been an easy task to dissuade a course the Ministry were so strongly committed to; far more difficult, indeed, to have differed from Mr. Gladstone in his own house than in the House of Commons. However, it really seemed as if everybody was agreed, and earnestly agreed, to stand by the Government. People were pleased at having been called together in this unusual way; they took it as a compliment to themselves. They were thrilled, "exalted," as the French say, by the idea that a crisis had arrived. They were stimulated by the sympathy of numbers; one after another got up to express shortly his complete approval of the course the Government had taken, and unabated loyalty to the Ministry. An atmosphere of effusion, of fraternity pervaded the meeting, and when it broke up, after fifty minutes, the members walked down through the heavy rain that had begun to fall to Westminster Hall, filled with a sort of enthusiasm sufficiently rare among our legislators. The results were seen when, an hour afterward, Mr. Gladstone moved the suspension of the other orders, that he might bring on his resolution. Sir Stafford Northcote, as leader of the Tory party, opposed this proposal, but in a weak and half-hearted way. In fact, he and his friends were cowed by the jubilant ardor with which their meeting had inspired the Liberals, and which rose to its highest point when, after a short debate, they defeated the combined forces of Tories and Irish Parnellites by the unusually large majority of 133. The Parnellites opposed, because they oppose whatever the Ministry proposes, but also because they desire an opportunity of pointing out, not that the Land Act is, as the Tories say, too strong, but that it is too weak. Then the resolution itself was brought forward by Mr. Gladstone in a speech not only singularly powerful, but remarkable for the tact with which, while outwardly respectful to the Lords, he contrasted their irresponsible position and non-representative character with the place which the House of Commons holds as the really sovereign power in the state. This tribute to its greatness is a theme which the Assembly itself enjoys, and it is traditionally popular in the country.

Accordingly a great impression was made all over England and Scotland as well as in Parliament itself, and the Liberal party seemed to have passed at one bound from depression and disquietude to a temper of triumphant confidence and hearty harmony. Had it been possible to proceed briskly with the debate and finish it while the echoes of Mr. Gladstone's voice were still ringing in men's ears, the House of Lords would probably have paused and ultimately abandoned its committee. But under our cumbrous parliamentary system, this could not be done. Votes in Supply had to be interposed, private members' rights brought up other subjects for debate, and when the discussion on the resolution was resumed, the landlord party caught at the opportunity of venting its lamentations with a prolixity which drove away the audience and made it feel sick of the whole business. At the time of writing these lines a division has

not yet, after ten days, been taken, and may probably not be taken for three days more. Meanwhile the Lords Committee has set to work—various proposals for a compromise which passed between Lords Salisbury and Cairns and the Government having come to nothing—and has called Irish witnesses before it. Mr. Forster refused to appear, but some of the officials of the Land Commission have already presented themselves. No practical result, except a further unsettling of men's minds in Ireland, is likely to follow; but unhappily a precious fortnight of Parliamentary time will have been wasted over this unprofitable dispute. The blame of having begun it rests with the House of Lords, but the mischief tells upon the Government, who suffer in public estimation for everything that goes wrong. Already the enthusiasm which Mr. Gladstone awoke ten days ago has begun to die away, and the people say to one another that the session will be a wasted one. Everything now depends on the success of the Government not merely in carrying their new rules of procedure, but in carrying them within a reasonable time.

The recent shooting at the Queen has given us cause once more to be astonished at the ignorance of English public affairs in which the press of the European continent is plunged. They have attributed a political significance to this act of a crazy and half-starved vagabond, and have talked about Nihilism, Socialism, Fenianism, and so forth in the usual strain of that philosophic pedantry or fanciful ingenuity which, in Germany and in France respectively, insists on seeing deep into a millstone. The occurrence has made very little sensation in England, just because everybody knew that it had no significance whatever, either political or social. No one could draw from it even so much of a moral as was drawn from Guiteau's act, because, although the offender may turn out to have been not more absolutely abnormal than Guiteau, he does not belong to any class, and cannot be said to have been, in however slight a degree, the product of any set of influences, except of those low physical conditions which disorder men's brains, and make the love of notoriety the parent of crime. Had there been the least possibility of connecting him with Fenianism, it would have been seized on. Happily there has been none. Y.

THE TYRANNY OF MINORITIES IN ENGLAND.

LONDON, March 1, 1882.

"NOTHING is more surprising to those who consider human affairs with a philosophical eye than to see the readiness with which the many are governed by the few, and to observe the implicit submission with which men resign their own sentiments and passions to those of their rulers."

This remark of Hume's has a far wider scope than he gives to it. Nothing is more surprising than the power of minorities. In England, at least, the people—in other words, the majority—are in theory king. The historical forms of a monarchical constitution mask this fact, but no statesman, no practical politician, no man who is not the slave to mere words and formulas, hesitates to admit that any measure supported by a decisive majority of the House of Commons, and deliberately desired by the constituencies whom the House represent, would undoubtedly become law. The monarchy would vanish, the Union would be dissolved, the moment that a decisive majority of the electors wished to get rid of the throne or became supporters of Home Rule. Yet for all this, every observer knows that the most essential fact in English public life is the influence of minorities. Commoners like to be led by Lords. Workingmen distrust artisans. The very committee who propose what is called a workingman candidate for election hardly wish for his success; they are at times suspected of casting ballots against their own nominee. Hence England is governed by rich men. No legislature in the world represents such a mass of wealth as the two Houses of Parliament.

Whether this influence of minorities is on the whole to be deplored or to be admired is a question of speculation. The existence of this influence is a matter of fact. Influence is power, and power is always liable to abuse. What is to be noted is, that the power of minorities is fully as liable to abuse as the power of majorities. This, indeed, is often tacitly denied. A minority is often assumed to possess—just because it is a minority—some special claims to wisdom; the weight of a small number of persons must, it is fancied, since it cannot depend upon numerical superiority, rest at bottom on reason and argument. This, however, is not so. Minorities no less than majorities have erred, and will err. It is true, no doubt, that

> "The people's voice is surely very odd:
> It is, and it is not, the voice of God."

But it is no less true that crotchet-mongers and fanatics are not generally persons of sound judgment, and that the "man in a minority of one," who ought, according to some philosophers, to be the wisest of the wise, usually is, or ought to be, the inhabitant of a lunatic asylum.

Nor is the influence of small bodies of necessity based on legitimate grounds. Minorities constantly owe their supremacy to illegitimate sources of power. In hundreds of instances social arrangements, based on the truest theories and approved by the wide experience of competent judges, can, from the nature of things, be carried out (if at all) only by something like the united action of all the persons concerned. When this is so, a minority possess, and constantly attempt to abuse, the power of veto. Thousands upon thousands of all classes are assured that it is a blessing that trade should be suspended on Sunday; yet if one tradesman in ten thousand opened his shop, the Sunday rest would be at an end: his rivals could not compete with a trader who gained each year one-seventh more than themselves. The law enforces combined action—the law, that is to say, protects the majority from the tyranny of the minority. A small class, again, are frequently united by the bonds of fanaticism or of self-interest; if it were not for the law, this union would more often than not give to minorities most disastrous triumphs. The anti-vaccinators would enforce their views at once, if the courts did not intervene. In this instance, a minority combines twofold power. The liberty of one person in ten thousand to leave his children unvaccinated would render abortive the scheme of medical prevention. The anti-vaccinators are enthusiasts, their opponents are men of sense standing on the defensive. The struggle as it is cannot be termed unequal; the victory of ignorance, prejudice, and enthusiasm is one of the possibilities of the future. Protected interests, again, proverbially die hard. Every member of a privileged class fights with tooth and nail for his privileges; the public are languid defenders of the public good; what is everybody's business is nobody's business. London is without a real municipality; the funds of the city companies are employed on purposes which are either useless or noxious. Yet the municipal reform of London makes no progress: a class defeats the nation—a minority triumphs.

This point, however, needs, I think, hardly to be pressed upon your readers. The persons really interested in opposing civil-service reform, or in supporting the misgovernment of New York, are, I conjecture, few if compared with the citizens of the whole Union or with the citizens of the State; but every *Nation* I read tells me that interested minorities are at least as hard to defeat in America as in England. The whole history of protection is, in fact, a history of the success with which persons banded together in virtue of a common "sinister interest" (to use the expression of Bentham) can override the interest of the majority of the inhabitants of the civilized world. A small battalion of zealous and disciplined troops can hold at bay thousands of undisciplined, apathetic, and disunited assailants. The triumph of free trade in England is precisely one of those exceptions which prove the rule. The pressing and obvious interest of the manufacturers was pitted against the apparent interest of the landowners. As it happened, the interest of the cotton lords was the interest of the nation. Classes fell out, and the nation came by its own.

I dwell on the obvious but often forgotten truth that countries suffer from the tyranny of minorities, because it is a truth which has a very close bearing on a good number of questions now occupying and perplexing the minds of Englishmen. The country has reached that stage of political development in which every one admits that the will of the people must, in the last resort, be the sovereign arbiter of all political controversies, but in which the habit of yielding loyal obedience to the popular will is not yet fully established. The genuine and most creditable respect felt by Englishmen for individual liberty combines, among the upper classes at least, with anti-democratic sentiment to produce a very considerable amount of confusion on all sides as to the extent, the nature, and the limits of the rights of minorities. At the moment there is, I conceive, very considerable peril that the rights of the whole nation as represented by the majority may be in several respects sacrificed out of undue deference to the supposed claims of minorities. There is, for instance, current a notion (which is the more dangerous because it is the perversion of a fine and noble idea) that no man can be rightly punished or made to obey the law whose disobedience arises from following the dictates of his conscience. Hence the difficulty of dealing with the martyrs of the anti-vaccination craze. There are members of Parliament who apparently hold that while vaccination ought to be enforced by law, no one ought to be subjected to the penalties by which alone the law can be enforced. From the same source arises all the embarrassment in dealing with the Rev. Mr. Green and clerics of his stamp. These gentlemen demand, in perfect good faith, the right to remain officials of a church of which they disobey the laws. I am quite aware that this is not the way in which they put their case. Mr. Green's view would be that he obeyed what he held to be the law of the Church, while disobeying the misinterpretations put upon the law by the courts. The curious point, with which alone I am concerned, is, not the peculiarity of his views, but the attitude taken up by great numbers of persons who have no sympathy with Ritualism. They grant that Mr. Green disobeys the law; they grant that the law ought somehow to be upheld; but they cannot feel easy in their minds to see a man punished for doing what he holds to be right. A conscientious man is, a great number of people more than half believe, beyond the moral jurisdiction of the courts. A convicted briber ought not, it was urged the other day, to be sent to prison, because bribery was no crime in his eyes. The practical result of this sentiment is that a minority of a minority rule the National Church. The mass of churchgoers have, there is every reason to suppose, no desire for any material change; the clergy are a minority among churchmen; out-

and-out Ritualists are a minority among the clergy: yet thoroughpaced Ritualists defy the law. It is more than possible that Mr. Green and his fellows will win the day, and that, in spite of the wishes of the majority of churchmen, the National Church will more and more closely adopt practices not in harmony with the belief of the nation. When this happens, the Anglican body will cease to be the National Church. Such a result, be it bad or good, will in the main flow from the difficulty of defeating a conscientious minority.

Exactly the same confusion of opinion or sentiment which makes men who hold the Ritualists to be wrong in breaking the law, feel as though it were persecution to punish Ritualists for a breach of law, is a source of a good deal of the hesitation in English dealings with Ireland. One set of persons try hard to persuade themselves, in spite of all evidence to the contrary, that the Home Rulers cannot be, what I have no doubt that many of them are, sincere believers in their own political creed. Another set of English critics, recognizing the patent fact that Mr. Parnell and many of his followers are conscientious fanatics, find great difficulty in approving any mode of proceeding which may involve the punishment of crimes against the state when committed by conscientious criminals. I have found men so influenced by the respect supposed to be due to the irregularities of conscientious fanatics as to look with singular leniency on the roughs who, to express their disapproval of coercion, have attempted to set up a Coercion Act on their own behalf, under which Liberals such as Mr. Bryce and Sir Charles Dilke are to be prevented by main force from addressing their constituents. The claim of a discontented minority to put an end to free speech in London has been forcibly put down by the action of the police. But an observer who turns his eyes from the misdoings of three or four hundred Irish laborers, who cannot with any fairness be taken to represent the immense Irish population of the capital, to the proceedings of the wealthy Conservative party, will find instructive instances of the arrogance, the power, and the very possible tyranny of a minority.

The Tories represent at this moment a defeated minority; yet, under the guidance of Lord Salisbury, they are attempting to usurp the rights of the nation. If any one thinks this language too strong, let him look to what has happened in the House of Lords. From the artificial constitution of that body the Tory party has for more than a century commanded an immense majority in the Upper House. Every other part of the Constitution has changed; the peerage has been untouched by the hand of reform. Hence, whatever Minister has been in power, were it Russell, Aberdeen, Palmerston, or Disraeli, the Peers have always had the power, if they gave effect to their theoretical rights, of opposing a veto on every measure which the Liberals of the day approved. As a matter of fact, the influence of the Peers has directly or indirectly delayed, hampered, or maimed every scheme of reform. The House, however, have been hitherto influenced by the spirit of prudence, and have in practice never pushed their rights to anything like their theoretical limits. The Duke of Wellington and Peel impressed on their followers two maxims: the battle of Conservatism was to be fought in the Commons; the Queen's Government was to be carried on. Each of these principles has now been for the moment thrown to the winds. The Committee on the Land Act is a deliberate attempt to nullify the effect of legislation approved by the nation and passed by vast majorities through the Commons. The Committee, further, if it carries out the intention of those who demanded it, will fatally weaken the executive, and at the same time interfere with the action of the judicature. The House represent nothing but the hatred, well or ill founded, of landowners to the Irish Land Act. The House are therefore the organ of a minority. They claim to override the deliberate decision of the nation. The demand no doubt will be waived or compromised—this, at least, is my expectation. That the claim should have been made shows how far a minority of rich men may push their ideas of their own rights.

But the temporary error of the Peers is a far less serious matter than the attitude taken up by the Conservatives of the House of Commons. Any one who reads the English papers will know that obstruction threatens to bring Parliamentary government into discredit. Any one who carefully studies modern Parliamentary history will easily satisfy himself that, while the work to be done by Parliament is tenfold greater than it was, say, at the beginning of the century, the mass of talk talked in Parliament has increased in at least an equal degree. The curtailed reports of the papers give no idea of the volume and the inanity of Parliamentary loquacity. The disease is patent; the cure is equally clear. The Ministry propose that the House of Commons should adopt rules under which a majority may say that the time has come when debate must be closed. If the Ministerial proposals have a defect, it is that they clog the exercise of this right with far too many provisos and safeguards. I need not, I think, argue before the American public that the enforcing of what it is now the fashion to call the closure is essential to the due transaction of Parliamentary business. The matter to which I call attention is the policy of the Conservatives. They in effect challenge the right of a bare majority to close debate at all. They assert each member's illimitable right to the indulgence in unlimited twaddle. The willingness of Tories to place the right of closure in the hands, say, of a two-thirds majority, or to adopt measures which I have heard described as the "personal clôture"—*i.e.*, devices by which obnoxious Home Rulers may be silenced—makes the Tory case all the weaker. To give power into the hands of a two-thirds majority is to give an infinite opening for intrigue. It would mean in many cases nothing less than conferring on the Opposition a new right of veto. The experience of last session proves, I am told, that this is no idle conjecture. If any minority needs special protection (which I do not admit), it is a body such as the Home Rulers, which, being unpopular in England, may, if it does not obtain a hearing in Parliament, not obtain a hearing at all. The noticeable matter is, as I have already insisted, that the Conservatives at bottom object to that supremacy of the majority which is the basis of English institutions.

The reason is obvious: under Mr. Disraeli's guidance, or misguidance, the Conservatives took a leap in the dark. They made the town constituencies really democratic. They are now, consciously or not, alarmed at their own handiwork. The majority of the House are likely to be influenced by democratic sentiment. The people may begin to govern as well as reign; the Tories are therefore bent on tying the hands of the sovereign. This is the open secret of the new notion that the majority of the House of Commons is unfit to determine the course of business. To tell a Conservative that the machinery of Parliament is antiquated and unsuited for its present work, is to waste one's breath, for no Tory really wishes that a machine should work rapidly which is all but certain to turn out articles of democratic workmanship. The Tory position is quite intelligible, though a critic may fairly regret that it should be defended under the show of a factitious and unnatural anxiety for freedom of debate. While debates are reported, while the Government of to-day is under the perpetual expectation of becoming the Opposition of to-morrow, while the press is unshackled, while public meetings are free, it is idle for any English party to affect fear of being gagged. The true danger is, that the efficiency and the dignity of Parliament should be sacrificed to the exorbitant claims of Conservative sensitiveness. Whoever observes the "readiness with which the many are governed by the few" may understand that in a country where wealth, social distinction, and rank have such weight as in England, the peril of the moment may well be the despotism of a Conservative minority.

A. V. Dicey.

RECENT ARCHÆOLOGICAL DISCOVERIES IN PHRYGIA.

Athens, February 10, 1882.

During the autumn of 1881 Mr. W. M. Ramsay, a travelling student in archæology from the University of Oxford, made an expedition into the interior of Asia Minor, which resulted in the discovery of a great number of Phrygian rock-cut tombs. Having previously visited some of the Phrygian monuments, Mr. Ramsay saw the importance of securing accurate drawings of them; and as the Hellenic Society offered to send an artist for this purpose, he started on a second excursion last October. Taking a route seldom travelled over the highlands of the interior, the party came upon immense rock cemeteries, the greater part of which had never been discovered. The most interesting of these were at the head of the valley of the Sangarius, the divine river of ancient Phrygia and the mythical parent of its kings. Near the source of one of the western branches of the river, on the top of the highest part of a broad plateau, two extensive cemeteries were found. The northern one has been known in part a long time. It was discovered by Leake in 1820. In a secluded pine-covered valley that winds between high hills lie hundreds of tombs of all styles and forms and sizes. The most remarkable among them is the previously-known tomb which bears a Phrygian inscription containing the words "To King Midas." Its entrance has never been found. The perpendicular face of the rock, seventy feet high, is covered with beautifully carved geometrical patterns, most of which are in excellent condition, the edges being as clear as when first cut. As the rock-cut tomb of the Syrian was an imitation of his modern dwelling, so this Phrygian ornamentation is supposed to be derived from the woven texture of the nomad's primitive tent.

About a mile from the cemetery, on the side of the valley, is a curious little fort, all the parts of which—walls, gates, cisterns, houses, and underground passageway leading out to the side of the hill—are cut with great delicacy out of the solid rock. It is in a perfect state of preservation. Though this fort was previously known, there is no evidence that any former traveller climbed the cliff above it, where, on the plateau overlooking the valley, an extensive city lies, exceedingly curious and full of interesting remains, carved from the rock. Its sculptures and altars are particularly numerous. Beside one of the latter is carved a rude figure of Cybele, which is probably the oldest known representation of the goddess.

The second great rock-cut cemetery, twenty miles due south of the former, was never known before. It resembles the other in general character, and contains hundreds of tombs, the con-

struction of which dates from the earliest times to the Christian era, probably in unbroken series. Corresponding to the tomb of Midas in the first cemetery, and fully equal to it in interest, is a large tomb which projects in the form of a cube, forty feet in dimensions, from the side of a hill. The grave is a chamber inside the rock, which is entered by small windows cut in the centre of the front of the cube, twenty feet above the ground. Over the entrance an obelisk is carved in relief, and on each side of this an enormous lion, twenty feet long, stands rampant. Underneath each of the lions lies a little cub.

This lion tomb bears a striking resemblance to the famous lion gate of Mykenæ. The gate was the most sacred part of an ancient city, and among the most sacred of its structures were the tombs; the lions found on these two monuments may, therefore, be considered to have originated from one idea. This idea, according to Mr. Ramsay's theory, was native to Phrygia. He found as many as nine examples of the kind, ranging from the archaic one above described, which is at least as early as 800 B. C., down through a series of gradually modified examples to as late a period as 400 B. C.; and he concludes from the character of these Phrygian sculptures that the most archaic of them—probably far older than the date above assigned—belong to a period anterior to that prehistoric age of Hellas, the heroic age of the Pelopidæ, of which the lion-gate of Mykenæ is the only sculptural monument that remains. If this be indeed the case, Mr. Ramsay's discovery seems to confirm the tradition previously recognized as the most trustworthy of all the Greek heroic myths, that the Pelopidæ, those powerful families who impressed a foreign civilization upon the rude tribes of Hellas, were emigrants from Asia Minor.

The artist of Mr. Ramsay's party has made a series of drawings which include about twenty-five of the tombs. All previous representations of these have been far from correct, and the several representations of the Midas tomb which have been published bear no resemblance to each other. The best of them is Texier's, which is rather remarkable, as it is the only case in which a drawing of his is known to have been tolerably accurate. Mr. Ramsay's collection will therefore throw an immense amount of light on Phrygian art, a subject hitherto practically unknown. Everything has pointed to a probable connection between the art of Greece and that of Central Asia Minor. The ornamentation of archaic Greek vases—especially the palmette and lotos alternating in a band, and the early form of the acroteria — exhibits a remarkable analogy to many Phrygian works. But though every writer on Greek art has assumed a relation between that and the art of Phrygia, no one has been able to do more than lament the lack of sufficient material to trace the connection satisfactorily. Such material has now been found. Whether we believe with the majority of archæologists that Greek art was derived from Phrygian, or hold to the opposite theory that the art of Phrygia was an outgrowth of the Greek, it is evident that Mr. Ramsay's discovery has confirmed beyond controversy the existence of an important link between the two. He concludes that the testimony of the great rock cemeteries is sufficient evidence that Phrygian art was the parent of the Greek. The rock sculptures in relief enable us, he thinks, to trace one hieratic representation all the way from Babylon to Greece by a series of examples, which include one discovered last year in Cappadocia, one in Phrygia, and the so-called Niobe on Mount Sipylos, near Smyrna, from which is derived one of the commonest hieratic representations of the worship of Cybele in Hellas.

Mr. Ramsay obtained over two hundred unpublished Greek and Latin inscriptions in Pontus, Cappadocia, Galatia, and Phrygia, besides securing accurate copies of all the inscriptions previously known in the old Phrygian language—a work never satisfactorily done before—and two new Phrygian inscriptions, one of which contains the name of the goddess Cybele. The Phrygian alphabet is almost identical with the early Greek at the time previous to the introduction of the non-Phœnician characters. Its inscriptions probably belong to the seventh century B. C. Mr. Ramsay was also able to clear up many points in the geography of the country, and to place accurately several towns which were formerly assigned to wrong positions.

The valuable results of this short expedition, made at slight expense, indicate how much work might be done by the contemplated American School of Archæology at Athens. It is possible to travel in the interior of Asia Minor with comfort and safety, though a stranger may easily get into difficulties, unless properly informed. Mr. Ramsay owes his training in this respect to Sir Charles Wilson, the British Consul-General of Anatolia, with whom he made his first journey. Similar opportunities are often offered, especially to residents in the East, and a school of young men, trained to distinguish the character of ancient remains and form intelligent conclusions, might accomplish a large amount of interesting and important archæological work. C. W. B.

Correspondence.

THE DALMATIAN REVOLT.

To the Editor of The Nation:

Sir: I read in your excellent journal of February 16 an essay, entitled the "Revolt in Dalmatia," written by Mr. Edward A. Freeman. Having lived myself for years in Austria, and visited in 1878 the then newly-occupied provinces of Bosnia and Herzegovina, I find in the article alluded to—to say the least—many unreasonable exaggerations and inimical assertions against Austria, which may lead persons unacquainted with that land to form an entirely wrong idea. All the late disturbances on the eastern side of the Adriatic have been stirred up by foreign influence, and the present insurrection in the Bocche di Cattaro is, all over Europe, ascribed to Panslavic and Russian intrigues, favored, however, by the wild and stubborn character of the Bocchese, who, used to unfettered liberty on their mountain heights, defy every effort to bring them to a settled and more civilized mode of living. I see no reason why the Bocchese, who enjoy the same rights and are governed by the same laws as all other Austrian Slavs, should be exempt from military service, while their brethren of the same race submit without a murmur to this hard, but in the present state of European affairs, inevitable evil.

Every man who knows the enmity and jealousy of the different races living together in the Austro-Hungarian Empire will admit that the only possible way to govern such an aggregation of different people is to satisfy the most powerful and numerous of them without wronging the weaker ones. This is what Emperor Francis Joseph is attempting to do, though it is a hard and ungracious task. The Germans and Hungarians are in Austria the bearers of civilization and progress, and the possessors of wealth, and are, therefore, aside from their numerical superiority over the Slavs, by right entitled to the influence they possess. The security of Austria and southeastern Europe requires that a lot of roughs—call them Bocchese, Krivoscier, or Herzegovzen—who at any moment may start afresh the so-called Eastern Question, be kept down; and an excellent way to attain this is by military service, in which these brave but otherwise unwelcome subjects learn at least to obey and respect the acknowledged authority of their country. It is, therefore, desirable in the highest degree for the peace of Europe that the "hired and kidnapped bondmen" (a new expression of Mr. Edward A. Freeman's for soldiers) of Emperor Francis Joseph should teach these eternal Bocchese brawlers that Austria is tired of having a lot of hirelings who, at every opportunity, are ready to fight the authority of their own country, provided they get paid for it, be the money furnished by the Russians, Panslavists, or any other race or nation which has an interest in bringing Austria into trouble.

Very respectfully, P. Knoch.

Portland, Oregon, March 5, 1882.

MEDICAL EXAMINATION OF APPLICANTS FOR PENSIONS.

To the Editor of The Nation:

Sir: As a matter touching pension frauds, something should be said in regard to pension-examining surgeons. The same Congress that perpetrated so great a swindle as the back-pay bill for a long time withheld the appropriation for paying medical examiners, and then cut the fees down to a dollar for each case There are pension boards in every city, and pension examiners in every village and hamlet, of the Union. They are required to attend to cases as they come in, or set apart Wednesday of each week for such examinations. They are to make a careful and thorough investigation of the case, often requiring instruments of precision which few possess or can use, and decide as to its origin in the service, its duration and termination, and then to fix a rate of pension, from a given scale, according to the disability. A decision is insisted on, and, if favorable, it is almost invariably sustained and the pension granted; if unfavorable, the result is shown further on. No competent surgeon would in private practice make such an examination for less than $5, even in the country; and no life-insurance company gets such work done for less than $3, and often pays $10. For the pittance of $1, duplicate accounts must be forwarded to Washington at the end of the quarter, there frequently to wait three months for approval, and then duplicate receipts must be forwarded to the local pension-agent before the money is received.

Being a member of the profession, I should be loth to say any surgeon would be dishonest; among so many, some must be incompetent, others err in judgment, some be sympathetic. Many of them were in the service and are now the recipients of pensions; if not, as age disables them they are looking up testimony and making application for themselves. The applicants are often their friends and patrons, and are pretty well informed by the pension solicitors who make or refuse a rate. In many cases a considerable sum of money is involved. In my circle, which is not large, I have been repeatedly offered gratuities of from five to five hundred dollars, if claims were allowed. With all confidence in my profession, it is not in human nature that some of its members should not accept a *douceur*. We are instructed to report all frauds on the Department; yet we have known few to be investigated, and never known a pension stopped. It is certain if once granted, except under an old rule of biennial examination, abrogated some time ago.

We have been more than suspicious that the pension attorneys at Washington had access to

our private reports; we are certain that they know our individual peculiarities, and if we disallow a claim, another order is easily obtained to another surgeon; and often this is repeated several times, until one is struck that will allow the claim. Time and persistence bring a pension to every one who can secure an order for an examination.

The much-ridiculed Sixty-Surgeon Bill of Commissioner Bentley would have obviated much of this evil, and have saved the Government millions of dollars, as well as the morals (the souls, I came near saying) of a large number of people. A less efficient remedy, that would still accomplish much, would be to pay a reasonable fee, and then make careful inquiry as to character and standing, from available sources, and diminish the number of examiners one-half. The office would then be respectable, and a long stride made toward honesty and economy.

Yours, etc., WINTER SMITH,
U. S. Examining-Surgeon.

JONES PRAIRIE, IOWA, March 15, 1882.

THE LIQUOR-TRAFFIC COMMISSION.

TO THE EDITOR OF THE NATION:

SIR: Your remarks in No. 872 of the *Nation* upon the passage of the Senate bill creating a commission to examine the relations of the liquor traffic to revenue, crime, etc., suggest several points of specific inquiry which should be covered by the investigations of such a body, in addition to those mentioned by you—viz.:

1. Can drunkenness in the mass be diminished in any way so effectually as by rendering it physically impossible for the intemperate to procure the means of intoxication?

2. Can this be practically accomplished without putting temperate drinkers under the same restrictions as the intemperate?

3. Has prohibitory legislation in America been at all successful in limiting the traffic in stimulants? If so, where and under what circumstances has it been most successful?

4. What is the exact amount of revenue derived in the United States from licenses to sell liquor?

5. What is, approximately, the amount of public expenditure that can be traced directly to drunkenness as its cause, in increased cost of police, criminal administration, support of the poor, the insane, etc.? And what is, approximately, the economic loss in diminished production, destruction of values by fire, accident, etc., resulting from drunkenness?

6. Are the advantages that would be secured by the abatement of drunkenness—if that can be effected by law—of sufficient magnitude to justify the infringement of the liberty of temperate drinkers; and will prohibitory legislation necessarily and under all circumstances, whether representing the will of a large majority of the voters or not, be followed by evils that will outweigh those arising from the amount of drunkenness which prevails under the license system?

These questions have, in a vague and general way, been variously answered heretofore by the advocates and opponents of prohibition respectively, but never, I think, in a manner that will command the entire confidence of dispassionate inquirers. It remains to be seen whether any commission appointed by Congress will examine this delicate, but infinitely important, subject with the necessary thoroughness and impartiality.—Respectfully, L. T.

BALTIMORE, March 18, 1882.

Notes.

A BIOGRAPHY of the late Dr. Leonard Bacon is contemplated by his family, and letters or other documents which might aid in its preparation are requested to be sent to the Misses Bacon, 247 Church Street, New Haven, Conn. They will be returned if desired.

An American author, Mr. Frederick May Holland, of Concord, Mass., whose 'Sordello' was published last year by G. P. Putnam's Sons, is about to help on the newly-organized enthusiasm over Robert Browning in England by publishing, through George Bell & Son, London, a volume of 'Stories' from that poet.

Porter & Coates, Philadelphia, have in press a volume embodying the American lectures of Dr. Edward A. Freeman, entitled 'The English People in their Three Homes, and the Practical Bearings of General European History.' It is brought out by special arrangement with the author.

White & Stokes, New York, announce 'Summer Gleanings,' by Rose Porter—a sort of floral diary, having on each page apt poetical selections, a space for pressed flowers, and others for jottings and sketches.

The *Moravian*, Bethlehem, Pa., is publishing a work of some importance to English readers—namely, a 'History of the Unitas Fratrum,' a church founded in the fifteenth century by the followers of Huss in Moravia and Bohemia. The author is Bishop Edmund de Schweinitz, the biographer of Zeisberger, who has gone to sources very few of which are in the English language.

We learn from the *Woman's Journal* that Mrs. Mary A. Livermore has copyrighted the title of a book, 'The Heavenly Side of the War,' which will embrace her experiences in connection with the work of the Sanitary Commission.

To say that Mr. Spofford's 'American Almanac for 1882' has appeared (New York: American News Co.) is sufficient for those who have ever had occasion to consult the four previous issues. There is no publication in this country comparable to it for the fulness and variety of its statistical contents, and the editor, the merchant, the banker, the politician, or the simple citizen desirous of information will seldom turn to it in vain.

The success of Josephine Pollard's 'The Decorative Sisters' appears to have been greater than a purely juvenile reception would account for. A. D. F. Randolph & Co. have just brought out a new edition with green cloth covers tied with yellow silk, and grotesquely æsthetically stamped or painted in bright colors. The book will, doubtless, continue to do service as a sort of polite satirical gift in the nature of a valentine.

The same publishers have employed hand-painting on the covers of 'Set Apart, and other Poems,' by the late Miss Frances Ridley Havergal, and of 'The Voice of St. John, or, The Story of the First Easter Day,' a poem, by the Rev. W. W. Newton.

The second volume in Houghton, Mifflin & Co.'s handsome uniform reprint of Bret Harte's complete works consists of 'The Luck of Roaring Camp,' and other stories.

Chief in point of interest of the contents of the *Journal of Social Science*, No. 15 (New York: Putnams), is the chapter on infant development, which, in addition to the papers read at Saratoga on the subject and some American observations, includes Taine's and Darwin's notable reports upon the progress of their own children in intelligence.

With the 13th part, the new 'Brockhaus' Conversations-Lexikon' (New York: L. W. Schmidt) reaches the rubric *Arbeiter*. The maps continue to be excellent—the Empire of Alexander the Great; Thebes (Ancient Egypt); and, on one sheet, Northeastern Africa, Arabia, and Lower Egypt.

Part V. of Reiss and Stübel's admirable work on the 'Necropolis of Ancon in Peru' (New York: Dodd, Mead & Co.), brings its ten additional scrupulously colored plates, embracing one landscape (in the foreground a deep grave of false-headed mummies); a rich aristocratic mummy sack, with some of the poorer and commoner sort; mummies with wig and ear ornaments; painted sepulchral tablets; numerous woollen stuffs, in the Gobelins style and otherwise, noticeably strong and sure in design and color; black earthenware, grotesque and shapely; and some red urns, simulating the human head and body, conceived with a degree of humor not commonly ascribed to the Peruvians.

No. 2 of vol. iv. of the *American Journal of Mathematics* is wholly occupied with a portion of the late Prof. Benjamin Peirce's memoir on Linear Associative Algebra, read before the National Academy of Sciences in 1870. It is annotated and to some extent revised by his son, Mr. Charles S. Peirce.

A writer in the current *American Journal of Philology* (vol. ii., No. 8) gives a sample page of the new Philological Society's Dictionary, and a very clear idea of the stupendous character of the work. It is now expected to make not less than six quarto volumes, each somewhat larger than Webster's Unabridged. It is gratifying to learn of the hearty coöperation of American readers in this undertaking, and a surprise to be told that the chief editor, Dr. Murray, is not financially able to devote his entire time to it.

A Dictionary of Belgian writers, with a catalogue of their publications, during the half century 1830–1880 ('Bibliographie Nationale'), has begun to appear at Brussels. It is very comprehensive, and promises to be bulky, and is, says the *Athenæum Belge*, magnificently printed.

—We very much regret having blundered last week in representing the *North American Review* to have been the medium of Dr. Le Plongeon's reports of his discoveries, whereas its correspondent is M. Désiré Charnay.

—"M. L." writes us from Rochester, N. Y.:

"In your interesting article on 'The Organization of College Faculties' the well-known line "Im engen Kreis verengert sich der Sinn," is not by Goethe, but, as you undoubtedly know, from the Prologue to 'Wallenstein's Lager,' by Schiller."

—"S. M. C." writes us from Keokuk, Iowa:

"Mr. Leigh Hunt, City Superintendent of Public Schools at Mt. Pleasant, Iowa, has had for several months in operation in them a system of school savings and the practical teaching of providence. In the absence of a savings bank he got one of the national banks to take the deposits of the school children upon a simple system of accounts. His instruction, given to both teachers and pupils, extends even to the primary classes. This method has worked well. Several hundred dollars of savings are already in the bank. Children are inventing methods of making money, while the attendance, interest, and scholarship of the schools seem noticeably improved by the experiment."

—The Wisconsin Assembly, we are glad to see, on March 15, by a vote of 58 to 33, passed a bill appropriating $100,000 for building in the centre of the Capitol Park, of fourteen acres, a secure edifice for the State Historical Society. The known disposition of the Senate, and the hearty approval of the Governor, make this vote equivalent to enactment. Legislative patronage of the Historical Society began in Wisconsin within six years after the State's admission into the Union, with a grant of $500 in the year 1854, when the volumes in its library were no more than fifty. The bounty was continued, and annually increased. In addition to one wing of the Capitol warmed, lighted, carpeted, and shelved at pub-

lic expense, the State has for many years paid the salaries of a secretary, three librarians, and janitor, and furnished $4,200 annually for the purchase of books. It has defrayed the expense of publishing twelve octavos (seven of historical collections and five of catalogues), and made a special appropriation to pay for binding. The Historical Society has itself a binding fund that now amounts to $10,000, but purposes not to use it till the income of it shall reach about $1,000 a year. The contractors are to be required to complete the Historical Hall so that possession can be taken of it on New Year's Day, 1884, or just thirty years after the State's first care for the infant Society. The Society has received many gifts from individuals, associations, and governments, domestic and foreign. After this new departure it cannot fail to receive more.

—*Lippincott's* for April contains for its leading illustrated article an account of life in Normandy, by Margaret Bertha Wright, who has evidently had opportunities of observation, but whose passion for "word-painting" needs to be a little restrained. For instance: "As I walked between unhedged patches of dimpling grain, I saw the opposite coast vaguely through a mist, shimmering like the wicked wimpling of absinthe." This is evidently a carefully composed sentence, but it is open to the objection that dimpling grain is such an unfamiliar idea that the reader feels that he ought to be led up to it more gently than this, while the statement that absinthe "wimples," wickedly or otherwise, or that a coast seen through a mist looks like absinthe when it wimples, raises in the mind a slight feeling of suspicion and incredulity which interferes a little with our enjoyment of the word-picture. George Newell Lovejoy, in some verses called "Disappointment," displays a good deal of ingenuity and fancy; the poem is better worth reading than most of the magazine poetry of the month, though it must be said that Disappointment and Truth are not either logically or poetically opposites. "Our Substitute for a Navy," by Charles F. Johnson, jr., is one of those unpatriotic articles with which the press now teems, which expose the condition of our navy to the gaze of other sea-going nations, and lead the Chilians to caricature us in their comic papers. The first sentence of the article, "The United States possess one of the finest navies of the world, considered strictly as bric-à-brac," is rather suggestive of a caricature itself. The pirate Kidd is always a fair subject for a magazine article, and Mr. Charles Burr Todd makes the most of it in a sketch of the career of that enterprising Scotchman, from his earliest appearance as master of a coasting vessel plying between Boston and New York, to his last sad end in Execution Dock. Piracy can hardly be said to be an attractive career any longer, but the teachers of youth may still draw a useful moral lesson as to the caducity of all success in life not based on a strict attention to duty, from the fact that Kidd was caught and hung after tasting the pleasures of piracy for only four brief years.

—The *Atlantic* for April opens with an article by Mr. John Fiske on "Europe before the Arrival of Man," which popularizes a good deal of geology for the general reader, and corrects for him also some of that vast stock of misinformation and vague error on the subject of the early history of the earth which he mistakes for science. To take one rather curious illustration, the general reader, being familiar with the fact that this history is divided by geologists into three periods, the primary, secondary, and tertiary, may very likely be in the habit of jumping at the conclusion that they are all of equal length. At any rate, when he learns that as a matter of fact "the beginning of the tertiary period carries us back barely *one-twentieth part* of the way toward the first beginning of fossil-bearing strata," he will, if he is a candid general reader, admit that he would have guessed a fraction much more like one-third. Mr. Fiske's explanation of this is as follows: "On the whole, the geologic record of the tertiary period is much more completely preserved than that of the two earlier periods. We see more clearly into the details of life at that time, and consequently have a more vivid picture of it before us; and this more vivid picture, as is natural, usurps an undue place in our minds." An article on "Shakespearean Operas," by A. E. Barr, recalls the recent reproduction of Thomas's "Hamlet" in this city, with Gerster in the rôle of *Ophelia*, formerly sung by Nilsson, and reminds us that Thomas is only one of a long line of composers who have failed to discover that Shakspere can never be made to fit into the mould of the Italian opera. In Italian opera the purpose of the music is the lyrical expression of primary, unintellectualized emotion, called forth by striking situations. Its *scenas* and *arias* are therefore much more nearly akin to the "points" of melodrama than to high tragedy of any school. The plays of Shakspere which lend themselves most readily to music are those which Shakspere himself interspersed with songs, such as "Midsummer Night's Dream," "The Tempest," and "As You Like It"—fanciful lyrical dramas, which have led to the production of some of the prettiest music in the world, but still not operatic music. Mr. Philip Bourke Marston writes a short article, introducing to our notice a new poet, Mr. Arthur J. Munby, the author of 'Dorothy,' a pastoral poem in alternate hexameters and pentameters. We have no space for any long extracts from the poem, and must content ourselves with pointing out to the able critics who are now engaged in analyzing this powerful work that short extracts are rather likely to deter the reader from venturing into its depths. For instance, the lines beginning:

> "Winter, she helped old John a laying down straw for the cattle,
> Cleaned out the stables and byres, nothing afraid of the bull,"

may be a deeply interesting and valuable contribution to English literature when taken in their proper connection, but when isolated and examined by themselves, they seem rather flat. Mr. Marston seems to think that "Dorothy" is a new kind of poem, but it belongs to the same school of two masterpieces of established reputation, Clough's "Bothie" and Goethe's "Hermann and Dorothea," both written by poets who, at least in versification, were more skilful than Mr. Munby. Elizabeth Stuart Phelps begins this month her "Doctor Zay," a story with a curious history, given in an introductory note addressed to Miss Phelps by Mr. Howells. In this he records the singular fact that before Miss Phelps had written her novel she gave him the outline of her plot, and that on hearing it he found that it dealt with the same situations and the same characters, to a certain degree, as his own "Dr. Breen's Practice," then already written and partly printed; that he urged her to complete it, and assured her that no one would for a moment suppose that she had borrowed any of it from him. There is certainly nothing in the opening chapters to suggest any such "conveyance"; indeed, we may frankly say that we think Miss Phelps's story, as far as it has gone, would be even better if it were a little less original.

—In the April *Harper's* not a few readers will turn first to Professor Gildersleeve's account of Pheidias, his Athena Parthenos, and the yard-high statuette copy of it discovered in Athens at the close of 1880, of which a side view from a photograph is given. They will be disappointed in nothing unless in the image itself, which undoubtedly has that "squab" look which Professor Gildersleeve ascribes to it, and in other respects (as in the right arm and hand) seems to fall considerably below the perfection of Attic sculpture. One interesting evidence of its being a mechanical reduction of the original, is the three marks, or measuring points, on the back of the Athena, and of the Victory which she holds in her hand. An incidental remark in this paper appeals to general experience, where the writer says: "I have sometimes fancied that the nationality makes itself felt even in photographs; that the French photographer, the German photographer, manages to give a Gallic or Teutonic deflection to the rays of the sun." Or, as we once heard it said of an American photographed abroad—we believe in Russia—"he looks as if he couldn't speak a word of English." Papers nominally lighter than the foregoing are Mr. George P. Lathrop's "Spanish Vistas" (Burgos and Madrid), and Mr. Ernest Ingersoll's "Silver San Juan," both copiously and beautifully illustrated. Mr. Lathrop succeeds in the difficult task of infusing freshness into the description of a bull-fight. Professor Woodberry begins what appears to be a popular "History of Wood-Engraving," eventually to become a book, unencumbered with foot-notes and references to authorities. In this first instalment he traverses ground familiar to all who have studied the "origins" of printing, but presents a facsimile of a hitherto unpublished woodcut of the Crucifixion (about 1445). Finally, we may mention Mr. Henry W. Lucy's intimate picture of Mr. Gladstone's domestic life at Hawarden. A somewhat new phase of the Premier's countenance is given in Mr. Kruell's able rendering of a London photograph.

—The March number of the *Rundschau* contains an article by Professor Haeckel describing his trip to India and his preparations for a scientific expedition to Ceylon. Through an irregularity of the mails, his second letter, in which he gives his impressions of Bombay, arrived before the first, and was printed in a previous number of Rodenberg's periodical. Professor Haeckel began his career as lecturer at the University of Jena more than twenty years ago. His vacations he has devoted, after the manner of his teacher, Johannes Müller, to systematic zoölogical experiments at the sea-coast, mostly along the Mediterranean, but also at Helgoland, Canary Islands, and the Red Sea. One of his earliest desires, stimulated by a perusal of the works of Humboldt, Schleiden, Kittlitz, and Darwin, was to visit the tropical regions; but he has had to wait till his forty-eighth year before this wish could be realized. Early in October last he left Jena on a six months' leave of absence, two of which were to be consumed by the journey, and four spent in Ceylon. Twenty, or even ten years ago, a scientific expedition required little more than a microscope and a few other simple instruments; whereas, Haeckel's outfit filled up sixteen trunks and boxes, only two of which contained his personal effects, the others being filled with physical and anatomical instruments, alcohol and other conserving fluids, glasses, nets, photographic apparatus, painters' materials, etc. It was his intention to include in his labors deep-sea dredging of the Indian Ocean; but he failed to secure the means required for such an expensive undertaking, which is all the more to be regretted as those regions are almost entirely unexplored, and it is now known that, contrary to the former supposition that animal life ceased at a depth of 2,000 feet, it really extends to 27,000 feet, and includes hitherto unknown animals of diverse classes, varying in the different zones like the mountain vegetation of different altitudes.

—On the principle of *nomen sit omen*, Haeckel attaches importance to the fact that the steamer which conveyed him who first named a whole class of animals Heliozoa bore the name of *Helios*, and that the first hotel he stopped at on his Indian tour was named "Elephant." The "zoölogical bias" is shown here in the classification of hotels he inserts, by the way. He thinks he has noticed on his numerous journeys that hotels can be divided into three classes—the zoölogical, the dubious, and the dynastic. These last, named after a prince or king, are almost always poor, the dubious are what their name implies, and the zoölogical, such as Golden Lion, Black Bear, etc., are usually good, especially for bachelors, artists, and naturalists. Of the four steamship lines between Europe and India, he gave the preference to the Austrian Lloyd as the most comfortable and the cheapest line, and one which on this as on previous occasions showed a willingness to extend to scientific tourists special favors and special accommodations. The voyage proved calm and monotonous, and the Professor apparently spent most of his time looking at the flying fishes, porpoises, and birds, and regretting that the motion of the ship was too rapid to allow him to catch some of the fine specimens of cœlenterata as they passed. He did not become seasick, but his "poor German-professor-stomach" found that three out of the five daily meals were quite sufficient for its needs. While the appetites of the other passengers increased every day, his own diminished, and he expresses amazement at the wonderful capacity of the Englishmen on board. Contrary to the general opinion, he thinks that the appetite of the English far surpasses that of the Germans. Of the passage through the Suez Canal, he says that whereas eight years ago it was the universal opinion that the expenses of the canal would always exceed the profits, the latter are now so considerable that they will soon yield a handsome profit. The greatest drawback at present is that the canal is too narrow to allow two ships to pass by each other, except at specially widened places at long intervals, so that hours are often wasted by one ship in waiting for another. In the next century probably either the canal will be widened or another one constructed, thus allowing one set of ships to go north and another south without interruption.

—In the triple issue, Nos. 10, 11, 12, of vol. xiii. of the Bulletin of the Essex Institute (Salem, Mass.) will be found some interesting "Notes on Forest Trees," contributed by Mr. John H. Sears, and made by him while collecting wood specimens for the Central Park Museum of Natural History last year in northern New York. Unexpectedly one meets with the following trace of popular superstition, which takes us back to the days of witchcraft and the evil eye. Mr. Sears is speaking of the Gray or Scrub Pine (*Pinus banksania*):

"This tree is known as the 'unlucky tree' by the people in this part of the country. The more observant ones call it a cross between the pine and spruce. I met several men of good general education who were convinced of the danger arising from this tree, and who cited cases of its malignant influences (similar to the stories told of the upas-tree of Java). It is considered dangerous to pass within ten feet of its limbs, and more so to women than to men. It is equally dangerous to cattle; so that whatever ill befalls a man, his family, or his cattle, if there is one of these trees on his land, it must be destroyed—burnt down by wood being piled around it, for no one would venture to cut it down."

—The "dictionary" catalogue seems likely to overrun one more country in its victorious course. Sig. Costantino Maes, vice-librarian of the Alessandrina at Rome, has prepared, unofficially, an index to the author-catalogue of that library, prefixing it with remarks (with which every one in America is familiar) about the utter insufficiency of an author-catalogue alone to assist students, and about the improbability that a classed catalogue will suit any one but its maker. He is enthusiastically in favor of the simple alphabetical order, "bella, semplice, antica guida e immutabile." Sig. Maes needs but one step more—to mix his authors and subjects in a single alphabet—and he will have a dictionary catalogue. It is noteworthy that he seems to be entirely ignorant that anybody before him has ever thought of an alphabetical subject-index. Probably English and American catalogues are scarce in the Alessandrina.

—We learn by telegraph of the death of Dr. John Muir, of Edinburgh, well known as one of the most meritorious of English Orientalists. Born at Glasgow in 1810, he went to India in the East India Company's service when only eighteen years old, and, after the full term of twenty-five years, returned, still in the prime of life, to pass more than another quarter century in just as faithful and devoted labor on behalf of India at home. A brother, Sir William Muir, distinguished himself in general political service, and has been for many years Governor of the Northwestern Provinces. John Muir's retiring disposition and strong literary taste led him into another line of activity and distinction. He acquired in India an unusual knowledge of Sanskrit, along with a facility of metrical composition in that language which he exhibited in a highly-esteemed little treatise in defence of Christianity, intended for Brahmin readers. After his return he made it the business of his life to help in all possible ways, with pen and purse, the comprehension by Europeans of Hindu institutions and their history—most especially, of Hindu religions. He published various articles in learned journals. He made metrical versions of passages from Sanskrit writers having an ethical character, which he printed privately and distributed among his friends; they have been recently collected to form one of the volumes of Trübner's Oriental Series. But his principal work has been his 'Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions,' in five volumes (the first four appearing in a second edition before the addition of the fifth in 1870), giving abundant and carefully selected (transliterated) extracts from the first sources of knowledge, with translations and explanations. This is a classic work, which every student of India keeps constantly within reach. He was also always on the lookout for deserving literary enterprises which he might encourage and aid; and many such have owed their success to his unreported generosity. He offered in 1846 a liberal prize at Cambridge for an exposition of the errors of Hindu philosophy. In 1862 he endowed a Sanskrit professorship in the University of Edinburgh; it was first held by Aufrecht, and now by Eggeling. Dr. Muir was a man of the most amiable character, estimable in all private as well as public relations, and, though he had his decided opinions of men as well as of things, absolutely averse to all controversy and strife.

—We extract the following tribute to Dr. Muir's scholarship from a letter just received from one of our English correspondents:

"It is not, however, from the 'Metrical Translations from Sanskrit Writers,' or from his five volumes of 'Original Sanskrit Texts,' that one can adequately gather how thorough was his mastery of the sacred language of the Brahmans. Ability to translate Sanskrit is nothing very extraordinary; but to compose in it so as to satisfy the most exacting criticism is an accomplishment with which few Europeans have ever been credited. At the head of these few, and immeasurably superior to all the rest, stood Dr. Muir, in comparison with whose Sanskrit that of Dr. W. H. Mill, and that which is traditionally attributed to Robertus de Nobilibus, is maladroit, cramped, and jejune, not to speak of its being occasionally unidiomatic. Such, in fact, are the Sanskrit verses, numbering many thousands, of Dr. Muir, that experts can easily understand the incredulity as to their being of his authorship, which was manifested by the learned Pandits to whom, before they were consigned to the press, they were submitted, and by whom they were but very seldom indeed found to be susceptible of even the slightest amendment. Christian doctrine forms, for the most part, their subject-matter."

—No. 5 of the 'Memoirs of the Science Department' of the University of Tokio is entitled "Measurements of the Force of Gravity at Tokio, and at the Summit of Fuji-no-yama," by Prof. T. C. Mendenhall. The author was connected with the expedition sent out to Russian Asia, by the United States Government, to observe the transit of Venus in 1876, and though not a pioneer in the work to which he set himself in Japan, since Professors Ayrton and Perry had attempted the same problem, his methods seem to have excelled those of his predecessors in eliminating the possible means of error. He conducted his experiments in the physical laboratory of the college, with fairly good apparatus. Eleven time-determinations were made on two successive days, May 26 and 27; the time of vibration of the pendulum being the mean of two or three independent measurements of the chronograph record made by different persons. Making the necessary corrections and reductions, Professor Mendenhall finds g (=gravity) =7.9784, which is slightly higher than the figure obtained by the use of the generally accepted formula for the calculation of the value of g for any latitude. It will be remembered that the mean of all results thus far obtained by experimenters (Reich, 5.438; Baily, 5.660) is 5.639; that is, that the density of the earth is 5.6 times that of water, or roughly, that the weight of our planet is six sextillions of tons. According to Prof. Mendenhall, the earth-mass would turn the scale at a still higher figure on the cosmic scale-beam. His equally careful second series of experiments was made on the top of Japan's peerless mountain, correctly called Fuji-no-yama, or Fuji-san, but not Fuji-yama. The pilgrims' huts for the nonce were occupied by the observers and with the instruments light and heavy, the Buddhist priest permitting. The mountain is 12,441 feet high, and its angle, assuming the mass to be a perfect cone, 138°. The value, at that height, of $g_2 = 9.7886$ was obtained; or, if the mountain did not exist, the value would be 9.7865. The density of the mountain, as furnished by the mean results of three well-known geologists in Japan, was, $d = 2.12$, and the attraction of the mountain is only .00021 of the attraction of the earth. Using the standard of Baily, however, $d = 2.08$. The result of the two series of experiments, even after allowing for all known sources of error, and calculating even from the accepted standard of Baily, is to show that the mountain is deficient in attraction, a fact which may serve to throw light on the structure of volcanoes, which word describes the history of Fuji-san.

—An uncommonly rich and varied programme was offered to the patrons of the Brooklyn Philharmonic Society on Saturday evening. It opened with Mozart's E flat Symphony (No. 543, Köchel), which, simple as it may seem, offers almost as great difficulties to the players as the most elaborate modern composition. But Mr. Thomas and his musicians were fully equal to their task, and the result was as finished a performance as we have ever listened to. Mrs. Osgood sang with a clear, resonant voice and in good style the exquisite cavatina "Glöcklein im Thale" from "Euryanthe," Weber's

finest and too much neglected opera, which, we notice, is at last to be produced in London, under Hans Richter, in May. The audience was so much pleased with the song and its interpreter that it had to be repeated. In the next number—selections from Mr. Paine's "Œdipus" music—the orchestra was assisted by the Philharmonic chorus and Mr. Toedt. The instrumental parts, including the prelude and postlude, have never been played before with such passionate energy and such a "stereoscopic" display of all the lines and colors of this interesting composition; and if the vocal part was not equal to the instrumental in smoothness, some allowance must be made for the uncommon difficulty of the work. The overture and a scene from another neglected opera, Schumann's "Genoveva," followed. In listening to such music as was here rendered from "Euryanthe" and "Genoveva" many probably wondered that these operas are not more popular. The fault in both cases lies in the undramatic subject; in Schumann's case, also in a want of dramatic definiteness in the music. Mr. Henschel showed in the "Genoveva" music that he possesses a powerful and agreeable voice, and that he understands the art of phrasing. In the Sanctus from Beethoven's Missa Solennis in D major, which followed, he was ably assisted by Mrs. Osgood, Miss Winant, and Mr. Toedt; while in both this and in the last piece—the "Glory be to the Father," from Handel's Utrecht Jubilate—the chorus and orchestra combined in a performance of great impressiveness. The concert received additional interest from the presence of Professor Paine, who had been the guest of Mr. Thomas for several days.

—When Johann Strauss, after a long career as waltz and polka composer, some years ago suddenly abandoned this field of activity and began to write for the stage, his friends and admirers had some reason to anticipate an unsatisfactory result. Operetta composers of merit already existed in sufficient number, and it seemed doubtful whether Strauss could compete with these specialists in their own department. Besides, there was no one competent to take the place of Strauss and supply the world with new and piquant dances for every year's carnival season. Strauss, however, soon dispelled all these doubts. His early works, "Indigo" and the "Carnival," by which he got his training for the stage, were rather weak and of transient value, but in his later works, in "Fledermaus," "Spitzentuch," and finally in the "Merry War," he raised himself to the front rank of operetta composers. And, best of all, while supplying Germany with a new operetta every year, he did not fail to provide the usual number of new waltzes, polkas, and quadrilles. These he simply took out of his stage works, in which, as was to be expected, they formed the principal attraction. Thus it came to pass that residents of Vienna who were not so fortunate as to secure a ticket for the first night of a Strauss operetta were enabled to hear the best tunes in it a day or two later in their beer-gardens, ballrooms, and very shortly even in their backyards during the daily visits of the irrepressible organ grinder. His latest work, "The Merry War," was produced in Vienna early in the winter, and had some weeks ago already got beyond its sixtieth performance. It has also been produced in a score of other German and Hungarian cities, always with equal success. Vienna excepted, we doubt if in any city a performance of more uniform merit has been given than was witnessed on the 15th inst. at the Thalia Theatre. In the first place the scenery was so attractive, especially in the first act, where the background is taken up with a large semi-real waterfall and a mountain to the right, that it received a special salvo of applause when the curtain first rose. The number of persons on the stage was unusually large and gayly costumed, and the chorus proper, precise, and in perfect tune. The orchestra, including on this occasion a harp, was well trained and as effective as its size permitted it to be. To give Strauss's music its full significance and force it would have to be much larger, for Strauss has in his own department no rival in the art of instrumentation, as all can attest who have heard his waltzes played by Mr. Thomas's full orchestra. Much clever and laughable work was done by Frl. Jules, as commander of an army of female warriors; Herr Link, as a silly nobleman who is always letting out everybody's secrets; Herr Adolfi, a Dutch dealer in tulip bulbs, whose whole stock in trade has been consumed by a band of soldiers; his wife, Frl. Seebold, who did the best singing of the evening; Herr Klein, Frl. Schamidatus, Frl. Stubel, and others.

—The libretto, by Zell and Genée, while above the average in construction and dialogue, is too complicated in action to be summarized. Suffice it to state that the war which Strauss has set to music is called merry because it is waged between two Italian principalities for the sake of a ballet-dancer who has been engaged to dance at the same time for both parties, neither of which is willing to yield. In character the play is not comedy, but pure farce, leaving much to the by-play of the actors. Strauss's music, however, is of a much nobler character, being as far removed from the grotesque buffoonery of Offenbach as from the inanity of most operettas of the day. There are several uninteresting numbers, especially in the first and third acts; but in the first and second acts there are not only dances, but purely lyric pieces of great piquancy and novelty. Dr. Hanslick commends the "Merry War" for the absence of those pompous ensembles, *à la* Meyerbeer and Verdi, which Suppe, Milloecker, and others always introduce in their works. But it seems to us that the finales of all three acts of the "Merry War" are sufficiently complicated and overwhelming to appear in any grand opera; and they are besides characterized by great beauty and good taste. Instead of picking out and describing the best numbers in detail, we advise all, Americans and Germans, to go and pick them out for themselves. As there is not much dialogue, and the plot is explained in English on the programme, a knowledge of German is not essential to the enjoyment of the music, which bears repeated hearing. Indeed, we were surprised to find that, in spite of abundant applause and enthusiasm, some of the best numbers were not as fully appreciated at a first hearing as they deserved to be. If Strauss should come to America this summer, we trust the managers of the Thalia will secure his services for a few gala performances of his best operettas.

THE VOYAGE OF THE VEGA.

The Voyage of the Vega. By A. E. Nordenskiöld. London and New York: Macmillan. 1882. 8vo, pp. 756. Portraits, maps, and cuts.

THE essential facts of this memorable voyage have become familiar to every one through the newspapers. No voyage of modern date has excited an interest more widely spread among all classes in both hemispheres. The "circumnavigation of Europe and Asia" is an idea easily grasped, appealing powerfully to the imagination, and, in its final accomplishment, arousing admiration more than proportional to the scepticism previously generated by more than three centuries of failure. It will therefore suffice, for our purpose, to say that the *Vega* sailed from Gothenburg in Sweden on the 4th of July, 1878, was frozen in on the coast of Siberia on September 28th, wintered, was released on the 18th of July, 1879, and reached Stockholm *via* the Suez Canal on the 24th of April of the following year, without serious injury to the vessel or to the health of any of her crew. The homeward voyage from Japan was almost a triumphal progress—festivities, testimonials, and medals following one another almost to weariness at each succeeding port.

Apart from its incidents, it will be of interest to compare the voyage with Arctic expeditions in general, and profit by the lesson, if any, to be drawn from such comparison. There is no doubt that to the general public Arctic voyages are becoming wearisome. This results partly from the fact that the Arctic regions have been written about to satiety, and it is almost impossible to bring forward anything on the subject new to the reader, except geographical details which naturally have a strong family likeness among themselves. Admiration of "pure grit," which has long been the real support of Arctic adventure, palls, in time, when this quality appears to be exhibited uselessly while there are other channels open by which it might be made of use to mankind. It seems to us that the popular weariness is justified in the case of many Arctic expeditions with which we are familiar. The only sound ground upon which the public may properly be taxed for such voyages is that of the advancement of scientific research. That such work in the Arctic is absolutely required for the promotion of certain important branches of investigation is true. That such studies can be served by haphazard collections of inexperienced, enthusiastic, untrained, unscientific young gentlemen from the public service or private life, assembled in a more or less imperfect and imperfectly equipped vessel, and loaded with instruments of which they are incompetent to make thoroughly good use, is not true, and the public are perfectly justified in their expressions of distaste for such methods of proceeding. It is true, again, that inexperienced and untrained men have made praiseworthy contributions to knowledge, but it has been at a wholly unreasonable expenditure of life, strength, and means. It has been using bad tools where the best were needed and, in most cases, might have been obtained.

In refreshing contrast to this was the method adopted in the expedition of the *Vega*. The qualifications of the commander need no explanation; by years of training, research, and experience he has made himself the most competent living man for such a trust. His assistants, most of whom had had previous experience under his own eye in Arctic work, were all men of thorough education and competence for their respective duties. The vessel was chosen from among those built by hard-headed, common-sense business men for navigation in the ice, and, though of but moderate steam power, was adapted for her work to an uncommon degree. A better vessel might doubtless have been built, but the element of economy necessarily entered into the considerations involved. The party as well as its chief knew what was wanted to be done, and were prepared to do it, instead of having everything to learn and nobody to teach them.

The story of the voyage could have been told in a chapter or two. The scientific results, by intention or necessity, are largely reserved for treatment in another form,* though glimpses of their nature and pregnant hints appear here and there in the text. The work is thus largely devoted to a review of the progress of discovery in Siberia and along its Arctic border, of which the voyage of the *Vega* was the crowning

*"The Scientific Results of the *Vega* Expedition (Stockholm: Academy of Sciences), of which some 500 pages have appeared.

achievement. This review is very thorough, though it would seem as if some quite modern travels, such as those of Bush, Kennan, and various Russian officers, were at least as well worthy of mention as some of the completely unfruitful boat journeys of the early Promishleniks. A full and interesting account is given of the Samoyeds and other dwellers on the shores of the polar sea. This population appears to be considerably less numerous than formerly, having largely migrated southward into the more fertile and hospitable regions of Siberia since Russian rule ended internecine difficulties, and promoted more varied means of obtaining a livelihood. The Arctic bird and mammal fauna is well described, many lists of plants appear, and some of the invertebrates are very beautifully illustrated. The habits of the Tsauchu, commonly miscalled Chukchis, near the wintering-place of the *Vega*, are pretty fully illustrated and described. It is certain, however, that a wider experience would have somewhat modified the impressions produced on the *Vega* party by their intercourse with these people in this limited and relatively somewhat peculiar locality. A knowledge of the seasonal migrations of certain seals and the walrus about Bering Strait would have enabled a better estimate to be arrived at in relation to the fauna of the wintering-place. The abundant Kamtchatka wild sheep of the Chukchi peninsula go unnoticed.

Valuable observations on the character of the sea ice, and confirmation of the previously-announced opinion that the plains of Siberia and a part of eastern America thereto adjacent have not been subjected to glaciation, are recorded and discussed. The presence of fiords on the Chukchi peninsula is taken as possibly indicating a local glaciation there, and extremely important data as to the nature and manner of formation of the ground ice are presented to the reader. The work closes with an account of the voyage homeward, some interesting notes on Japan, an acknowledgment of the testimonials heaped upon the honored travellers, and thanks from the chief to the members of his party for their faithful coöperation, which alone made success possible. Marked by freedom from dogmatism, an evident desire to do full justice to his collaborateurs, an absence of controversy and self-appreciation, the work is what we might reasonably have expected from its author, having a previous knowledge of his acquirements as a scientist, and of that dry humor and charming sociability which distinguish him as a man.

It is now in order to consider in what manner this important work has been presented to the public in an English dress. The translation is by Mr Alexander Leslie, who, as well here as in the 'Life and Voyages' of Nordenskiöld, published in 1879, gives overwhelming evidence of his unacquaintance with the English language and his incompetency for the task he has undertaken. He testifies in a "translator's preface" to the services of two ladies who read proof for him, but it is not apparent that the proofs were read at all. Not only are typographical errors, recognizable as such, by no means rare, but the Swedish idioms have been reproduced with a literalness which is both ridiculous and annoying. Many words are taken over without translation—*e. g.*, "evertebrates," for invertebrates; "leister," for fish-spear. Many are literally translated, and thus no longer make sense; as, "blinding white," for shining; "our loose earthy layers," for alluvial strata; a "reddish yellow," for a reddish *yelk* (of an egg); "self-colored," for uniformly colored; "self-dead," not for suicides, but animals which have died a natural death. "At sight of a whale all men were out of themselves with joy." "Sound" constantly appears for strait. Egregious errors are introduced by translating a word meaning *shell-fish* as "crustacea," whereby the plate (p. 286) is denominated "Fossil crustacea of the tundra," when it does not contain a single figure of a crustacean (the same error is frequently found in the text, and "mollusk" is repeatedly and wrongly used as synonymous with *invertebrate*). "Find" is used as an equivalent for "discovery," and is for some occult reason italicized. The list of similar blunders might be almost indefinitely extended.

Another gross blemish is the want of uniformity in writing proper names. Those of persons are misspelled to a disagreeable extent. Thus we have Morton, Wrangel, Küber, Clarke, Eschscholz, Kellet, Maynod, for Martin, Wrangell, Kyber, Clerke, Eschscholtz, Kellett, and Maynard, and many more such. The names of places, in the variety and stupidity of their transliteration, beggar description. Their phonetic value does not appear to have been considered at all. The Russian word for land is reproduced in three different ways on one page; the "j" is used, with utter recklessness and no uniformity, for the value of "i" throughout. Thus we have Semlja in one case, Zemlya in another (why not Sjberja in a third?); Svjatojnos, Sviatojnos, and Swjatoinoss for Sviatoi-noss; Yenisej (why not Jenjsej?) for Yenisei, Chutskojnos for Tchukotskoi-noss, Tajmur for Taimyr, etc. Sometimes *v*, sometimes *w*, appears for the Russian *b* in allied or identical words. The word Chukchi, a bastard at best as an adjective, is deprived of its final vowel and made unpronounceable throughout a great part of the book. Distances are not reduced to any uniform or English standard, but appear in kilometres, Swedish miles (6.64 English miles), German miles, and geographical miles (these last often called "minutes" without any explanation); depths are in metres, not fathoms; heights in metres; small areas sometimes in square fathoms, sometimes in centimetres.

Were a classical work so bungled, the translator and publishers would be overwhelmed with derision, and much the same treatment is deserved in the present case. The illustrations are numerous and good, but badly printed, and with the Swedish references in some cases left unchanged; or, if changed, not done with accuracy. Lastly, the binding is poor, though the cover is in excellent taste and prettily designed.

ELTON'S ORIGINS OF ENGLISH HISTORY.

Origins of English History. By Charles Elton, sometime Fellow of Queen's College, Oxford, and of Lincoln's Inn, Barrister-at-Law; author of 'The Tenures of Kent,' etc. London: Bernard Quaritch. 1882. 8vo, pp. 458.

Mr. Elton's 'Origins of English History' is "the result of an attempt to rearrange in a convenient form what is known of the history of this country from those obscure ages which preceded the Roman invasion to the time when the English accepted the Christian religion and the civilizing influences of the Church." The last chapter treats of "the English conquest"; all the rest of the book is devoted to the period, generally left for the most part out of view by historians of England, when there were no people in the island who called themselves English. The first three chapters treat of Pytheas and other travellers and geographers of classical antiquity; chapters iv. to x. are devoted to the Celtic and non-Celtic tribes that occupied Britain before the Angles and Saxons; chapter xi., to the Roman occupation; chapter xii., to the English conquest.

To one holding Mr. Freeman's opinion, that the native population were, to all intents and purposes, exterminated by the English invasion, all this can hardly appear a part of the origins of English history, but at best a matter of antiquarian interest, touching those who occupied the island before the present race. Mr. Elton, however, is of those who believe that the English people, no less than the French—although no doubt in a less degree—are composed of a number of successive strata, as we may call them. A large part of the volume is devoted to the tribes who preceded the invaders of the fifth and sixth centuries, and, as he thinks, have left their traces in the population and the institutions, no less than in archæological remains; who, therefore, no less than the Angles and Saxons, form a constituent part of the "English" nation. Mr. Elton counts more of these strata than are usually recognized, and a considerable part of his work is devoted to substantiating his view, that there were two distinct races between the palæolithic age, of which really nothing is known, and the Celts. These two races were the neolithic tribes—dark, slight, and with long heads, "who built their long barrows and polished their weapons of stone"—and the men of the bronze age, tall and fair, with "round skulls, who were buried in round tombs and had learned to work in metal." These two races appear to be clearly made out; but here Mr. Elton takes issue with Mr. Skene, who, as cited upon page 158, considers the round-headed men to have been Celts, while Mr. Elton (p. 160) regards the Celts, as well as the Anglo-Saxons, as dolichocephalous.

The bronze-age invaders, who suddenly appear intermingled with the earlier neolithic inhabitants, were, he says (p. 144),

"tall men of the fair Finnish type that still prevails so largely among the modern inhabitants of Denmark and in the Wendish and Slavonian countries. They differed remarkably from the straight-faced, oval-headed men who are identified with the Celts, the Germans of pure blood, and the 'Anglo-Saxons' of our early history. They were large-limbed and stout, the women being tall and strong in proportion, as in a community where life was easy and food cheap. The men seem to have been rough-featured, with large jaws and prominent chins, and skulls of a short, round shape, with the forehead in many cases retreating rapidly, as if there were need of an occipital balance to carry off the heaviness of the large lower jaw."

These "strange and wild communities," Mr. Elton thinks (p. 170), afterward "became merged or included in the Pictish nation; and it may be hoped that something more will be learned about them when the Pictish sculptures are interpreted." Meantime, of the little that is known about the Picts, there is one fact (p. 174) that appears to point to a non-Aryan character. This is the custom of inheritance in the female line: the royal dignity "never went from father to son; but when the King died the crown went to his next brother, or, in default, to his sister's son, or in any event to the nearest male relation claiming through a female, and on the female side." This is a custom familiar enough in primitive nations, but only found in a few obscure instances among Aryan nations. "There is an abundance of positive evidence," continues Mr. Elton, "that the Aryan nations had established the 'agnatic system,' by which the family was confined to males and unmarried women descended from a patriarchal ancestor, even before the divisions which brought the Celts into Europe." This is perhaps stated too strongly (see Mr. Yonge's 'Essay on Anglo-Saxon Family Law,' p. 149); but at any rate the *family*, if not the agnatic family, does appear to have been a characteristic institution of the Aryan peoples. Mr. Elton's suggestion, that the exceptions to this (as among the Spartans) are instances of the survival of the customs of an older people, is worthy of consideration.

To the same cause, the persistence of pre-Aryan institutions, Mr. Elton traces, among other things, the curious custom of "Borough-English" or "Junior-Right," by which the inheritance passed to the youngest instead of the eldest son or daughter. This custom he finds, intermingled with gavelkind or primogeniture, in various parts of England, but nowhere in Ireland or Scotland; in various parts of Germany, but nowhere on the Scandinavian mainland; extensively in Eastern Europe, and in some other parts of the world. This, too, appears to be irreconcilable with the established doctrine in regard to the Aryan race—that of a primogeniture wholly different in origin from feudal primogeniture: the custom "which connected the eldest son with the duty of guarding the hearth and performing the family rites" (p. 210). (We will notice here, by the way, a very useful collection of the facts which testify to the worship of the hearth among Celtic and Slavic peoples.) This custom, therefore, at variance with the Aryan institutions with which it is surrounded, he ascribes to a survival of pre-Aryan usages. Whether Mr. Elton's theory that the round-headed race were non-Aryans be accepted or not, there can be no doubt that he has done good service by emphasizing so strongly the pre-Aryan elements in the population of England, and that the suggestion of a survival of their customs furnishes a useful hypothesis to explain the apparent inconsistency that exists between the strongly-marked Aryan institutions, built upon the family, and the singular customs that are found here and there among nations that pass as Aryan. The weakest point in the theory of ancient society worked out by the late Mr. Morgan is the assumption that the Greeks and Romans, the Germans and Slavs, went through all the phases of progress found among the Iroquois and the Mexicans.

We have given at this length Mr. Elton's theory about the intermediate race—tall, fair, brachycephalous—because it is really the most significant part of his book, and because upon it he takes distinct issue with so high an authority as Mr. Skene. As to the Celts themselves, who followed this bronze-age people, he presents a view different from that generally accepted. We are accustomed, on the assumption that the Irish and Welsh languages were as far apart as possible, to consider these as representing respectively the two branches of the Celtic race (Gaelic and Cymric), and to connect the Celts of Gaul with the Welsh of Britain rather than with the Gaels of Ireland. Mr. Elton shows, from the investigations of Professor Rhys, that the evidence of language has been misinterpreted: that in the early centuries (the fifth and sixth after Christ) "the Welsh and Irish languages resembled each other in the very points on which they afterward differed" (p. 101). Consistently with this view, instead of treating the Welsh and Irish as independent branches of the Celtic race, he treats "the Britons of the Interior" as a whole, in chap. ix., distinguishing them merely from "the Gauls in Britain" (chap. v.)—that is, the immigrants from Gaul, including the Cantii, the Trinobantes, the Iceni, the Catuvellaunian confederacy, etc., the occupants of southeastern Britain. The customs and institutions of each of these groups, with their state of civilization, are carefully described.

One of the best bits of work in the volume is the reconstruction, as we may almost call it, of the voyage of Pytheas, in the two opening chapters. All the fragments that mention this voyage are collected and compared, and a high degree of value and authority is vindicated—and it would seem established—for this pioneer explorer. His voyage, we are told (p. 15), was "from Cadiz around Spain to Brittany, from Brittany to Kent and several other parts of Britain, from the Thames to the Rhine, round Jutland along the Baltic to the Vistula (which was mistaken for the Tanais); thence out of the Baltic and up the Norwegian coast to the Arctic circle; thence to the Shetlands and the north of Scotland, and afterward to Brittany again; and so to the mouth of the Garonne, where he found a route leading to Marseilles." He "did not visit Ireland or the western coast of Britain." The results of these discoveries are seen in "the extent and accuracy of the knowledge which the earliest classical writers possessed concerning the north of Europe, as compared with the comparative ignorance and confusion of later times." If the whole book will be welcome to historical students, these chapters will be of great service in the study of classical philology. The two closing chapters, upon the Roman occupation and the English conquest, do not need any special notice, except to remark that they contain an admirable summary of the history of Britain during the first six centuries of the Christian era.

If we were disposed to point out any defect in the workmanship of this book, it would be that the author is not always clear and precise in the statement of his problems. In chap. vi., for example, a brief sketch at the outset of the conditions of the inquiry—exactly what is known and established as to the prehistoric tribes, and the substance of the leading theories—would have been very acceptable. We on this side of the Atlantic, at any rate, are not so familiar with the long and the round barrows, the dolichocephalic and brachycephalic remains, the dolmens and the cromlechs, as not to find some obscurity at first. The book is a remarkably handsome one, and is provided with copies of ten ancient maps, mostly from the Latin Ptolemy of 1478 and that of 1525.

HUNGARY.

"*Magyarland*": Being the Narrative of Our Travels through the Highlands and Lowlands of Hungary. By a Fellow of the Carpathian Society, author of 'The Indian Alps.' 2 vols. London. Boston: Houghton, Mifflin & Co. 1882.

"Our travels" are the travels of British ladies, and our "fellow" is one of them. She is a good sketcher with pen and pencil, and her descriptions of the Hungarian mountains and plains, of Magyars, Slovaks, Ruthenians, and other dwellers in the polyglot land encircled by the Carpathians, will afford much amusement and a little correct information to her readers. It is not her first journey to that romantic country. She opens her narrative with visions of Buda-Pesth which reappear before her fancy. "The porphyry hills of Buda stand out blue against the sky. . . . What stirring memories come crowding into the mind! What changes have come over this ancient city of kings since imperial Rome sat proudly enthroned within its confines, and in her days of power erected this [which?] amphitheatre, enduring type of her greatness and her brutality! How varied and mighty have been thy fortunes, proud Secambria, since thy proconsuls celebrated in this arena their cruel fêtes!" Which we must prosaically explain by adding that Old-Buda, a place adjoining the Buda of these visions, stands on the site of ancient Aquincum, a Roman town where emperors *might have* sat enthroned, and proconsuls *might have* celebrated fêtes, and that mediæval chroniclers talk of Sicambria, a royal seat of Attila on the Danube, which critical history rejects as a fiction. And then "we hear the triumphal strains of martial music that proclaim the overthrow of Rome and the erection of Attila's iron throne," and see "Árpád and his chieftains from the North, who celebrate in their turn, on the ruins of Attila's palaces, with the music of lyres and the clash of cymbals, the Magyar's conquest of Pannonia." All these appear to us—in a romantic dream—crowding out Charles Robert, Louis the Great, and Matthias Corvinus, who did sit enthroned in Buda. "Truly, a wondrous history!"

It was a lovely May morning on which our travellers started. In Paris they lingered for a day to call on a Hungarian merchant. He was absent, but a Frenchman volunteered advice as to the route. He could not refrain, however, from muttering: "Que les Anglais sont originals (*sic*)!" They ought to be satisfied with visiting Pesth. "Vous avez raisong, mussoo," said an American who was present. "Natur' made Hungary a first-class country, but they've got a mode of locomotion there that whips all creation. As to railways, they've none to speak of; and when you do find 'em, the pace at which the lumbering old machines crawl along is a caution even to snails. If you want to do the Danube," etc. This great familiarity of our authoress with typical Gallicism and Americanism may serve as an earnest of her accuracy in depicting Magyar things. In Venice she learned from a railroad *inspettore* that to the Hungarian frontier she had to go through Cormöns (*sic*), and that Italians "do not often travel, and to Hungary never," the climate of Hungary being "una (*sic*) clima da Diavolo." The necessary provisions for the inner man were procured; "for the necessities of the outer man" the travellers "were already well provided by the possession of a large bunda, a relic of former travels. This magnificent garment of Hungarian invention is a glorious institution," being grandly adapted to the climate of the country, where, as we are told to our amazement, "the chill which immediately follows the setting of the sun often causes the temperature to sink 20° Réaumur in the short space of two hours." (Hear, hear!) It is of Hungary, and not of the desert of Sahara, we are reading. And strange like the climate is also the great plain of Hungary, of which we have the following, not altogether fanciful, description:

"The majestic Alföld, or plains of Hungary—the European Pampas, as they have been called—though hardly as boundless as the Ocean, are scarcely less fickle: now soft and tender, under a calm and cloudless sky, as they slumber in the dreamy haze of sunny noontide, now all glorious in the resplendent hues of the out-goings and incomings of Day; anon fierce and tumultuous, as a violent wind sweeps over them, which, meeting with no obstacle whereon to spend its fury, whirls shrieking in frantic circles like an angry demon, tosses the trembling and resistless hillocks of sand into billows, or, with a hissing noise, lashes them into fragments like ocean spray. Here also in summer, as on the great African desert, the traveller crossing the sandy wastes is often misled by the delusive mirage. In the distance a lake or village or lonely *csárda* (tavern) lures him on and causes him to lose his way. . . . Who can describe the awful grandeur and stillness that reigns over this boundless region as Night comes hastening on, bringing with it the stars, to hang like silver lamps in the sapphire deeps?" etc.

Our authoress reaches the extreme southwestern corner of Hungary, and, glowing with poetic imagination, believes she has "now reached the threshold of the great plains," although the whole of the hilly and wooded Trans-Danubian Circle, a main division of the country, is still between her and those plains, not to speak of the real Alföld, which is in the eastern half of the kingdom. "The vast prairies we have now entered"—in fanciful thought—have ever been considered, we are told, "the Eldorado of brigands, who until recently—that is to say, until ten or twenty years ago—kept the otherwise peaceful dwellers of the plains in a perpetual

state of terror and alarm. . . . Amongst these brigands of modern time were men of education and family; not only this, it has even been darkly hinted that magnates who at one time held responsible positions under Government have been more than suspected of joining these marauders for the purpose of recruiting their enfeebled finances." More startling still, and evidently more "darkly hinted," is "the fact of there having been no fewer than twelve hundred of these robber-criminals imprisoned at the same time within the walls of the fortress of Szegedin, the capital of the Alföld." (We used to believe that Debreczin was the capital.) In explanation of this extraordinary state of things, we hear that the Turks held the greater part of the country in possession "until a comparatively recent date"—that is, strictly speaking, until two hundred years ago; that "the Magyars are radicals in all political and national affairs"—which makes us wonder how the Deák and Moderate Liberal parties have managed to control Hungarian politics from the restoration of the constitutional régime in 1867 to this day: that ——. But we have no more time for this book; we leave and recommend it to those who relish a modicum of true information mixed up with a goodly measure of fanciful and lively talk. We must, however, still protest against the profuse admixture of Magyar and Slavic words, half of which are incorrectly printed. Thus, to cite a few examples, we find on page 104, vol. i., "József" (three times) for *József*, "britzska" for *bricska*, and "Féjévar" for *Fejérvár;* on page 106, "Muska" for *muszka*, "Ángolok" for *angolok*, "Ió" for *Jó*, and again "Féjévar," followed by the same thrice-wrong word on the following page; on page 110, again three times, "József"; and on page 116, "Varósmarty" for *Vörösmarty*, the name of "the Schiller of Hungary."

Chancellorsville and Gettysburg. By Abner Doubleday, Brevet Major-General U. S. A. (Campaigns of the Civil War. Vol. VI.) New York: Charles Scribner's Sons. 1882.

In commenting upon the preceding volumes of this series we have endeavored to call attention to the unbiassed and unpartisan spirit in which they have been written, to the manner in which preconceived opinions have been laid aside in the endeavor to form an accurate and impartial historical judgment, and to the fact that the authors have made a careful study of all materials, published or unpublished, in the possession of the War Department; have used this material in proper proportions, have given full weight to conflicting testimony, and have named their authority for every statement that was likely to be disputed. This historical spirit has permeated each one of the preceding military narratives; and though many people may refuse to accept their conclusions, every one must acknowledge that they have been reached by fair-minded and patient investigation. This uniformity is now sharply broken by a book which is conspicuous for the absence of every one of the good qualities above referred to. The historical spirit is entirely lacking, startling statements are constantly made without any authority being given for them, questions of numbers engaged and losses incurred are quoted at second hand, minor details are dwelt upon at length, while great facts are hastily passed over, and there is a vein of personal animosity running through the book which throws discredit upon everything in it.

The campaign of Chancellorsville—most brilliantly begun, most pitifully ended—was lost primarily by Hooker's inefficiency, and secondarily by Howard's neglect to take proper precautions on his right flank. We think that there is hardly any question at this day of the relative importance of the faults committed by these two officers. Even for Howard's neglect Hooker is himself in some measure responsible, for although he sent Howard a positive order at 9:30 A. M., saying that there was reason to suppose the enemy was moving toward his right, and directing him to be prepared for an attack in that quarter, yet, at 4:10 P. M., he sent a despatch to Sedgwick, saying that the enemy was flying, trying to save his trains. By this despatch Hooker showed that he had modified his opinions of the morning, and did not consider an attack upon Howard as probable. Had he still anticipated an attack on his right, it would have been his duty to reiterate his orders to Howard. Nothing, however, can relieve Howard from the responsibility for his inaction in this matter, which amounted to disobedience of orders of a very serious character. But the injustice done by this book consists in bringing Howard's action into such prominence as to make it appear that the whole battle was lost by him. So far is this from being the case that, even considering the Eleventh Corps as completely destroyed and non-existent, Hooker had still nine men to five of Lee; and both before and after the rout of this corps Hooker committed such mistakes, and was so feeble and irresolute, that his defeat was certain against such antagonists as Lee and Jackson.

If the battle was lost by any one single mistake, it was already lost on the 1st of May, when Hooker, after meeting but trifling opposition, voluntarily withdrew from the open ground toward Tabernacle Church into the dense thickets of the Wilderness. The disaster was increased by Hooker's ridiculous order to Sedgwick, by the manner in which he allowed himself to be driven back by an inferior force on the 3d of May, and by his utter inaction on the 4th of May during the severe attack upon Sedgwick. In short, Hooker was fairly beaten by the superior skill and boldness of his antagonist, and his responsibility for the defeat was clearly and sharply defined. This book endeavors to divide the responsibility and throw the greater part of it upon a subordinate general, against whom, as is evident throughout, the author has strong feelings of personal resentment.

The battle of Gettysburg is described in the same personal vein, deficient in dignity as well as in accuracy and impartiality. From beginning to end Meade is nowhere commended, and the criticisms passed upon him are not those just criticisms which can be made upon any commanding general, but are mere sneers. At one point they pass beyond all bounds in asserting that "there can be no question" that Meade desired to retreat on the night of July 2d, but was restrained by his corps commanders, when, in fact, Meade testified under oath, in the most explicit language, that he had no such intention, and all the principal generals, except Butterfield, testified to the same effect. The animus against Meade is so marked that it becomes necessary to point out—what otherwise would be unjust—that General Doubleday, having been temporarily in command of the First Corps, was relieved on the night of July 1st by a junior officer, and that on July 7th he left the army, and passed his time during the remainder of the war as a member of courts-martial and military commissions. In his testimony before the Committee on the Conduct of the War, he ascribed his relief to the following cause: "No man who is an anti-slavery man or an anti-McClellan man can expect decent treatment in that army as at present constituted." That was his opinion in March, 1864, and there is no reason to believe it has changed. He now believes it to be his duty "to give to posterity the benefit of his personal recollections." Such recollections are very interesting, but they are in no sense history; and the whole tenor of this book is so essentially different from that of the series in which it is placed, and there are so many other good accounts of the battle of Gettysburg, that we hardly think it necessary to follow these personal recollections in detail.

Transactions of the Cambridge Philological Society. Vol. I., from 1872–1880. Edited by J. P. Postgate, M.A., Honorary Secretary. London: Trübner. 1881.

The Society whose Transactions are here recorded has existed only eight years. It started into life under the auspices of two of the most eminent members of the University of Cambridge, Prof. Cowell and Mr. R. C. Jebb. The first list of the Council of the Society includes most of those whose names have obtained recognition out of England—Munro, Skeat, Paley, J. E. B. Mayor—each of whom has contributed something to the present volume. As Oxford has not at present taken the same course, and has indeed only recently begun to print a yearly abstract of the proceedings of its own Society, a unique interest attaches to this first collective record of the philological activity of the sister university. The *Journal of Philology*, the only recognized English organ in this department, is also published by Cambridge; and were it not for the newly-started *Anecdota Oxoniensia*, a really enlightened undertaking inaugurated by Max Müller and other ardent supporters of research, the world at large might imagine that somnolence had overtaken the older university, or at least that it was contented with illuminating its own members.

The volume before us is, as might be expected, mainly occupied with discussions of difficulties in classical authors—notes, in fact, on particular passages from the works most recognized in the classical tripos. As this extends over a very wide field, the papers are of course highly multifarious, including not only such well-known works as the Homeric poems, the Tragics, Thucydides, Cicero, Catullus, Virgil, Horace, etc., but also those less widely studied—Pindar, Hesiod, Theophrastus, the Greek orators, Lucilius, Tibullus, Propertius, etc. Aristotle has an able exponent in Mr. H. Jackson, who has also, in conjunction with Mr. Paley, contributed to one of the rare discussions we have been able to find in these 420 pages on Plato. Prof. Mayor's papers are on the whole the best part of the book. They fall into two heads, (1) lexicographical, (2) antiquarian. Under the first head special attention may be called to the remarks on the last two editions of Forcellini's 'Lexicon' (De Vit, Corradini), and on the American Latin Dictionary of Lewis and Short, which Prof. Mayor (probably the greatest living authority on the subject) pronounces to be more copious and trustworthy than any of the same bulk that has yet appeared in any language. To the second head belong the papers tracing the origin and growth of the expressions "poetical licence," "to save appearances," "in puris naturalibus," "hemina sanguinis." Mr. Munro contributes an ingenious paper on a well-known passage of Lucilius, and another on the era of that author, who, since the publication of L. Müller's important edition, has begun to be better known and more studied. To complete this triad of eminent philologers, there are two or three papers by the late Richard Shilleto—on Greek compounds with ἀ- and δυσ-; on συνασοφεῖν and ἀσοφία; on Greek deponents with aorist in -θην—all of which will be found fully up to the level of that great scholar at his best.

Among the contributions of less notable men may be mentioned two articles by Hermann

Hagen on Greek army doctors and on the treatment of the bodies of criminals at Athens; Mr. Pearson's note on Σείριος ἀστήρ in Hes. op. 415, and several short papers by Mr. Ridgway. Mr. A. W. Verrall's contributions are characterized by a perverted ingenuity which not only fails to produce conviction, but produces a strong reaction to plain sense; they show, however, considerable reading and a great deal of vigor. Mr. Postgate, the Society's secretary and editor, has some interesting remarks on Propertius, and has added to the volume a good résumé of Propertian criticism in 1880. Dr. Hayman, of St. John's College, Oxford, has the singular fortune of having two lengthy and somewhat tiresome papers, "On the Connection between the Legends of Greek Tragedy and Heroic Myth," and "Remarks on Prof. Paley's 'Post-Epic or Imitative Words in Homer,'" printed *in extenso*—a compliment which they hardly deserve from the intrinsic merits of their style or matter. There are a few articles on inscriptions, and one or two on MSS. hitherto uncollated. Mr. Skeat and Mr. Magnusson represent non-classical philology. Finally, as a sort of appendix, are added five reviews of what was written in 1880 on Homer, Plato, Aristotle, Propertius (mentioned above), and Servius. The last is by Prof. H. Nettleship, of Oxford, and is, though short, one of the most considerable articles in the volume. It is much to be hoped that this able scholar will do for the Philological Society of his university what Mr. Postgate has done for Cambridge.

BOOKS OF THE WEEK.

A Tallahassee Girl. [Round-Robin Series.] Boston: J. R. Osgood & Co.
Adams, C. K. A Manual of Historical Literature. New York: Harper & Brothers.
Alexander, Mrs. The Freres: a Novel. New York: Henry Holt & Co. $1.

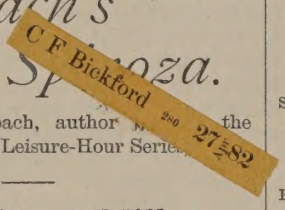
Journal of Social Science, No. xv. Saratoga Papers of 1881. Part 2. New York: G. P. Putnam's Sons. $1.
Memories of Old Friends: Being Extracts from the Journals and Letters of Caroline Fox, 1835-1871. Harper's Franklin Square Library. 20 cents.

HENRY HOLT & CO.

WILL PUBLISH SATURDAY:

Auerbach's Spinoza.



By Berthold Auerbach, author of 'On the Heights.' 16mo (Leisure-Hour Series).

John Stuart Mill.

A Criticism. With Personal Recollections. By Alexander Bain, Emeritus Professor of Logic, University of Aberdeen. 12mo, $1.

James Mill.

A Biography. By Alexander Bain, Emeritus Professor of Logic, University of Aberdeen. 12mo, $2.

MRS. ALEXANDER'S NEW NOVEL,

The Freres.

16mo (Leisure-Hour Series), $1.

NOW READY.

Narratives of State Trials

IN THE NINETEENTH CENTURY.

First Period. From the Union with Ireland to the Death of George IV. 1801-1830. By G. Lathom Browne, of the Middle Temple, Barrister-at-Law. In 2 vols. crown 8vo, $5.

These volumes present in popular form the incidents of such of the State Trials during the first thirty years of this century as appear most clearly to exhibit the political and social phases of that period, and as offer "rich storehouses of curious and authentic facts illustrative of human character and conduct." Among the trials described are those of Governor Wall (of Goree), Robert Emmet, Viscount Melville, the Duke of York, and Mary Ann Clarke, Cobbett, Leigh Hunt, and Drakard, Bellingham, the Nottingham, and Manchester Rioters, and Queen Caroline.

The Nation.

NEW YORK, THURSDAY, MARCH 30, 1882.

The Week.

THERE was no gold exported during the week, and at the close foreign exchange, while near to the specie-shipping point, did not warrant exports. The New York banks gained $184,000 in their surplus reserve during the week, which, considering the usual drain of money to the New England and Middle States to facilitate April settlements, was better than was expected. The Treasury on the 1st of April will begin paying out about $7,500,000 for interest, and, on the 8th, $20,000,000 for 3½ per cent. bonds included in the 108th call; these sums may be prepaid, but orders to that effect have not yet been issued. The New York money market has been easier, and rates lower, than at this season for many years; and in every European money centre the tendency is to lower rates for money, the Bank of England having during the week reduced its posted discount rate to 3 per cent., and the Bank of France to 3½ per cent. The foreign markets are taking more and more of our securities each week, and it may be that this demand will be sufficient to prevent further gold exports. The upward movement in prices at the Stock Exchange which began two weeks ago has continued, and has gained strength as the week has advanced. The large speculative capitalists who started the upward movement continue on the side of higher prices, and, besides the foreign demand for stocks, the domestic speculative and investment demands have been large. The business of the railroads is said to be good, and this more because of the increase in local and miscellaneous traffic than on account of the movement of grain, which continues comparatively light. The general trade of the country is apparently sound and prosperous; the amount of goods changing hands is very large; credits are not unduly expanded, and collections are good. A bad feature, however, is the labor trouble, which in the Eastern textile factories and in the coal districts has assumed important proportions. The course of our foreign trade continues to run toward increasing merchandise imports and diminished exports.

The bill "regulating" the Chinese immigration is now before the President, and there is some talk of his vetoing it. The only ground on which he could do so would be that it violates the Treaty of 1880. That provides that the United States Government "may regulate, limit, or suspend the coming or residence" of Chinese laborers, but "may not absolutely prohibit it," and that the limitation or suspension shall be "reasonable." The bill suspends the immigration for twenty years, and the question is raised whether this is reasonable, and on this question the President will probably have to pass. It may be said as a general rule that any legislation fixing a period during which a human being may or may not do a thing, must, in order to be reasonable, take into consideration the length of human life. A man's working years, or the period during which he is likely to take any important step, such as emigration, for the bettering of his condition, may be said to run from his twentieth to his forty-fifth year. To prohibit a Chinese laborer from coming here for the next twenty years would therefore amount in practice to total prohibition for all laborers who have already reached their twentieth year, or, in other words, for the generations which have already reached manhood. We do not see how this can possibly be considered reasonable, or can be regarded as anything but an evasion of the treaty. Five or even ten years' suspension would not be open to the same objection, because it would only cover a quarter or half of a man's years of enterprise and hard labor, and would serve all the purposes of an experiment, and might be renewed, if the "Mongolian hordes" still threatened us, at its expiration.

The President will do well to bear in mind, too, that as a party measure for use at the next election, the bill has already failed. It was introduced to "make capital" for the Republican party on the Pacific slope. The Republicans were by means of it to appear to the industrious whites of California to be holding the door firmly against the heathen rush. But the Democrats have in a most disgusting manner come in and voted more solidly for the bill than the Republicans. They are, therefore, entitled to half the capital which may be made out of the enterprise, and if one side gets as much capital out of it as the other, it is the same thing as if neither got any at all. The President can, therefore, deal with the measure without regard to party benefit, on broad grounds of public policy and national good faith. He may very profitably consider, too, the possible future inconvenience of putting in the statute book a formal recognition of the different social and political values of different races. He must have noticed how eagerly the Southern whites welcomed the acknowledgment which the bill makes that race may be an incurable defect for political purposes, and that particular localities have a right to call for national legislation against any race they do not like. Nothing could be more convenient for those who maintain that the negro problem is not yet settled, and who may some day in the not very far future be a more potent body in Washington than they are now. In fact, Senator Jones admitted as much in his speech, Republican though he be.

The effect of mere bluster in the conduct of foreign relations can scarcely be more forcibly illustrated than by Mr. Blaine's attempts at a "spirited foreign policy." His celebrated despatch to Mr. Lowell on the exclusive right of the United States to protect the neutrality of the interoceanic canal, or rather to control the latter—a despatch in which the tail of the British lion was demonstratively twisted—had the natural effect of making the question a matter of national honor with Great Britain, and of drawing from Lord Granville a very cool but very decided reference to the Clayton-Bulwer Treaty, with an array of argument which Mr. Blaine did not show himself able to meet. The attempt to urge the mediation of the United States upon Mexico and Guatemala, to settle a boundary question between them, resulted in a note from the Mexican Government teaching the American Secretary of State a very impressive lesson in history, and then in a settlement of the disputed question without American interference. And now it is reported by telegraph that the Colombian Congress is likely to call upon the Executive of that Confederation "to give a year's notice to the United States of the intention of the Government of Colombia to withdraw from the stipulations and obligations of the treaty of December 12, 1846, between the two countries." It is further stated that "Article 35 of that treaty is particularly condemned as vague and not easy of interpretation, and likely to bring about discord between the contracting parties." This is the very same article referred to by Mr. Blaine in his despatch to Mr. Lowell as entrusting the United States with the exclusive right and duty to protect the neutrality of the interoceanic canal. It appears now that the manner in which Mr. Blaine availed himself of that article in his discussion of the canal question resulted in starting in the Colombian Congress a movement in favor of rescinding the whole thing, and of "paving the way for a joint guarantee of neutrality between the Republics of the New and the commercial nations of the Old World in behalf of the Panama Canal."

Shipherd's testimony on Wednesday week was more guarded than that given the day before, and seemed to indicate a desire to "hedge"; but he stated one or two facts of some importance as giving a clew to his own mysterious operations in connection with the Peruvian Company. It seems that he retained as "counsel" not only Senator Blair and Mr. Boutwell, but Mr. William H. Robertson, Collector of this port. He declares that Senator Blair at first refused to take a retainer, but afterward consented to take one, which he finally returned on finding that the matter was to come up in Congress. There is nothing remarkable in Shipherd's retaining lawyers; but why should he retain these three particular men? As to Senator Blair, he testified on the 21st instant that his motive was to get the ear of Mr. Blaine, with whom the New Hampshire Senator was on intimate terms; he now says that this was also one of his reasons for employing Mr. Boutwell. To use his own words, "the further question was discussed as to just how the Secretary of State should be approached; my own suggestion was that the approach should be made by Governor Boutwell; that he was counsel for the United States [in the Franco-American Claims Commission]; that the Secretary of State was in such relations to him that he could at any time have proper access to him; and I asked him to un-

dertake this affair." The retainer of Mr. Robertson was undoubtedly dictated by the same motive. It is, at least, difficult to see any possible reason for thinking of him as one of three lawyers in all the length and breadth of the United States to do legal work for such a concern as the Peruvian Company, except his being one of the most prominent "Blaine men" in the country. Shipherd's account of his interviews with Messrs. Boutwell and Blair is very funny when we remember what the Cochet claim against Peru is. Mr. Boutwell declared that there was "not a flaw in it," while Mr. Blair remarked that the Cochet claim opened to the United States "the grandest opportunity that was ever afforded to a nation in the history of the world."

Senator Brown, of Georgia, while speaking in favor of the Tariff Commission Bill, admitted that the tariff was unjust in some particulars, but contended that it would be necessary to raise some $200,000,000 of revenue yearly from it, and that it should be adjusted so as to promote manufacturing interests. He did not say this as a possible Republican or as an Independent, but as a representative of the Democratic party, of which he protested that he was "proud to be a member." He announced that this grand old party "would not in the next campaign insert in its platform a plank of tariff for revenue only." It might be said that it makes little difference whether the Democrats do so or not, because in 1880 they were afraid to use it and promptly threw it away. Still, if they shall be of the same mind in 1884 that they were four years earlier, for the sake of consistency and frankness it is to be hoped they will say what they mean. Senator Brown predicts that they will do this, and that the party will "speak for a tariff for revenue with incidental protection." This would not be surprising. It would only illustrate the curious and fatal capacity of the Democratic party not only for holding fast to old doctrines which have become obsolete and have lost favor with the people, but also for abandoning time-honored principles at the very time when they show fresh vitality and are gaining wider popular acceptance.

Now that there is to be an attempt to construct a new navy, we trust it will be borne in mind that the navy consists of men as well as of ships, and that no improvements or outlay in construction will make up for low morale in the crews. If we may judge from the goings-on of a certain portion of the public in the Mason case, our respect for discipline does not increase in the same ratio as our wealth and mechanical ingenuity. Putting drunken men back into the service after dismissal by court-martial is a practice for which no skill on the part of our shipbuilders can compensate. But this is only part of a series of abuses. Officers unfit for their places for other reasons than drunkenness are kept in the navy, by the practice—of which, by the way, we have just had an example in the Whittaker case and the Mason case—of setting aside the verdicts of courts-martial on technical grounds without ordering a new trial; by the abuse of the pardoning power, which is the drunkard's best friend; and by Congressional influence in reversing decisions of naval courts and retiring boards. In fact, public sentiment with regard to the moral side of the navy problem is in a decidedly lax condition, and something ought to be done to brace it up while we are constructing those new ships which are to make the British property-holder quake in his boots. He would not quake a bit if he knew how many drunkards we kept in commission, and how much pardoning of naval scamps we did, no matter what stories he heard of what was going on in our navy-yards.

Judge-Advocate-General Swaim, who, after recommending the setting aside of the finding of the court-martial in the Whittaker case on a technical defect, has now done the same thing in the Mason case, without in either instance ordering or recommending a new trial, may be a very useful sort of man for an Administration to have on the premises, but it is nevertheless true that his performances are excellently well calculated to bring military justice into complete contempt. In fact, as long as the United States has him in its service the need of courts-martial does not clearly appear. Those that are held under his rule appear to resemble much the jury which was summoned in Nevada by some lynchers to try a Mexican horse-thief. It once or twice brought in a verdict of acquittal, but was sent back by the presiding Vigilant for further consideration. At last, seeing what was wanted, it found the man guilty, and was thereupon informed by the court that this time its verdict was correct, and that to save time the culprit had been hanged about half an hour previously. If the Whittaker and Mason courts-martial had been more knowing, they might have saved themselves a great deal of trouble by finding out beforehand what kind of verdict was needed. Courts-martial whose findings can be set aside on technical grounds by anybody's order, without the ordering of a new trial, are, to speak plainly, mere farces; and if the practice of setting them aside in this way in important cases goes much further, it will be far better, both for public morality and military discipline, that they should be abandoned as a means of administering justice. There has been so much of it in both the Army and Navy of late, in cases which do not attract public attention, that it is no exaggeration to say that American naval and military service has ceased to be governed by law, and has passed, like that of the Sultan, under a régime of favoritism worked through intrigue. The Whittaker and Mason cases differ from many which have gone before only in their conspicuousness. If the Judge-Advocate can set aside decisions of the military courts on technical grounds, without directing a retrial, which furnishes the only check on arbitrary or corrupt interference with the course of justice, he had better be allowed to announce openly beforehand which offenders he wishes to be punished and which to go free, and thus save expense, and above all save the country the scandal of having courts of justice turned into a laughing-stock.

Whittaker had been found guilty by the court-martial of imposture and perjury, and sentenced to dismissal from the service and imprisonment. He will now escape punishment as a criminal, but will not be, as he confidently expected, wholly restored to his place in the Academy. He is dropped for want of proficiency in his studies, and says he is going to learn shorthand and become a reporter or some kind of journalist. The moral injury which has been done him by sending him to West Point is probably irreparable, and the Congressman to whom he owes his nomination has much to answer for. Persons who are put into new and trying positions in order to make good the title of an oppressed race or class to equal rights, should be carefully selected and made of the very best stuff, because their failure is not and cannot be an individual misfortune simply. Poor Whittaker, however, seems to have had no qualification for the responsibility that was thrust upon him, except his color, and prejudice against color cannot be conquered simply by color. He has now left his race worse off by far than if he had not gone to West Point at all. We trust that when the next trial of a colored cadet is made he will be carefully selected, and offer the best guarantees as to his moral and mental stamina.

General Swaim's report in the Mason case may be called absolutely original, and merits the attention of Mr. Gilbert, the operatic author. He recommends the setting aside of the decision, on the ground that Mason, when he fired in through the window of Guiteau's cell, did not see Guiteau, who, as a matter of fact, was reclining on his cot, and had a substantial brick wall between him and his assailant, and could not have been hit by the ball. Moreover, "the exclamation of Mason, after having fired, that he didn't know whether he killed Guiteau or not, shows that he fired purely at random, without any reasonable certainty of assaulting him or killing him." Accordingly, if you knew a man was lying under a bundle of hay in a barn, and you wanted to kill him, you would be at liberty to fire liberally into the hay without being guilty of a felonious attempt, provided you "exclaimed" afterward that you did not know whether you had hit him or not. Under the same rule, the practice of the Irish intimidators of firing in through the windows of houses would be, too, reduced to mere glass breaking. One might shoot a man in the breast at point-blank range, but if it turned out that he had on a bullet-proof vest, and that the ball had glanced off, he could not say that an attempt had been made on his life. General Swaim thinks the court might have found Mason guilty of conduct prejudicial to good order and discipline in firing off his rifle at all, but as it did not, there is nothing for it but to let him go free. We trust the President, in spite of the "pressure" brought to bear on him, will deal with this matter in a manner worthy of the best morality of the country. In any case, it would be far better to pardon Mason boldly on the ground that he was a good fellow, than release him on the wretched quibbles which General Swaim has dished up.

The Irish in this city are making use, in behalf of the Irish-Americans now confined in British dungeons, of the Act of Congress of July 27, 1868, in order to urge the President into taking some action for their liberation. The Act says that "whenever it is made known to the President that any citizen of the United States has been unjustly deprived of his liberty by or under the authority of any foreign government, it shall be the duty of the President forthwith to demand of that government the reasons of such imprisonment, and if it appears to be wrongful, and in violation of the rights of American citizenship, the President shall forthwith demand the release of such citizens." This act is pure buncombe, and if the Irish had more regard than they seem to have for their reputation for political sense and shrewdness, they would not only expect no good from it, but would never publicly mention it. It was passed in 1868 to stop the mouths of the Fenians, and has every mark of contempt for the Irish understanding. It cannot be "made known" to the President that a man has been unjustly deprived of his liberty in a foreign country, without a judicial inquiry, and even if the judicial inquiry showed that he had been unjustly imprisoned, the President would have no right to demand his release unless he had been *illegally* imprisoned. The President cannot see that Americans abroad get abstract justice; his business is to see that they get legal justice. Moreover, he has no shadow of authority, nor can Congress give him any, to demand the liberation of any prisoner held by the constituted authorities of a civilized state. All that he can ask for is that such prisoner be brought to trial, so that his guilt may be judicially ascertained. It is only through such trial that the President can know whether "the imprisonment is wrongful, and in violation of the rights of American citizenship." If the ordinary criminal court of the country finds the American citizen guilty, the President's mouth is closed, whatever his opinion may be of the verdict. All that he has a right to complain of in the case of the Irish-American "suspects" now in dungeons is that they are not brought to trial, though the courts are sitting, or else expelled from the country. This is a wrong, and ought to be remedied. Nothing does more to discredit the Irish cause with the civilized world than the way Irishmen allow themselves to be gulled by pieces of Anglo-Saxon demagogy like this act. An Irishman hawking it round as a cure for his woes is a most melancholy though somewhat ludicrous spectacle.

They have been having a judicial impeachment case in Minnesota, the facts in which are of some interest. The testimony will be found extremely entertaining by persons who find entertainment in that kind of testimony. According to a brief abstract given in the *Times*, it reveals the impeached judge in all conceivable forms of intoxication, riot, and debauchery. One class of witnesses describes him drunk in the court-room, unwashed, blear-eyed, maundering, bullying witnesses and lawyers, and making the transaction of business impossible. On several occasions court was adjourned to give him time to recover. Some of his official performances were most grotesque. One of his charges to the jury is known throughout the district as "Cox's temperance lecture." Another witness describes a case in Lyon county, in which Judge Cox held court in a saloon to issue naturalization papers, and demanded that the newly-made citizen should "treat" before he would sign the papers. It seems to have been the regular practice for court, bar, jury, witnesses, and spectators to get drunk together nightly, and the witnesses testified that Cox never passed the bottle. One witness wanted to describe a scene where the rest of the party rolled the fuddled judge over on his back and played cards upon his judicial abdomen, but the matter was ruled out. The judge has been removed by the Senate, and disqualified from holding judicial office for three years—a sentence which is almost as entertaining as the evidence.

While it is impossible not to sympathize with the feelings of Dr. Lamson's relatives and friends over his present unhappy plight, we trust there is no truth in the story that they are trying to get Mr. Lowell to ask for a reprieve in order to give time to produce evidence, not that Dr. Lamson is insane, but that there is "insanity in his family." This ought to be impossible after the exhibition of the insanity defence which we have been offering the world in the Guiteau case. No suggestion of Dr. Lamson's insanity was made before or during the trial. No such suspicion appears to have been entertained about him. The evidence of his having procured and administered aconite to his brother in-law was overwhelming, and that of his having made a similar attempt on him previously was almost equally strong. The motive was supplied by the fact that he would get possession of half the boy's estate. The amount was small, it is true, but it was large for a man who was unable to pay his board bills. The one circumstance in his favor, that he went to London to surrender when he heard he was suspected, is neutralized by the fact that he might have been arrested in France, and that he had no money to fly with, even if flight would not have been a confession of guilt.

There is no question of the fairness of the trial, or of the ability of the defence. In the transaction itself, as proved on the trial, and in the Doctor's demeanor during the trial, there was every sign, not only of sanity, but of great acuteness and deliberation. It is not surprising that his friends should exhaust every resource to procure a mitigation of punishment, but it is no part of the United States Minister's business to interfere in the matter, because there is no way in which the case can be made to wear an international character. Moreover, no one who reads the evidence can avoid seeing that if Dr. Lamson were held to be insane on the ground that there was insanity in his family, it would amount to a plenary indulgence for everybody who could show that he had at some time or other had an aunt, or cousin, or grandmother in a lunatic asylum. This would enormously increase our criminal population, and strike the most tremendous blow against moral responsibility the world has ever seen. There is nothing deducible from a man's having had insanity in his family, except a tendency to insanity. It does not follow, because a man has had an insane father or mother, that he is himself insane. It only follows that he has a constitutional liability to become insane. Nor would it follow that if such a man committed a crime, it was the madness working in him which led him to commit it, unless we could show that the sane never committed crimes. The fact is, however, that the immense majority of crimes are committed by persons who must be considered sane, if anybody is to be considered sane and society is to be held together by laws. The only theory on which it is possible for courts and juries to work in dealing with crime is, that every man must be punished for doing what he knew beforehand would bring upon him punishment which he feared and tried to avoid. This may not be a perfect hypothesis, but for the purposes of civilization it is a good working hypothesis, and must endure till something better is discovered.

The division in the House of Commons on the question of adjourning the debate on a resolution calling for the equalization of the borough and county franchise, will probably furnish the Ministry with an additional reason for pushing the closure. The majority against it was only 192 to 137, but it showed that the House was ready to entertain the proposal if made, or was, in other words, an invitation to the Ministry to bring in their County Franchise Bill. Lord Hartington has announced in various speeches that if they do not get the closure they will dissolve Parliament, which has acted as a powerful whip on the lukewarm Liberals, and will probably make them ready for anything in reason. In these times few members are sure of reëlection, and it costs nearly every man $5,000 to secure it, and there are not many Liberals who would not sooner follow Gladstone as far as he is likely to go than incur this risk and outlay. With the county franchise lowered to the borough level, the Ministry could go to the country with a tolerable certainty of gaining enough county seats to make up for the loss which they will undoubtedly incur in Ireland. It is all but certain that forty or fifty Parnellites will take the place of as many Irish Liberals, giving the extreme Irish section the power of turning the scale, if the English and Scotch members remain divided as they are now. So that it is almost a necessity for the Ministry to make a further inroad into the Conservative strongholds—the counties—at the next election. In the boroughs at present every man who is a householder and pays poor rates, or is a lodger in lodgings which, unfurnished, would rent for fifty dollars a year, has a vote. In the counties the voter must, besides being a ratepayer, be the owner of lands bringing $25 a year over and above all rents and charges, or the occupier of lands of the ratable value of $60 a year. This excludes the farm laborers and a large proportion of the village population, and gives the landlords in most counties the control of the constituency.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

THE House passed the Chinese Bill on Thursday in substantially the same form as it came from the Senate. This is the only business of importance which has been done by the House during the week.

The Chinese Bill has been sent to the President, but he will not act upon it until the question has been considered and examined in all its bearings by the Cabinet.

The Senate passed the Tariff Commission Bill on Tuesday, by a vote of 38 to 15, after an uninteresting debate, and the discussion of the bill in the House was begun on the same day.

The Senate Committee on Civil Service authorized Senator Pendleton, on Tuesday, to report the Civil-Service Reform Bill as it was originally introduced by him in the early part of December.

The Senate Committee on Foreign Relations has agreed to report for ratification the two commercial treaties recently negotiated with Servia and Rumania. The Committee on Military Affairs has agreed to recommend the passage of a bill to increase the permanent annual appropriation of $200,000 for arming the militia of the several States and Territories to $600,000.

The Speaker laid before the House, on Monday, a communication from the Secretary of the Interior, in response to a resolution calling for an estimate of the amount of money which would be required to pay the pensions of the survivors of the Mexican and Indian wars prior to 1846, from which it appears that $65,380,480 will be required to pay the Mexican war pensions, and $28,201,632 to pay the Indian wars pensions.

The House Committee on Education and Labor has reported adversely a bill to reimburse the College of William and Mary in the sum of $65,000 for property destroyed during the late war.

The House Committee on Appropriations have decided to recommend non-concurrence with the Senate amendment to the Post-office Bill, restoring the franking privilege to Senators and Representatives.

The examination of Shipherd before the House Committee on Foreign Affairs was continued on March 22. The witness said that no offer of stock had been made to any officer, "diplomatic or otherwise," except General Hurlbut, and that no intimation had been made to him by any officer of a desire for an interest in the company, and that no officers of the United States had any interest in the company except Collector Robertson, of New York, who had received a retainer for legal services. The other testimony was in regard to the way in which Shipherd had become interested in the company, and other matters of minor importance. On Thursday the examination was continued, and Shipherd testified that overtures had been made to another member of Congress besides Senator Blair to accept a retainer from the company, but that it was finally declined, "on the sole ground that the interests involved might in some form come before Congress." When asked what were his motives for engaging the legal services of this gentleman—whether it was on account of his political relations to the Executive Department or simply for his legal ability—Mr. Shipherd replied that it was for "reasons purely personal to the member himself, as distinguished from any aid which he might render as a member of Congress." On Friday a physician's certificate was presented to the committee, stating that Mr. Shipherd was ill and would not be able to leave his room for several days, and the investigation was thereupon adjourned.

The Washington *Post* printed an interview with Mr. Blaine on the Chili-Peru question on Friday. Mr. Blaine maintained that "Peru is to be despoiled, and that the profits of the spoliation are to be divided between Chili and the English bondholders and speculators," and says he thinks "the moral power of the United States judiciously exerted could have saved the autonomy of Peru," and that the talk of a possibility of a war with Chili was "arrant nonsense," and that, as the result now stands, "we have acquired the hatred of the Peruvians to the latest generation, and at least the contempt of the Chilians."

Señor Martinez, the Chilian Minister at Washington, has received official despatches from his Government confirming the authenticity of the text of the protocol agreed upon between the Chilian Government and Mr. Trescot, as already published. Señor Martinez says that the conditions set forth in the protocol represent the extreme limit of concession which Chili will grant to Peru.

The President has approved the act establishing the northern boundary of the State of Nebraska, the act relative to the lease of Government lands at Plattsburg, New York, and the act authorizing a railroad bridge across the Mississippi River at Wabasha, Minnesota.

Judge-Advocate-General Swaim has made a report to the Secretary of War on the case of Sergeant Mason, in which he holds that the sentence of the court-martial is invalid on account of certain irregularities and informalities in the proceedings of the court. Immense petitions continue to be presented to the President asking for Mason's pardon.

The Secretary of War has issued a special order dismissing Cadet Whittaker from the Military Academy, on the recommendation of the Academy Board, because of deficiency in his studies.

The Secretary of the Treasury has received information that the investigation into the opium-smuggling transactions recently detected in San Francisco develops a scandalous conspiracy to defraud the Government on the part of certain city and Federal officers. The conspiracy was revealed through a correspondence conducted in the Chinese language.

Secretary Hunt received a cable despatch from Lieutenant Harber of the *Jeannette* search expedition on Saturday, announcing the arrival of himself and Master Schuetze at Irkutsk in good health.

Attorney-General Brewster has written a letter to Dallas Sanders, Assistant District Attorney of the United States at Charleston, S. C., urging the prosecution of the election cases there, beginning with the most influential persons accused.

It is said that there is little doubt that the Secretaryship of the Interior has been offered to Senator Teller, and that his nomination will be sent to the Senate in the latter part of the week.

Speaker Keifer has removed Mr. Hayes, the official stenographer of the House, apparently solely for political reasons, since Mr. Hayes is a Democrat. This action on the Speaker's part is without precedent, and will probably be the subject of discussion in the House in a few days.

The New York Board of Trade and Transportation have sent a letter to members of Congress enclosing a petition signed by 2,000 of the "best firm names" in New York, favoring the Lowell Bankruptcy Bill.

The Mormons are said to be strongly in favor of the appointment of non-residents of the Territory for Election Commissioners under the Edmunds bill, on the ground that the appointees to Federal offices in the Territory are "scalawags." The Gentiles, on the other hand, consider the Mormon unanimity for a commission of strangers a strong argument against it, and think that there is danger of non-residents not understanding the situation, and of their being, for that reason, "hoodwinked, tricked, or cajoled."

A report has been received in Washington from Captain Wheeler of the Engineer Corps, the delegate of the United States to the Geographical Exhibition and Congress at Venice. Letters of distinction, which were the highest awards at the Exhibition, were awarded to the Corps of Military Engineers and to the Departments of War, the Navy, the Treasury, and the Post-office, for publications issued by these several departments on scientific and other subjects.

Mr. John H. Smyth, of North Carolina, was nominated by the President on Thursday to be Minister-Resident and Consul-General to Liberia, to succeed the late Dr. Garnet. "He is a young man, a lawyer by profession, and one of the blackest men in the world," and occupied the position of Minister to Liberia before Dr. Garnet's appointment.

Proceedings in the Star-route cases were begun in the Criminal Court at Washington on Saturday. The various counsel for the defence filed motions to quash the indictments, but the motions were not argued, and it was decided to postpone further hearing as to Dorsey and Brady until Friday next. The persons indicted in the straw-bond cases, however, were arraigned, and all entered a plea of not guilty. Attorney-General Brewster has decided not to fill the vacancy in the Star-route counsel caused by the retirement of Colonel W. A. Cook, but will select additional counsel to assist Mr. Bliss.

Mr. Charles H. Reed, counsel for Guiteau, has had an interview with General B. F. Butler at which he tried to persuade him to enter the Guiteau case for the defence. General Butler, however, declined to have anything to do with it.

The Republican Congressional Campaign Committee met in Washington on Monday night, and elected Mr. J. A. Hubbell, of Michigan, as chairman.

The strike at Lawrence, Mass., still continues. Nearly 5,000 persons are now out of employment. They are quiet, and no act of lawlessness has yet been reported

The waters in the Mississippi Valley are slowly falling. Great suffering continues in some regions, however. The Secretary of War ordered that 250,000 rations be purchased in New Orleans on Saturday, for the use of the destitute people of the Mississippi, and that 100,000 rations be issued to the Commissioner of the State of Arkansas at Helena. This issuing of Government rations is said to be having a demoralizing effect on the negro laborers in certain sections, many of them refusing to do any work, saying that the Government would send them rations.

The American Association of the Red Cross has issued an appeal asking for contributions to send its agents among the sufferers by the recent floods, "with a view to ameliorating their condition, so far as it can be done by human aid."

Henry Wadsworth Longfellow died at Cambridge on Friday, having just entered on his seventy-sixth year.

FOREIGN.

A resolution was submitted to the Congress of the United States of Colombia at Bogota, on the 15th of February, calling upon the Executive to give a year's notice to the United States of the intention of the Government of Colombia to withdraw from the stipulations and obligations of the treaty of December 12, 1846, between the two countries. The Executive is authorized to enter into new treaties with the United States and the Spanish-American republics of the Continent, with a view to conciliating, if possible, all the legitimate interests concerned in the free transit of the Isthmus of Panama. Article 35 of the treaty of 1846 is particularly condemned as vague and not easy of interpretation, and likely to bring about discord between the contracting parties. The resolution was passed with a view to paving the way for a joint guarantee of neutrality between the republics of the New and the commercial nations of

the Old World in regard to the Panama Canal.

In the House of Commons on Monday evening there was an animated debate on the proposed rules of Parliamentary procedure. Mr. McCarthy assured the House that there had been no conspiracy of conciliation between the Home Rulers and Conservatives. Mr. Gladstone said he believed it was the general feeling of the House that a division should be taken on Thursday next. Mr. Thomas Sexton then announced that he had received a telegram from Messrs. Parnell, Dillon, and O'Kelley, stating that they had asked Mr. Forster for permission to be present at the division, and had undertaken to refrain from any other political action during their absence from prison, and to surrender after the division. Mr. Sexton asked whether permission would be granted, and the Speaker ruled that the question was disorderly. During the debate on the motion for adjournment the Parnellites declared that if fair play was not granted them, they would use all forms of the House to obstruct debate.

The O'Donoghue, replying to Justin McCarthy's circular to the Home Rulers, urging them to vote against the *clôture*, says that the defeat of Mr. Gladstone's Ministry would be fatal to the best interests of Ireland, since it would hand over the Land Act to those who would do their best to defeat its workings. He thinks that if wise counsels had prevailed, Ireland would already be contented, and that the *clôture* is the legitimate and necessary assertion of the power of a majority.

Mr. Forster made a speech in the House of Commons on Tuesday night, on the Irish situation, which was greatly cheered. He admitted that the Protection Act had not done a great deal, but declared it had done something, for it had prevented many outrages and murders. He said there were signs of hope in Ireland, but that outrages must be stopped, and if they were not, it would become his duty and the duty of the House of Commons to provide still stronger measures.

Outrages in Ireland appear to be increasing again. On Friday night a party of thirty armed men attacked the house of a farmer near Thurles, County Tipperary, but were repulsed by a party of police who killed one of the men. Another despatch reports a case in which a band of disguised men cut off the nose of a man because in a Poor-Law Guardian contest he canvassed in opposition to the candidate of the Land League. Other outrages of various kinds are reported.

There have been disturbances in Galway, Ireland, between the Eighty-eighth Regiment (the Connaught Rangers) and the Eighty-fourth, an English regiment. On Thursday night the Connaught regiment, assisted by a mob, attacked a picket of the English, and "cheered for Ireland." There were several bayonet wounds on both sides.

Mr. Parnell has declined to write letters from Kilmainham Jail, unless under very exceptional circumstances, as he objects to imposing on the governor of the jail "the unpleasant duty of reading private letters."

Patrick Egan, treasurer of the Land League, has received during the past month £22,000 from the branches of the League in the United States and the English colonies.

In a debate in the House of Commons on Wednesday evening, on a motion declaring in favor of the equalization of borough and county franchise, on a motion for adjournment of the debate, the vote was 192 to 137 against it. Mr. Gladstone had intimated that the vote would be taken as indicative of the opinion of the House on the main question. The result is considered as having settled the question that the regulation of the county franchise is clearly within the mission of the present Parliament.

In the House of Commons on Thursday, Mr. Gladstone moved an annuity of £10,000 for Prince Leopold, and a pension of £6,000 a year for his widow in case of his death. Mr. Samuel Story, Radical member for Sunderland, objected to "spending the public money in support of titled idleness," and Messrs. Labouchere, Broadhurst, and Healy also made speeches opposing the grant; while three members of the Government, Sir Charles Dilke, Under Foreign Secretary, Henry Fawcett, Postmaster-General, and George Otto Trevelyan, Secretary to the Admiralty, abstained from voting. The motion was passed by a vote of 387 to 42.

The case of Dr. Lamson, an American doctor who was recently convicted of poisoning a relative of his, and who has been sentenced to death, is exciting great interest among Americans abroad, a large meeting of whom was held in London on Monday to take some action in behalf of the prisoner. Many affidavits were read and much verbal testimony given, going to prove that he is insane, and a resolution was unanimously adopted requesting Mr. Lowell to urge a reprieve on the ground of insanity, the proofs of which were considered very strong and convincing.

An invitation, signed by 300 persons, including the Earl of Shaftesbury, Earl Cairns, Mr. Samuel Morley, Canons Farrar and Fleming, and a number of other prominent men, has been sent to Messrs. Moody and Sankey, who are now at Glasgow, asking them to spend a year in London in evangelical work.

The Emperor William's birthday was celebrated in Berlin on Wednesday, the 22d. The city was gayly decorated, and crowds cheered the Emperor. In replying to a deputation of the Conservative Central Committee, who presented an address expressing devotion to his Majesty, the Emperor said that "the times were serious, and considering that the Czar a year ago had fallen a victim to party anarchy, who could now feel himself safe?" The Emperor added that he had learned with pleasure that the country approved his recent message. Dinners were given to celebrate the occasion by the Czar and the Emperor Francis Joseph, in St. Petersburg and Vienna, respectively, at which the Emperor William was toasted.

The object of fixing the coronation of the Czar for a late date is said to be to permit the exhibition at Moscow, which will open in May, to be closed before the occurrence of the ceremony. It is thought that if the two events were to occur simultaneously, the great concourse of people attending the exhibition would give an opportunity to the Nihilists who, as is shown by recent arrests, are concentrating their forces in Moscow.

General Skobeleff, speaking at a banquet in his honor in St. Petersburg, on Wednesday evening, toasted the British nation, and referred warmly to the friendly relations between England and Russia.

The London *Jewish World* received a telegram from St. Petersburg recently, stating that the Czar had refused to confirm the recommendations of the Commission on the Jewish question (that the Jews be compelled to quit the rural districts) on the ground that such expulsion would almost ruin agriculture, and that the recommendations are generally conceived in a vindictive spirit. It is reported that General Ignatieff has ordered all the Jewish chemists of St. Petersburg to sell their businesses.

The Turkish Government, after much delay, has granted permission to a Russian transport, with convicts and troops for Siberia, to pass through the Bosphorus, on the condition that this permission be considered unique and shall never be cited as a precedent.

The Governments of England and France have instructed their representatives in Egypt to request of the Khedive a special hypothecation of the revenues assigned to the service of the international debt, and the other Powers have approved the demand.

Despatches from Tunis state that the Italian Consul has made a formal protest against the concession of the esparto monopoly to a French company as a flagrant violation of the treaty between Italy and the Bey of Tunis. Sir Charles Dilke also stated in the House of Commons on Thursday that Lord Lyons, the British Ambassador at Paris, had been instructed to call the attention of the French Government to the esparto monopoly in Tunis.

Eight French generals are said to have assembled in Tunis to form a definite plan for a campaign in the south of Tunis.

In the French Chamber of Deputies on Tuesday a credit of 8,000,000 francs for the Tunis expedition for the second half of the current year was voted.

The French Budget Committee has been elected. It is largely favorable to M. Say's financial proposals.

The bill to repeal the prohibition of American pork has been the subject of discussion in the Chamber for the last few days, and on Tuesday it was passed with an amendment authorizing Minister Tirard to prescribe the mode of inspection.

The Committee on Petitions of the French Chamber of Deputies, after conferring with M. de Freycinet, the Prime Minister, as to the best means of ending the scandal of the Monaco gaming tables, has decided that the subject is not one for the consideration of the Chamber, but for diplomatic action.

A Paris despatch states that the Governments of France and the United States have formally notified the powers that the reassembling of the Monetary Conference must be indefinitely postponed. The object of the postponement is said to be "to allow public opinion in England to ripen."

Statements have been made to the effect that the Emperor Francis Joseph was meditating a visit to King Humbert, but negotiations have been suspended since the Italian Ambassador intimated that King Humbert would be happy to welcome the Emperor in Rome, which appears to have displeased Francis Joseph, as he had formerly shown great consideration in meeting the King of Italy in Venice. A meeting in Rome is regarded as out of the question, since a meeting there would certainly offend the Pope.

Signor Magliani, the Italian Minister of Finance, presented his financial statement to the Chamber of Deputies on Saturday, from which it would appear that Italian finances are in a flourishing condition. The ordinary receipts exceeded the ordinary expenditures for the year 1881 by 140,000,000 lire. The surplus for 1882 is estimated at 7,000,000 lire, in spite of an additional 12,000,000 allotted for army purposes. The Minister of Finance gives absolute assurances that the abolition of the forced currency will be completely accomplished as soon as the Treasury obtains a sufficient metallic reserve.

At a consistory held on Monday the Pope created seven Cardinals, including Archbishops McCabe of Dublin, Lavigerie of Algiers, and Luch of Seville. The Pope afterward delivered an allocution on the position of the Church. On Saturday he received Archbishop McCabe with the greatest cordiality.

Four hundred and fifty peasants from the Bernese Oberland have left for the United States. The emigrants are described as the flower of the population, and are mostly possessed of fair means, but are compelled to emigrate by the depression of agriculture.

Despatches from Madrid foreshadow a ministerial crisis in connection with the financial schemes of the Ministry.

A despatch from Pesth reports that sixty houses and fifty outbuildings at Böszenfa, Hungary, and 248 houses at Paka, have been burned, leaving several hundred families in a destitute condition.

M. Sully Prudhomme has been received at the French Academy as the successor to Prosper Duvergier de Hauranne, deceased.

TUESDAY, March 28, 1882.

MORE OF MR. BLAINE'S INTERNATIONAL LAW.

THE interview with Mr. Blaine on the Chilian treatment of Peru, which appeared in the Washington *Post* on Friday morning, increases the difficulty which we have all along experienced in discussing Mr. Blaine's foreign policy. This difficulty arises out of the fact that no study of his writings on international law will enable even the most perspicacious mind to discover what are his notions of the rights and duties of a friendly neutral toward two belligerents. That they are not those of any of the accepted text-books is, after all, a small matter, because a candidate for the Presidency may fairly be allowed to construct a system of international law of his own. But the fact that it does not seem possible to adapt them to any state of affairs now existing, or likely to exist, on this globe, is a very serious matter. He has laid it down that though a conqueror may exact the cession of territory as the result of his conquest, yet he ought not to do so until he has asked for and failed to receive a cash indemnity—a doctrine which is absolutely novel. He has also declared that the conqueror is not "a safe or impartial judge" in the decision of the question whether the conquered shall pay in money or in land, but is bound to allow it to be settled by a neutral. He has also ruled, that in order to justify a neutral in recognizing a government, it is not necessary that it should be a *de-facto* government whose authority is obeyed by the population over which it claims jurisdiction; that all that is needed is that it should be a government which the neutral likes, and thinks would govern well if it got a chance. Finally, he treats the arrest of such a government by the conqueror, and confinement in prison, as something in the nature of a *casus belli* as regards any neutral which may have recognized it. All this is very startling.

In the interview published as above he is, if possible, still more novel and entertaining. Commenting on the lately reported Chilian protocol of the agreement with Mr. Trescot, he treats Mr. Frelinghuysen's instructions to Mr. Trescot not "to dictate or make authoritative utterances" to either Chili or Peru as to the terms on which they should make peace, as a concession that the English bondholders should "have their own way, with none to molest them or make them afraid." As the English bondholders are simply persons who have lent Peru money, it is difficult to see why they should be "molested or made afraid" by anybody as long as they are not engaged in crime, and more difficult than all to see why our Government, which has a great many English bondholders of its own, should be bound to see that Peru's English bondholders were alarmed or annoyed.

Mr. Blaine comments with much severity on the proposed annexation of the district of Tacna besides Tarapaca, and says Chili has added this on to her original demand since Mr. Trescot arrived with his new instructions. But we believe we are right in saying that Mr. Blaine never knew what Chili's original demand was. He only guessed it; so that what has now been revealed to him is not that Chili is asking more than she began by asking, but more than he thought she was going to ask, his notions of Peruvian geography having all along been exceedingly and, to some people, amusingly vague. All this he holds to be distinctly "discourteous" to the United States, but what he must mean is that it is discourteous to himself. There is no more discourtesy to the United States in this than in the annexation of Alsace and Lorraine by Germany, or of Bosnia and Herzegovina by Austria; but it is discourteous to Mr. Blaine to pay no attention whatever to his utterances on international law, and of this Chili has been distinctly guilty, and ought to suffer the consequences of it, whatever they be.

He is especially severe on the Chilians for advertising for bids for 1,000,000 tons of the Lobos Islands guano, which is to be paid for, he says, "in good sterling exchange—English money, mark you—at ninety days' sight." It is almost painful to quote this remark from a man who has filled as high places as Mr. Blaine has done in the Government of his own country, because it shows so much curious ignorance of the parts played by "bills on London" in commercial transactions all over the globe. The suggestion that there is something significant politically in the exaction of "payment in English money, mark you," is worthy of the attention of Mr. Gilbert, the versatile author of "Pinafore" and "Patience," particularly as he goes on to point out with increasing solemnity that the guano will be carried away in English ships, "making a larger freightage than the cotton of the United States annually taken beyond the seas." It will undoubtedly be taken, as the American cotton is, in the ships of whatever nations offer freight at the lowest rates. This is the way, surprising as it may seem to Mr. Blaine, in which both guano and cotton dealers do business. They always hire ships with a view to profit, never for the glory of a particular flag. He closes with the following lamentation, which we trust is misreported:

> "For American interests it was the opportunity of a century, and it was blindly sacrificed. The commercial interests of this country in South America will not in fifty years recover what has been lost and what was in its power to acquire. Our interests are not only totally destroyed in Chili and Peru, but our prestige is impaired in all South America—indeed, in all Spanish America, both continental and insular. The present generation will not witness the recovery of that which has been lost within the last ninety days."
>
> "When you speak of commercial interests, Mr. Blaine, do you mean the shipping interests?"
>
> "I mean that," said Mr. Blaine; "but not that alone. I mean the entire interchange of commodities, the supplying of manufactured articles and raw material, the concentration in our commercial cities of a share of that which will now go wholly to London and Liverpool. The trade of the west coast of South America from this time forward will be as much in the hands of Great Britain as the trade of British India. But this opens a large subject, and I have neither time nor inclination to pursue it to-day."

We incline to think this misreported, because Mr. Blaine can hardly be as ill-informed as it would make him appear. He is not a Wilkins Micawber, and, whatever his defects as a lawyer, has shown himself a shrewd business man. The exports of the United States to Peru in 1881 amounted to $109,696; the imports from Peru to $781,911. If this business should "go wholly to London and Liverpool," and the present generation should be unable to get it back, it would cause a convulsion and a sense of "goneness" in the United States somewhat resembling those resulting from the failure of a dry-goods store in Bangor, Me. We have no returns of the British dealings with Peru later than 1879, but in that year the importations from Peru to Great Britain amounted to $16,942,660; the exports to Peru to $3,737,000. To crown all, the Peruvian foreign debt of nearly $200,000,000 is held almost exclusively in England, as is shown by the great preponderance of Peruvian exports to England over the amount of imports from England. Whenever American politicians get it into their heads with clearness that commerce goes where the market is good, and cannot be fostered by diplomatic meddling, or intrigue, or war, or high tariffs, or bounties, we shall undoubtedly get the South American business which London and Liverpool now do, but not sooner.

THE IRISH-AMERICAN "SUSPECTS."

THE answer of Sir Charles Dilke in the House of Commons on Friday, that the British Government was considering the representations made by ours on behalf of the imprisoned Irish-American "suspects," shows that the Irish-Americans are in more ways than was supposed a source of considerable embarrassment to the Ministry. What distinguishes the present trouble in Ireland from all those which have preceded it is the extent to which it has been promoted by money and encouragement from this side of the water. The Fenian outbreak in 1866 had, it is true, its origin largely in the United States, but the Fenian movement was a small and insignificant affair compared to the Land League. The former was essentially a military enterprise, and was therefore more easily dealt with than any other mode of expressing discontent. All that was needed to bring it to an end was a collision between the Fenian forces and the troops or police. When this occurred the movement collapsed, and fortunately it occurred with little or no bloodshed. The writer of a curious and interesting historical sketch of it in the last *Fortnightly Review* gives an amusing account of the one battle of the war in which the preparations, as far as entrenchment and the marking of distances in the line of approach went, were worthy of Bunker Hill. When the assaulting line, however, reached the fatal spot at which they were to receive the first volley, and the Fenian commander ordered a low and destructive fire, his troops appear to have been so much impressed by the absurdity of the situation that they abandoned him and the redoubt at the double, because, as one of them explained to a friend, "it was little like rebellion he felt, and the divil a differ he saw from yisterday." Moreover, the Fenian movement had no social side to it. It was purely political. It aimed at the establishment of some kind of republic, but not at a revision of the property laws.

Such as it was, however, it would never have come to anything if it had not been projected and supported in the United States. Its gravity in the eyes of the English Government was in fact largely due to the revelation it

made of the change which the Irish emigration to the United States had wrought in the Irish problem. It was clear that thereafter it was not with the malcontents in Ireland only that the Government would have to contend, but the malcontents in the United States also, whom the improvements in the means of communication were every day bringing nearer to their old home. The importance of the change was, however, not fully manifest till now. It is plain that the Land League, which is the most troublesome Irish organization with which the British Government has ever had to deal, would not have existed at all, or at all events have never assumed the proportions which it did assume, but for the money which came from America, and but for the encouragement given to it by Irish-American orators and newspaper writers. How valuable they have been to the cause was shown in a remarkable way by Parnell's change of policy with regard to the Land Act. He at first gave in his adhesion to it, but finding that his American allies were opposed to any such compromise, he turned round suddenly and began denouncing it and preaching the no-rent or next-to-no-rent doctrine.

It would of course be absurd for the English Government to shut up the Irish propagandist of the League, and let the Irish-Americans continue the work, for every Irish-American counts for at least five Irish-Englishmen as an apostle of sedition. The fact that he comes from "the States" gives his words a potency and promise in the eyes of the peasantry which those of the stay-at-homes never have. If he were to have his way, there would really be no use in keeping the Coercion Bill in force. But he is nominally a foreigner, and is nominally protected by the American flag. Consequently when he is put into a "dungeon," for the very things for which British subjects are put into jail, he does not seek relief in profane swearing simply: he appeals to the unfortunate United States Minister in London to achieve his deliverance, so that he can return to his old work. In fact, what he seeks is a kind of safe conduct, to protect him against the Irish police while he is engaged in encouraging the people to defy the Government and resist the law.

Of course one answer to him is ready and forcible enough—that he is either an American or an Irishman; that if an American, he must abstain from mixing himself up in foreign troubles; that if an Irishman, he must submit to the law and go to jail on the Chief Secretary's warrant. But this, though it may close the mouth of the man who is bawling from "the dungeon," does not relieve our Government from all embarrassment. No matter how culpable the Irish-American agitators may be, or how much they may deserve their dungeons, we can hardly admit that they may be punished without trial, or subjected to whatever punishment foreign law may prescribe. There is a limit to the operation of the doctrine that a man who goes to a foreign country must submit himself to the same laws as the natives. We do not permit this doctrine to be applied to our citizens living in barbarous countries like China, or Turkey, or Egypt. The reason we do not is, that we doubt the fairness of their judicial proceedings, and think their punishments from our point of view cruel and unusual. We submit our citizens to the law of civilized countries because ordinarily, if charged with offences, they will have a trial, and because, if convicted, they will be subjected to such penalties as we approve of and use ourselves. We certainly should not so submit them if they were exposed to imprisonment or other punishments without trial for an indefinite period. The difficulties the British Government will have in providing different treatment for the American suspects from that which they accord to the Irish suspects will undoubtedly be great, and undoubtedly the Irish-American agitators do not deserve it. But nevertheless we do not see how our Government can avoid asking for it. We cannot concede the liability of American citizens, living on foreign soil, to long terms of imprisonment without any investigation whatever, however much we may disapprove of the persons who raise the question.

THE OLDEST OF EMPERORS.

On March 22 William I., Emperor of Germany and King of Prussia, completed the eighty-fifth year of his life. His career is equally remarkable for its length and its striking historical features. He entered Paris as captain in the victorious German army in 1814 and again in 1815. In 1848, when the revolution had overpowered his brother, King Frederic William IV., he fled to England, covered with derision. In 1849 he commanded the army which was to give the *coup de grâce* to the revolution in Germany, escaped an attempt on his life, quelled the Baden insurrection, and by his rigor made himself an object of execration. In 1857, as the lieutenant of his mentally disabled brother, he inaugurated, amid general plaudits, the "new era" in Prussian politics. Crowned King in 1861, he proclaimed himself a ruler by right divine, was shot at by Oscar Becker, a democratic student, and, through Von Bismarck-Schönhausen, opened the period of "conflict" with the Parliament. This was ended by the armed conflict with Austria and South Germany in in 1866, and returning in triumph from the battle-field of Sadowa, he became the master of North Germany and the royal hero of the German nation. In 1870 he boldly took up the gauntlet thrown down to him by Napoleon III., invaded France, and sent her Emperor and her armies captives to Germany; and in 1871 had himself proclaimed Emperor of the united Fatherland at the château of Versailles, reduced Paris, dictated peace, and annexed Alsace-Lorraine to his empire.

It was not his own genius or sword which achieved these successes, unparalleled in all history, but he knew how to rely on Bismarck for diplomacy, and on Moltke for strategy, and he shared the toils and dangers of his armies, while his son and nephew stood at the heads of them. He was now the ruler of the most powerful empire on earth, and he meant to advance it on a path marked out by moderate Liberalism. Liberalism involved it in a struggle with Ultramontanism, not yet ended, and great moderation provoked new regicidal attempts. Hödel's bullets, in May, 1878, inflicted no harm, but Nobiling's shot nearly proved fatal, and caused acute pain and long illness. The Emperor bore his sufferings and perils with fortitude, and, after employing some rigorous measures, allowed his Chancellor to adopt a scheme of social reforms partly coinciding with the demands of the political camp from which the murderous assaults had emanated. When his nephew, Alexander II., fell a victim to the fanaticism of more relentless foes, William refused to resort to exceptional measures of precaution, declaring all such to be futile. In January, 1882, in an incipient new conflict with the Parliament, he emphatically asserted his right not only to reign but to govern. Firmness and vigor, in fact, characterize the whole of this remarkable career—qualities which new trials may possibly show in even brighter light, or ultimately baffle. This career may still be prolonged, and the teaching of the Athenian sage forbids us to declare it happy before it is ended.

Long reigns are rare in history, long royal lives much rarer still. Princes occupy one of the lowest levels in the whole range of longevity. The air of courts is destructive of health, nerve, and vigor. Lives which early corruption, luxurious and effeminate habits, unchecked passions, and unceasing excitement do not undermine, are frequently shortened by consuming ambition or care, warlike toil and peril, or the murderous hand of conspiracy. Among the remarkably long reigns in history are those of Uzziah of Judah (fifty-two years), Mithridates of Pontus (fifty-seven), Sapor II. of Persia (seventy-one), Alfonso I. of Portugal (seventy-three), Frederic III. of Germany (fifty-three), Christian IV. of Denmark (sixty), Louis XIV. of France (seventy-two), George III. of England (fifty-nine), Ferdinand IV. of Naples (sixty-five), and Pedro II. of Brazil (fifty-one till now). But Uzziah was a youth when he was placed on the throne, Mithridates a boy, Sapor a newborn babe, Alfonso an infant, Christian eleven years old, Louis four, Ferdinand nine, and Pedro five; and of all the monarchs mentioned only George III. reached the age of fourscore. Poland had one King who lived to the age of eighty-eight, Stanislas Leszczynski; but he reigned only five years, and survived his throne fifty-six years, living in quiet retirement. We must go back to the days of antiquity to find William I.'s royal peers in age, and the only ones we discover are Hiero II. of Syracuse, and Masinissa of Numidia, both of whom ended their reign at the age of about ninety. The reign of Rameses II., Pharaoh of Egypt—the Sesostris of the Greeks—is believed by some Egyptologists to have lasted about sixty-seven years, and his life about one hundred, but others reduce both his reign and his days to normal proportions. Thus no emperor known to history, no reigning king in Christendom, ever reached the age of William I. Our age boasts of this extraordinary royal life, as it does of the only Pontificate, that of Pius IX., which exceeded the term of St. Peter. And Berlin, which still often sees its Emperor-King on horseback, also saw in 1859 Alexander von Humboldt give the last touches to his "Kosmos" in his ninetieth year; Raumer, in 1873, officiate as professor

in his ninety-second; Field-Marshal Wrangel, in 1877, walk its streets in his ninety-fourth; and Ranke, in 1881, issue the first part of a universal history intended to embrace eighteen volumes, in his eighty-sixth. Moltke, who is not yet eighty-two, must thus appear to the German capital and nation as a man still available for action for many a year to come.

THE ENGLISH RADICALS AND THE ROYAL MARRIAGES

It was very awkward for Mr. Fawcett, Sir Charles Dilke, and Mr. Chamberlain that another royal marriage should have been projected during their term of office, for they all voted against the last grant made by way of a marriage portion to the Duke of Connaught, on his marriage in 1879 to the Princess Louise Marguerite of Prussia. Accordingly, they were obliged the other day, when provision was proposed, at the Queen's request, for Prince Leopold on his marriage with another German princess, to walk out of the House on the division. Consistency, if not principle, forbade their voting for it, and their place as Cabinet Ministers forbade their voting against it. Whatever arguments were used against the grants in the former cases, certainly retain all their force in this case, for Prince Leopold seems to be better fitted than any of his family for a single and retired life. He is a man of a studious turn and very delicate health. The scene in the Commons was made more awkward by some of the Radicals, including of course Mr. Bright, refusing to take off their hats, according to custom, while the Queen's message asking for the grant was being read.

The question, what is to be done in this matter, is a very serious one for the Liberals, and likely to become more so. There was no large royal family in England after the expulsion of the Stuarts until George the Third. Queen Anne's numerous children died in infancy. The monarchy was thus saved the very serious strain which a large number of princes and princesses always puts on people's loyalty, except, perhaps, in Prussia, where they are made to work hard and it is fashionable to be poor and live simply. The position of princes is difficult everywhere, and it is unusually difficult in England, where they have nothing to do, and are exposed from their infancy to the adulation and temptations of a very wealthy society. George the Third had a large family of boys, whose vices and debts were the great scandal of English life at the close of the last century, and at times almost put the monarchy in peril. Luckily, they had but few children. George the Fourth's only child died soon after her marriage. The Duke of Kent's only child was the present Queen. The Duke of Cumberland succeeded to the throne of Hanover, and transferred himself to that kingdom with his family. The Duke of Clarence (William IV.) had none, and neither had the Duke of York. The Duke of Cambridge had three, one of whom—the present Duke—has never married. One daughter has gone to Germany as Grand Duchess of Mecklenburg-Strelitz, and another has become the Princess of Teck, and lives on very small means in England, and has several children. In one way or another, when the present Queen came to the throne the royal family had been greatly diminished. Its objectionable members were all dead, and she was left a clear field for the work, which she has so happily performed, of presenting royalty to the people in an aspect which it had not worn for a century—that of a pure, decorous, and highly respectable institution, which the British father could exhibit to his wife and daughters without a blush, and which did not, considering everything, cost very much.

Within the last twenty years, however, the old difficulty of a great number of princesses and princes who have to be supported in idleness, in the midst of a most luxurious society, has arisen again. The Queen has had eight children, all of whom have had to be provided for by Parliament on their marriage, and only two of whom have settled in foreign countries and thus cut their descendants off from any further claims on the British Treasury. She has, moreover, ten grandchildren resident and to be resident in England, not to speak of the four children of the Princess of Teck, who are not likely to follow any calling, and have no property, or next to none. It is indeed a moderate estimate to say that ten years hence the British nation will have close on forty members of the royal family to provide for in some way, and they must be provided for with a certain liberality, on pain of seeing royalty cheapened or degraded by the spectacle of persons of the royal blood leading a shabby existence in the midst of the wealthiest society in the world.

Parliament has not shown much disposition to do anything very handsome for the Queen's children since the marriage of the Prince of Wales and of the Princess Royal, and the disposition to be stingy grows. The refusal of some Cabinet Ministers to vote on the grant to Prince Leopold shows how far the disinclination to be liberal in this matter has now gone. It is safe to say it is likely to go further. In spite of the popularity of the Queen, the dislike of the voters in the towns to donations of money to idle people steadily grows, and it promises between now and the end of the century to raise some very embarrassing questions, on which London and the provinces are likely to be even more divided in sentiment than they now are. London society, which is idle, rich, and luxurious, and gets a great deal of its excitement out of the doings of the court circle, thinks the money given to royal personages well spent. The provinces, which are serious, industrious, and increasingly commercial in their spirit, and see little of the royal family, have a growing dislike of giving money to fine ladies and gentlemen; and the Prince of Wales, though very popular, does little to combat this feeling by the nature of his occupations, or by the company he keeps. In old times it was comparatively easy to avoid these troubles by quartering royal personages on the Army and the pension list. But the pension list is gone. All, or nearly all, the sinecures which royal personages could take have disappeared. The reformer, too, has laid hold of the Army, and it will not be possible to maintain, after the Duke of Cambridge's disappearance, the old theory which made it in a special sense the property of the Crown, and gave the "Horse Guards" a sort of quasi-independence of Parliamentary control. The Duke of Connaught works hard as a military officer, but none of the Queen's sons has displayed enough ability to enable a Minister to put him in any high place as the man best fitted to fill it. A batch of her grandsons, too, are now coming forward, who will still further complicate the problem with which the sons are contending.

The effect of the multiplicity of princes on the popular respect for royalty has yet to be seen, but there is no question that it must suffer unless upheld by larger endowments than seem at all likely to be forthcoming. Strong as is the respect of the English people for royalty, there is something for which their respect is still stronger, and that is money. There is no country in the world in which "a poor gentleman" is held in so little respect; and the free circulation of a body of poor princes would be something which the British Constitution makes no provision for, and would have difficulty in bearing, even if they were men of clean lives, paid their debts, and did not sponge on their friends. In fact, complaints about royal sponging already begin to be heard among the aristocracy, which is not so rich as it used to be, and does not enjoy long royal visits. It is here probably that the weakest side of constitutional monarchy during the next fifty years will be found.

LONGFELLOW'S POETRY.

It is nearly forty years since Margaret Fuller, writing in the New York *Tribune*, startled the proprieties of Boston by some sharp criticisms on Longfellow and Lowell, then in the first flush of their fame. She declared Lowell's early poems to be crude and imitative, and those of Longfellow to be, in a great degree, "exotic." Each poet met the charge in his own way—Lowell with brilliant sarcasm, and Longfellow with good-natured indifference. Public sympathy went with them; but we can now see, at this distance of scene, how each profited by these criticisms. Lowell dropped from his collected works the greater part of his early poems, and Longfellow soon achieved his greatest successes by boldly drawing strength from his own soil.

In justice to Margaret Fuller it must be remembered that she was one of the first to recognize the pure and elevating tone of Longfellow's verse, and to defend him cordially from the charge of plagiarism, as brought in those days by Poe and others. But she pointed out, with some truth, that it was at first his tendency to offer us, as she pointedly phrased it, "flowers of all climes, and wild flowers of none"; that in the pretty prelude to "Voices of the Night," for instance, which all schoolgirls were then reciting, he sought the woods at "Pentecost" and found "bishop's-caps," when both of these words came really out of books, and did not habitually pass current on any New England hillside. She also said, with perfect truth, that in the "Spanish Student"—then his only long poem—the execution was to a certain extent "academical"; and she instanced as works of far more promise on his part such short poems as "The Village Blacksmith" and "To the Driving Cloud," which she considered to be, so to speak, indigenous. These criticisms

were expressed somewhat abruptly, no doubt, for tact, which has been called the virtue of cowards, certainly was not Miss Fuller's prime merit; but it will always remain doubtful whether, without them, we should have had "Evangeline" and "Hiawatha."

It is impossible to say, at this distance of time, how much of Longfellow's poetic change of base was due to criticism and how much to inward development. It is to be noticed that he had already published a few other poems essentially American in *motif* besides those Miss Fuller mentioned; among which should especially be named the "Skeleton in Armor" and the "Wreck of the Hesperus." It is at any rate certain that from this time he dwelt more and more upon these home themes which he had been accused of discarding, so that he soon became as essentially national in his poetic spirit as Emerson or Whittier. It is now clear that his great successes, his signal triumphs, were won by throwing himself wholly upon cis-Atlantic themes in "Evangeline" and "Hiawatha." The visible public response must have confirmed this tendency. There is in Allibone a table of the complete sales of each of his books up to 1857. It appears from this that of 'Hiawatha' fifty thousand copies were sold in two years, while of 'Voices of the Night' only forty-three thousand copies had been sold in eighteen years; and no other of his books had obtained a circulation as large as either. Of 'Evangeline' thirty-seven thousand copies had been sold in ten years, while of the 'Golden Legend' only seventeen thousand copies had been sold in six years, and of 'Hyperion' only fourteen thousand in eighteen years. For any other poet the least of these figures would, no doubt, be a good showing; nevertheless there is much to be learned by this comparison of statistics. The test of foreign popularity was even more conclusive. 'Evangeline' has been translated six times into German, thrice into Swedish, thrice into French, twice into Italian, besides Danish, Spanish, Portuguese, and Polish versions—making eighteen translations in eight languages. 'Hiawatha' has been rendered four times in German, besides versions in French, Italian, Swedish, Danish, Dutch, Polish, and Latin—eleven translations in ten languages. 'The Golden Legend' has been translated into four languages; 'Miles Standish' into three; 'The Spanish Student' into two—the Spanish not being one of these. It would be impossible to have more conclusive evidence that a national flavor gives a supreme advantage, at home and abroad, in respect to popularity; and it is impossible not to suspect that Mr. Longfellow might have gone on writing 'Spanish Students' to the end of his life—had such a thing been possible—without securing the fame given him by a newer theme. Popularity is of course but one of the tests to be applied, yet on the career of an author like Longfellow, who never seeks inexplicable depths or dim altitudes, it has an important bearing. In his case, at least, popularity at home and abroad was largely increased by a more marked national tone. It was not enough for him to be a poet of the human heart and conscience: the special soil on which he grew had something to yield him.

But in becoming, like Whittier, a national poet, Longfellow's execution remained as unlike Whittier's as before. The calm and imaginative treatment of the "Poems on Slavery"—valuable and even powerful as it was—was different in kind from the Tyrtæus-like strains which Whittier had sent forth. Lowell's first anti-slavery poetry had so resembled Whittier's that when his "Verses Suggested by the Present Crisis" appeared anonymously, every one supposed them to come from the elder bard. Longfellow's poems had absolutely nothing in them that could suggest any such resemblance, apart from the theme; yet they brought aid to the anti-slavery movement from a source that weighed far more with conservative circles than did those of the other two, both of whom were then quite out of favor with good society. On the other hand, it unfortunately happened, for some cause easy to conjecture, that in the first illustrated edition of Longfellow's poems, published by Cary & Hart in Philadelphia, in 1845, these anti-slavery verses were omitted; and this inevitably led to some unkind criticism, which was not allayed by the fact that they were included in a complete cheap edition published in Cambridge about the same time. Still, these poems had their undoubted influence on the times, and Mr. Longfellow's faithful intimacy with Charles Sumner left his own position clear. He was thenceforth well understood to bear the same sort of relation to Whittier and Lowell that Dr. Channing bore to Garrison: to have a temperament less aggressive, but principles equally firm.

In comparing his American ballads also with those of Whittier the reader is struck by a corresponding difference. In both cases the chosen themes might be cis-Atlantic, but in Longfellow's treatment the enveloping atmosphere had almost always a slight and not unpleasing foreignness; very much as George Fuller throws about his American figures something of the same encircling haze that charms us in the peasant-pictures of the French Millet. Whittier was also more literal; he was almost always true to his legend, except where, as in the case of his "Amy Wentworth," he manufactured it outright; while Longfellow, as in his "Lady Wentworth," took the historical fact and transformed it very considerably for dramatic effect.

After all, each writer must work after his kind; and, as the Italians call Vandyck "il pittore cavalleresco"—the quality being imputed to the painter, not to the sitters—so it is impossible that Longfellow should not be a poet of the picturesque and even of the chivalrous, wherever he may choose his themes. This makes a difference between his and the Quaker hand, though their subjects be never so similar; and then Longfellow's perfect execution—so far beyond Whittier's—gives to his best local and legendary poems, as in the case of "Paul Revere's Ride," an excellence beyond all competitors.

Yet it is inevitable that precisely this admirable execution should have led to some criticisms which a cloudier or clumsier poet would have escaped. It is this quality which is chiefly responsible for the discussions which have always taken place, and will now doubtless be renewed, as to his rank among poets. Whatever we miss in Longfellow, we never miss the perfection of crystallization. Now this is a thing that all enjoy for the moment, but all do not praise afterward. We like what is easily understood, but there is also an enjoyment of what is difficult to comprehend. There may be a mere pride in the unintelligible, just as the possessor of an autograph letter from Rufus Choate or Horace Greeley dwells with pride on the fact that nobody can make out a line of it. Then there is something more to be taken into account. That tempting phrase of Coleridge's has much to answer for—"the kind of obscurity which is a compliment to the reader." Coleridge himself certainly flattered his readers pretty profusely, if this be the standard, while Longfellow, though he wrote from Coleridge's own inkstand, drew from it no such ink. There is undoubtedly a profound delight in poems like many in Browning's 'Men and Women,' which seem to be inexhaustible in what they yield to you, because they yield very slowly. They are like the fountain called "La Roche qui pleure" at Fontainebleau, which gives the thirsty traveller only a drop at a time, but you can always go back to it and be sure of another drop. Shall we, therefore, do injustice to Longfellow's ever-fresh and ever-living spring? As we turn the leaves of his books each page tells an experience, utters an emotion, or affords a thought; each page, like each day in the life of his "village blacksmith," offers "something attempted, something done." If you say that, after all, the very ease of the execution shows that the work is not difficult to do, the answer is obvious, why does not some one else do it? After all, poetry has two factors—the thought or emotion and the expression—and the success lies in the just combination of the two. Grant that we or our cousins and friends get up every morning with thoughts profounder than any of Longfellow's, it does the world no good unless we express them. Take the poets we proclaim as greater than Longfellow—Browning, for instance, or Emerson—and how often they fail to express their thoughts so that anybody can enjoy them without a course of lessons from an experienced professor! If we admit as true for poets what Ruskin says of painters, that "it is in the perfection and precision of the instantaneous line that the claim to immortality is made," we must say that no American up to this time has built his fame on surer grounds than Longfellow.

And, after all, while the great loss is fresh upon us, one has not the heart to analyze the gradations of merit. It is enough to know that the historic house to which so many eyes have turned for half a century is henceforth but a vacant socket, with its light gone out; that the generous hand which never moved but to bless others is now forever still. So many books, so many songs, so many themes for song; and yet now the accumulated resources of the human race are powerless to obtain for us another verse from Longfellow! Last Sunday afternoon the snows fell thick across the meadows which the poet described so vividly in his "Afternoon in February":

> "The snow recommences;
> The buried fences
> Mark no longer
> The road o'er the plain,
> While through the meadows,
> Like fearful shadows,
> Slowly passes
> A funeral train."

But this time the train that passed was the poet's own funeral, and there was no one to set its mournful requiem to music. Let us be glad that, in these days of doubt and uncertainty, there was one man for whom death had no real gloom, and who could look forward with absolute confidence to meeting those whom he had loved clothed in new angelhood, within their Father's House.

ADMINISTRATION OF THE CITY OF BERLIN.—II.

THE municipal assembly (*Stadtverordneten-Versammlung*) is the body which corresponds to a State legislature. It consists in Berlin of 108 members, which can hardly be considered too large a number to represent a city which is as large as some States. For purposes of election, the city is divided into districts (*Wahlbezirke*). Each class elects one-third of the representatives. The representatives are elected for six years, the term of one-third expiring every two years. At the end of the second and fourth years after the adoption of the Städteordnung it was determined by lot who should retire. Two-thirds of the representatives are thus always experienced men. They receive no pay—this is an important point—as their office is one of honor (*Ehrenamt*). One-half of the number of representatives must possess houses (those who enjoy the usufruct of a house, *Niessbraucher*, are considered house-possessors). Neither father and son nor brothers are allowed to be members of

the city council or assembly at the same time. The assembly meets every Thursday afternoon in the city hall (*Rathhaus*). Its meetings are public.

The magistracy is the executive branch of the city government. It is a collegiate body consisting of thirty-four members, one-half of whom are paid. Father and son, father-in-law and son-in-law, brothers and brothers-in-law, may not be members of the magistracy at the same time. At the head of the college of magistrates stand the *Oberbürgermeister* (chief-mayor) and *Bürgermeister* (mayor). The mayor and paid magistrates, whose whole time is consumed by their duties, are elected by the municipal assembly for twelve years, and have a right to a pension in case they are not reëlected. The other members of the magistracy are elected for six years, one-half of them retiring at the expiration of each three years. The members of the magistracy must be confirmed by the King or some branch of the state government. In the college of magistrates and in the assembly the majority rules.

The functions of the municipal assembly resemble those of an ordinary legislative body. They discuss all matters pertaining to the administration of the city, but are not allowed to execute their resolutions. The magistracy must do this, or, if it refuses—as it must in case the resolutions are illegal, transcend the competency of the assembly, or are calculated to do injury to the state or public welfare—it is obliged to transmit the reasons for its refusal to this assembly. If, even after a commission consisting of representatives of both bodies has considered the matter, no amicable adjustment can be reached, the matter is laid before some branch of the state government. The practical result is that this government, taking upon itself to decide, performs duties which really belong to the city authorities, or, as has frequently happened in Berlin, nothing is done. To take an example: If, assembly and magistracy should both agree as to the expediency of establishing a new hospital, but could not come to an understanding about its location, the project would undoubtedly rest until some change in one or both bodies enabled an agreement to be reached. The assembly has the advantage in the long run, as it elects the members of the magistracy, and has that powerful weapon of legislative bodies in constitutional countries—the right of making the appropriations, or budget-right, as it is called.

The assembly controls the entire administration of the city. It can demand that the acts of the magistrates and all accounts be submitted to it, or to committees appointed by it. The assembly watches over city property, and determines its use. Real estate belonging to the city can be disposed of only with the sanction of the general Government. The same thing holds with objects which have a special scientific, historical, or artistic value. It is also necessary to obtain this sanction to raise a loan which shall increase the debt of the city.

The higher city officers in Berlin, as elsewhere in Prussia, must be appointed for life. Employees may be engaged temporarily to render services which are not permanently required. The city has also the right to employ subordinate officers whose duties are merely mechanical, with the understanding that they may be discharged after due notice. The magistracy appoints, and the assembly confirms. As everywhere in Prussia, special fitness is considered in making appointments, and is determined by examination or otherwise. The mayor himself must have graduated in law from a German university. A trial precedes permanent appointment; in some cases this lasts for three years.

Whatever evils may be connected with a permanent civil service, it would seem a better device for getting rid of "rings" than the one which so many American cities appear disposed to try—namely, that of making the mayor absolute. We have already many forms of despotism in this country which would not be tolerated in Russia. These life-appointees are honest and perform their duties faithfully. The writer cannot think at this moment of a case of official dishonesty in Berlin. Mr. Kasson, in his report to Mr. Evarts, printed in the "Foreign Relations" of 1879, said of Vienna, where a similar system of appointment exists: "The bürgermeister stated to me that there is no record of any embezzlement or pecuniary fraud as *ever* having occurred among the life-appointees." Under such a system of civil service, it is not for the interest of an officeholder to be dishonest: as means are provided for punishing, and even dismissing, officers who do not discharge their duty in every respect; and as advancement depends upon efficiency more than anything else, an officeholder's future is ruined by dishonesty or neglect of duty. Then there is among the educated Prussian civil-service officers an *esprit de corps* which holds them to a high sense of official honor.

Still another advantage of this method of making appointments is that it is cheaper. Political economy teaches that one element in determining wages is risk incurred, either of bodily harm or of being out of employment for some time. Wages must contain an insurance premium in dangerous employments. This is high in cases where one's future is so uncertain as is that of every civil-service officer in the United States. On the other hand, where the civil service offers an honorable social career and permanent employment to meritorious officers, city or state government is able to obtain a sufficient number of qualified employees at low wages. Probably the salaries paid in Berlin are often less than those obtained by clerks in mercantile houses in the same city rendering similar services. The greater security of employment and the honor of the position are compensation for lower wages. The highest salary paid in the bureaus and city treasury is $1,500 (6,000 marks), and there are only three appointees who receive so much. Three places yield salaries of $1,425, three of $1,350, five of $1,275, etc. These salaries are the highest given to those holding the places. Beginners do not receive so high salaries, inasmuch as salaries advance with long and faithful service, as Secretary Sherman wished that they might in the United States Treasury Department. Three hundred and sixty-four secretaries and assistants of the magistracy receive from $450 to $1,100; yet these are mostly educated, cultured men, with whom it is a pleasure to come in contact socially. The Oberbürgermeister receives only $6,000, although, as the chief executive of a great city numbering over one million inhabitants, his place is very properly considered one of the most honorable official positions in Germany. The present Oberbürgermeister, Herr von Forckenbeck, is a distinguished German, altogether apart from his present position. He has been member of both branches of the Prussian legislature, and member and President of the Imperial Parliament (Reichstag). He was one of the founders first of the Progressist, then of the National-Liberal party. He was formerly Oberbürgermeister of Breslau. He was called from Breslau to Berlin, as the municipal assembly is not confined to the Berlinese in its choice of a mayor. The Oberbürgermeister is selected very carefully. The place seeks the man, rather than the man the place; in some cases he is able to make conditions with the Government. A recent Oberbürgermeister would not accept his position until the Prussian Government had, in accordance with the wishes of the municipal assembly, promised greater liberty of self-government to Berlin. The very considerable independence of Berlin is seen in the fact that the magistrates and the members of the assembly very generally belong to parties which are politically quite radical. Bismarck, in particular, has no affection for them.

In reading the report of the magistracy, it becomes evident that there is a considerable advantage in a certain permanence and steadiness of policy on the part of the municipal government. Plans are laid for a long series of years, and carried out gradually as the city can afford the expense. Berlin has recently adopted an improved plan for disposing of its sewerage—that known as the irrigation system, the sewerage being allowed to flow over large fields in the vicinity and fertilize them. The plan was at first tried for a part of the city only, and has been gradually extended, as it has proved thoroughly satisfactory. The completion of the work will still require several years, in order to avoid a too great financial burden. "Without haste, without rest," seems to be the motto of the municipal government.

But the most interesting question to the taxpayer is, What does it cost in Berlin to provide free schools, clean the streets, keep up the parks—in short, to perform all the functions of a municipal government? We will devote the remainder of this paper to answering this question. The report of the magistracy gives the net receipts and net expenses of the municipal administration. In giving account of the gas-works, for example, only the surplus of receipts over expenditures is given. In giving the expenditures of a department, its receipts are subtracted. This is not entirely satisfactory. We should like to know not only the net receipts of various departments (particularly of taxation), but also the entire receipts, in order that we might estimate the expenses of collecting them. However, judging from comparisons he has made, the writer is able to say that from five to eight millions of marks should be added to net receipts and net expenditures to obtain the sum-total of expenses and receipts. The following table gives the net receipts and expenditures of the government of the city from 1861–1876, and the amount yielded by taxation toward defraying the expenses of the administration, the remainder being provided for out of surplus of city gas-works, city property, etc., except in so far as debt was incurred:

	Net receipts.	Net receipts from taxes.	Net expenditures.
	Marks.	Marks.	Marks.
1861	6,578,162	6,364,035	6,060,511
1862	6,964,376	6,787,966	7,392,270
1863	8,174,100	7,394,048	8,621,501
1864	9,445,635	8,002,424	9,659,621
1865	8,975,072	8,188,964	9,338,822
1866	12,723,100	8,207,233	11,128,610
1867	11,491,961	8,655,752	11,270,770
1868	11,749,287	9,468,805	11,800,165
1869	12,520,646	9,993,136	11,197,502
1870	14,750,972	11,042,350	16,457,430
1871	17,272,267	13,708,580	15,652,304
1872	20,255,671	16,413,852	19,854,966
1873	22,840,015	19,876,235	23,507,735
1874	26,313,253	22,122,878	25,990,107
1875	24,399,970	20,948,113	25,072,806
1876	26,510,697	19,965,367	26,938,599

The differences between total and net expenses may be seen from the fact that the former were 34,740,245 marks in 1876. According to the budget, from April 1, 1879, to April 1, 1880, the total expenses for the year were estimated at 42,376,705 marks; the total receipts were placed at the same figure.*

* It is interesting to note that the net expenses of the municipal administration this year were nearly the same as the interest on the city debt of New York for 1881, which was $8,240,965 45, according to the final estimate.

The report calls attention, with particular satisfaction, to the accounts of expenditures for schools and the support of the poor, as characteristic of the spirit of the entire administration of the city. The magistrates are proud of the fact that in 1876 26 per centum of the sum at their disposal, consisting of net receipts and the balance on hand from the preceding year, was used for educational purposes, while in 1861 only 9.74 per centum of the sum at their disposal was so expended. We will not at present enter into a discussion of the question whether it is wiser on the part of the authorities to endeavor in every way to increase the appropriations for schools, and to pursue this policy systematically, or to begin the work of reform and economy by cutting down the meagre salaries of public-school teachers whenever the public become incensed at the extravagance of the municipal government. The magistrates and representatives in the municipal assembly of Berlin have, however, considered it expedient to economize by so organizing the administration of public charity as not to encourage vicious idleness and unworthiness. The whole city is divided into 157 districts, in each of which there is a poor-commission, consisting of worthy and respectable citizens, which assists in the relief of the poor. The result is, that while in 1861 no other branch of the municipal government required so large a percentage of the revenues at the disposal of the city authorities, in 1876 it required little over half as much as the schools. The percentage for the care of the poor in 1861 was 18.13; in 1876, 14.19.

Perhaps no part of the city administration reflects more credit upon the municipal authorities than the management of the city debt. The expenses on account of this debt, including interest, and in each case a considerable payment toward extinguishing it, were 4.48 per centum of receipts in 1861; in 1876, 3.91. No great debt is allowed to accumulate. A burden is shifted from the present to the future only when it seems right that the future should bear it. A case occurred where the rapid increase in the size of the city made it necessary to build a large number of school-houses at one time. As these would benefit the future as well as the present, it was considered right that the future should bear part of the burden. The same policy has been pursued in the case of the new system of sewerage. In both cases it would otherwise have been necessary to postpone needed improvements for a number of years. The total debt at the close of 1876 was less than $6,000,000, which cannot be considered a bad showing for a city as large and wealthy as Berlin.*

It is impossible not to admire the zeal, economy, and intelligence with which Berlin is governed. If it were possible to take up each branch of the city government and examine it in detail, this would become still more evident. It is, however, impossible to do so within the limits of an article of this character. The writer can, in conclusion, only hope that some of his readers may be induced to examine the most admirable report of the Berlin magistracy for the years 1861–1876. The study of this report, together with some work on Prussian municipal law like Von Möller's "Preussisches Stadtrecht" (Breslau, 1874), could not fail to benefit those to whom the government of any large city has been committed.

* The total funded debt of New York, July 31, 1881, was $135,100,907 07. Subtracting the amount in the Sinking Fund, the net funded debt, on December 30, 1881, was $98,302,854 18.

THE ALIENATION OF RUSSIA FROM FRANCE.

PARIS, March 3, 1882.

THE House of Austria has long been the chief enemy of France. It was also the enemy of all the free countries of Europe. Under Philip II. it represented a principle which, if it had triumphed permanently, would have put an end to all civilization. It was a fundamental principle for all the representatives of France to look everywhere for allies against Austria. They tried in turn the Dukes of Savoy, the Netherlands, England, the Swiss cantons, Venice, the Turks, the Swedes. Henri IV. was assassinated at the very moment when he intended to begin a great struggle against Spain and Austria. His "great design" remained among his legacies to his country, with the noble principle of religious tolerance. Richelieu made an alliance with Gustavus Adolphus, and opposed him to Tilly and Wallenstein. Under Louis XIV. France was obliged to employ Turkish arms against Austria; Poland was also a sort of ally, but a fickle and uncertain one.

A new power was forming in the seventeenth century. It emerged, so to speak, from the atomic and unorganized state; and it was soon clear that Russia, appearing on the stage of European politics, might some day play in the combinations of war and of diplomacy the part which had been long assigned to Sweden, to Poland, and to Turkey. Sweden, thanks to the genius of her leaders, had taken a part which was out of proportion to her real strength; but she could not play it for ever. Poland was weakened by the most absurd political organization, and was at times absolutely impotent. Turkey's long decadence was already beginning; she could still strike heavy blows, she could spread terror in the valley of the Danube, but she could not do much more than inflict useless misfortunes on all her neighbors. The Grand Duchy of Muscovy had become Russia; Peter the Great had made his country a European power, and told the French that Russia could take the place of Sweden. What was France to do with regard to this ambitious young empire? The union of France with Sweden, with Poland, and with Turkey had become one of the maxims of French politics—it was a sort of religion; and it was evident that Russia could only elbow herself out of her old provinces at the expense of Sweden, Poland, and Turkey. Were we to abandon our traditional allies in favor of a new ally, to leave the certain for the uncertain, the known for the unknown? Was it not better to take advantage of the difficulties of our allies, to keep them united under the protection of France, and to oppose them as a strong barrier, not only against the encroachments of Austria, but against the ambition of the new semi-Asiatic empire? If France had boldly and systematically adopted either one or other of these two policies, she would probably have been benefited in either case. But she wavered between the two systems; she vacillated between her old allies and Russia.

We are only now beginning to study in all its details the French diplomacy of the eighteenth century. The Duc de Broglie has given us some very interesting details in his 'Secret du Roi,' and recently he has analyzed with much talent the incidents which accompanied the beginning of the Seven Years' War in a series of articles in the *Revue des Deux Mondes*, which will soon be republished in a volume. M. Albert Vandal has just written an interesting volume on 'Louis XV. et Elisabeth de Russie,' a study of the relations of France and Russia in the eighteenth century, composed with the aid of documents in the archives of our Foreign Office. When Peter the Great made his visit to the Court of the Regent, he was, says Saint-Simon, animated with an extreme desire to unite himself to us. The Regent, who had a very unprejudiced mind, had already ordered M. de Châteauneuf to open negotiations with Peter, when he received a very curious letter from Dubois, warning him against the dangers of the Russian alliance, and assuring him that he would certainly lose England and Holland, and therefore all the fruits of the triple alliance which he had concluded. "The Czar and the King of Prussia pass for very untrustworthy princes. . . . I cannot but remind you of two Italian proverbs. One is: *Chi sta bene non si muova.* The other is the epitaph of a man who had killed himself with precautionary remedies: *Per star meglio son qui.*" The Regent finally refused to conclude an effective alliance with Peter. The Czar's visit was otherwise a great success: he became a lion; his simplicity, his disdain for all comfort, all luxury, his ardor for mechanical objects, amused the court, but he went away without having accomplished anything, and without having persuaded the King's ministers that he might be the new Gustavus Adolphus.

After the death of Peter, his widow Catherine, deceived in the hopes which she had first had on the French side, turned toward Austria and established intimate relations with that empire. The idea of a French alliance was abandoned, and it only revived in the head of Elizabeth, the daughter of Peter the Great. This idea took a very poetic form: Elizabeth fell in love at a distance with the young King of France, Louis XV.

"Toward the middle of his reign," says M. Albert Vandal, "Louis XV. appears as the perfect type of royal beauty, mixed of greatness, grace, calm, and majesty. The glory of his father surrounded him with a brilliant halo, and fortune seemed to accompany his steps. He had known success without having known effort. A happy war rapidly brought to an end and well-conducted negotiations had marked his beginnings, and victory had crowned him with laurels which had not been too dearly paid for. The fatigue of happiness, though casting on his face a shade of disdainful lassitude, still added something to the distinction of his noble visage. For a little while, France was in love with her King, and Europe partook of this passion."

When the question of the King's marriage arose, Russia offered the hand of the Grand-Duchess Elizabeth. She was young, ardent, romantic. A portrait of Louis XV. being given to her, she fell in love with it, and seems never to have forgotten this first movement of attraction. She always kept a place in her heart for this affection, although she afterward spent her life in incessant intrigues. The French Ambassador in Russia was M. de Campredon; he favored ardently the Russian marriage, and showed the political advantage of it in his despatches. The King of France had to choose from a list of seventeen princesses, carefully prepared by the Foreign Office. The first in rank was the daughter of the Prince of Wales, but England could not consent to her becoming a Catholic, and this idea had to be abandoned. Louis XV. fell in love with a sister of the Duc de Bourbon, Mademoiselle de Sens—young and remarkably handsome. The Duke sent her to a convent, and when the young King complained of this severity, "My sister," said the Duke, "is not of a rank to be a mistress." The King said that he would make her his wife. Prince Kurakin, the Russian Ambassador in Paris, wrote all these details to his Court, and the position of M. de Campredon became somewhat difficult, as it was evident that Louis XV. was more accessible to passion than to preoccupations of a general interest.

The Duc de Bourbon finally chose Maria Lesz-

czynska, the daughter of the ex-King of Poland, Stanislas. She was modest, unobtrusive, without any ambition, pious. The marriage, as regarded Russia, was a blunder. The Empress of Russia could not well forgive the King of France for having preferred to the daughter of Peter the Great the daughter of a dethroned king of Poland. Catherine soon afterward entered into a close alliance with Austria; a treaty was signed at Vienna on the 25th of August, 1726, for the period of thirty years. It was a treaty of offensive and defensive alliance against Turkey, defensive only with regard to all other states. This act was one of the most important diplomatic events of the eighteenth century; it paved the way for the partial Germanization of the Muscovite Empire, and began the continuous invasion of Russia by German administrators, engineers, generals. When Russia afterward appeared for the first time on the battle-fields of central Europe, she merely played the part of a reserve of Austria.

Nothing can be more dramatic than the history of the mission of M. de la Chétardie, the Special Ambassador of France, who was the principal actor in the great *coup d'état* which placed Elizabeth on the throne. Almost on the very day when the Czarina Anna died (1740), leaving the crown to her nephew Ivan of Brunswick, a child fourteen months old, the Emperor Charles VI. died in Vienna. All Europe was thrown into confusion. Charles VI. had no male heir. Could his daughter Maria Theresa take the reins of the Empire in her own hands? Frederic II. boldly entered Silesia and took possession of it. What were France and Russia to do? Both had recognized the Pragmatic Sanction and the rights of Maria Theresa. If they stood by her, they saved Austria, they stood in the way of Prussia's ambition, and maintained the old equilibrium of Europe. If they stood by Frederic, they created a new balance of power in Europe.

France had been working for two hundred years against the house of Austria; but was Austria now weak enough? Old Cardinal Fleury wished to side with Austria, but the military youth of the court formed a party which has been admirably described by the Duc de Broglie. The young soldiers, the ladies, the philosophers, who were already becoming a power in the state, all went for Frederic. Attacked by Prussia and threatened by France, Maria Theresa asked for the help of Russia. La Chétardie resolved to place Elizabeth on the throne. He hated the Brunswickians as much as the Russians did themselves. The army, all the malcontents, had their eyes turned upon the daughter of Peter the Great. The history of this revolution is well known. La Chétardie played the principal part in it, after Elizabeth. She showed the greatest firmness and courage—went herself to the barracks. "Children," said she, "wake up! Our poor nation is under the yoke of the Germans. Let us get rid of our oppressors." How strange these words sound! how like the words pronounced the other day in Paris by Skobeleff!

After her triumph, one of the first thoughts of Elizabeth was for Louis XV. She immediately wrote to him, announcing the great event. The accession of Elizabeth to the alliance formed against Frederic in 1756 would have ruined the King of Prussia; but the policy of Louis XV. was vacillating. The history of its variations is well told in the interesting work of M. Albert Vandal. After the death of Elizabeth, the French policy became even more uncertain. Louis XVI. was thinking of an alliance with Russia when the convocation of the States-General interrupted all his plans. The revolution of 1789 threw Russia perforce among the enemies of France,

THE NATIONAL PARTY AND THE EGYPTIAN CONTROL.

CAIRO, February 27, 1882.

WITHOUT attempting to speculate upon the uncertain factors in the problem—such as the panislamic aspirations of the Sultan, the intrigues of Halim, and the hopes of Ismaïl—the events which have placed the National Party in power may be thus briefly stated. Just a year ago the troops comprising the garrison of Cairo beleaguered the Khedive in his palace, and did not return to their quarters until they had obtained what they demanded—to wit, the release and pardon of a colonel who was being tried by court-martial for a purely military offence. On the 9th of September, 1881, Ahmed Bey Arabi, and the insubordinate colonels of the preceding February, usurped the command of the Egyptian Army, and, with the irresistible argument of six batteries of Krupp guns, demanded (1) the dismissal of the Riaz Ministry, which had gained its reputation by a reform of the financial administration, (2) an increase of the strength and pay of the army, and (3) a Constitution. Arabi Bey frankly told the Khedive upon this occasion that unless he yielded to these demands a successor was ready to take his place. All that the colonels asked for was granted, except that an Assembly of Delegates was given them instead of a Constitution. Sherif Pasha—the successor of Riaz—ordered the elections to be at once proceeded with. The Delegates were chosen amidst the utmost tranquillity, not to say indifference, of the great masses of the people. The names presented by the Sheiks-el-Beled, or village mayors, were accepted without question, and nine out of ten fellaheen are to this day ignorant of even the name of the delegate who represents their district in the National Assembly. In January, the Assembly, composed of a single chamber of eighty delegates, was opened in person by the Khedive. The framing of the Organic Law defining the functions and limiting the powers of the Assembly caused a serious difference of opinion between the Sherif Ministry and the Assembly. The latter demanded the full control of the Budget, but promised not to disturb the arrangements for the payment of the Turkish Tribute and the Public Debt, which had been sanctioned by the Law of Liquidation, having the full force of a treaty obligation. The Sherif Ministry urged that the powers demanded by the Assembly infringed upon the functions of the Anglo-French Control as established by the Khedivial decree of November 15, 1879. Upon this issue Sherif Pasha resigned, and was replaced by Mahmud Pasha Samy (who had been War Minister under both Riaz and Sherif, and who had served as a cavalry officer during the late Turko-Russian war), and Ahmed Bey Arabi became the new Minister of War. A law was at once approved by the Ministry which gave the right to vote the Budget to a committee composed of Ministers and Delegates in equal numbers, the Assembly having the casting vote. This limited the sphere of action of the Controllers to that of mere cashiers. The British and French Consuls-General protested, and the Assembly replied to their protest by denying that the Powers had any right to interfere in matters concerning the interior development of the country. The issue is now framed. Riaz and Sherif have fallen, and, with the possible exception of Mahmud Pasha Samy, there is no longer any "buffer" between the Egyptian Assembly of Delegates, with the army at its back, and the Anglo-French Control, which virtually assumed the functions of an Anglo-French Protectorate. Either the Assembly or the Control must give way. The Army are ready to fight if necessary to support the position now maintained by the Assembly, and England and France cannot withdraw the Control without eating their own words, proclaimed with a flourish of trumpets in Lord Granville's despatch and in the Joint Note.

It should be observed that the Anglo-French Control—unlike the International Tribunals and various financial institutions—is not created by treaty, or by any strictly international obligation whatever, but is established by an ordinary Khedivial decree, which may at any moment be lawfully revoked at the Khedive's pleasure. The following is a translation of the decree concerning the powers of the Controllers-General:

"ARTICLE 1. The Controllers-General shall have in financial matters the most complete powers of investigation into all the public services, including those whose receipts have a special destination by virtue of decrees and contracts. Ministers and functionaries of every rank shall be bound to give every information and to furnish every document required by the Controllers and their agents. The Minister of Finance especially shall furnish the Control every week with a detailed statement of all receipts and expenditure at his Ministry. Every other Administration shall furnish similar statements every month.

"ART. 2. The Controllers shall agree upon the public services over which they shall each exercise the rights of supervision and control conferred by this decree.

"ART. 3. The Governments of France and Great Britain having consented, for the moment, that the Controllers shall take no part in the actual management of the Administration and financial services, the Controllers shall for the present confine themselves to the communication to us or to our Ministers of such observations as their investigations give rise to. They shall also communicate to the Commission of the Debt all facts of a nature to interest the creditors of the Consolidated Debt. They may also, on account of such facts, convene the Commissioners of the Public Debt to examine such questions as the Controllers or the Commissioners of Public Debt may think advisable to discuss in common.

"ART. 4. The Controllers shall have the rank of Ministers at the Council (of Ministers) and shall have a seat and a consultative voice there.

"ART. 5. At the end of each year, and more frequently if necessary, the Controllers shall communicate to us their work in a report which shall be published by them and inserted in the *Moniteur Egyptien*.

"ART. 6. The Controllers can only be removed from their posts with the consent of their respective Governments. They shall name their own officials and fix their salary.

"ART. 7. The expense of the Department of the Control shall be fixed by the Controllers and approved by the Ministers.

"ART. 8. The amount required by them shall be paid to them monthly.

"ART. 9. Our Ministers are charged with the execution of this decree.

"Signed: "MEHEMET TEWFIK.
"RIAZ PASHA.

"Nov. 15, 1879."

Whether Egyptians under parliamentary government may or may not, after all, furnish another instance of old wine in new bottles, depends upon a question that is very little considered by either the great Powers or by the National Party—to wit, public education. Of the 350,000 male children in Egypt, of school-going age, about 120,000 attend "schools," where education is limited to the learning by heart of a few rules of the Koran; only 2,000 receive instruction equivalent to that imparted in the primary schools in the United States; and scarcely 400 pupils receive what may be called higher instruction. These figures are exclusive of 8,000 pupils in private schools, established by Europeans and by the American missionaries in Cairo, Alexandria, and Siut, only fifty per cent. of whom are Egyptians; and the 7,000 students in the El Azhar (the great University of El Islam, where theology flourishes, and where natural science is cribbed and confined to meet the requirements of the dogmas of the Koran) are also excluded. The following significant facts show in what direction public instruction in Egypt is tending: dur-

ing the past seven years the total number of pupils in the Government schools has *diminished nine per cent.*, and during the same period the number of pupils in schools established by foreigners, and which have no connection whatever with the Egyptian Government, has *increased thirty-six per cent.* B.

ALEXANDRIA, March 7, 1882.

THINGS have been in suspense here for some time. The only news which has been passed on from one to another, in the lax sort of way in which news travels here, is that another change of Ministry is imminent, and that the Khedive is holding frequently-repeated consultations, now with the English and French Consuls-General and now with his chief Ministers in the new Cabinet.

The inclusion in the newly-settled Constitution of a clause under which the Budget is to be discussed by a committee of the Chamber of Notables and the Ministry, sitting together, is the main victory attained as yet by the last revolutionary move, which brought Colonel Arabi Bey to the presidency of the Ministry of War. The clause seems natural and, to the European or American mind, innocent enough in itself; and yet the whole question of the continuance of the European Control in its present form will probably be found involved in it. Those who are familiar with the history of Egypt for the last four years will remember that all the administrative improvements which have been achieved, and the constitutional victories which have been won, have been bound up with the readjustment of Egyptian finance. When it was found by the International Commission of Inquiry of 1878 that in his reign of fifteen years the Khedive, Ismaïl Pasha, had burdened his country with a debt of £90,000,000 sterling, with scarcely anything to show for it in the way of reproductive improvements, England and France were charged by the other Powers to make a resolute effort to save the country from bankruptcy, and to provide for the liquidation of the debt within a limited period. In the course of their report, the Commission had drawn attention to the administrative confusion which prevailed in all branches of the Government, and which involved the grossest oppression of the people. Corruption and extortion in collecting the taxes, forced labor perverted into slavery, a military conscription of an oppressive and grinding character, and the general denial or pollution of justice in the native courts, were some of the evils which the report laid bare. The Commissioners attributed all these evils to the uncontrolled absolutism which characterized the Government. The remedy was sought first of all in including a French and an English Minister in the Egyptian Cabinet, for the purpose of checking the Khedive and reconstituting the administration; and afterward, when the Khedive Ismaïl was recalcitrant and fostered a revolution in order to escape from his constitutional fetters, recourse was had to a new sovereign who should hold his throne by a strictly constitutional tenure, and whose Ministers should admit to their meetings for purposes of consultation an English and a French adviser, severally representing their own Governments.

It is this implication of the finances and the yearly Budget with the general administrative conditions of the country which renders the clause above adverted to in the new Constitution of such serious import. The English and French Controllers, MM. de Blignières and Colvin, have already publicly protested, in a document dated from Cairo, the 6th of February, which has appeared in the leading French and English newspapers. In this document they say:

"When the Decrees regulating the powers of the Controllers were promulgated, the real power belonged to the Khedive, and by delegation to his Ministers. If the Controllers-General were confined to the right of giving advice, it was to be presumed that their advice would receive just appreciation. This expectation has been realized, and the financial situation of the country, which was so grave two years ago, is now as prosperous. But since then the power has shifted. It now belongs to the Chamber of Delegates and to several military chiefs to whose influence the Chamber submits."

The protest concludes with the following words:

"To accept accomplished facts is therefore to accept the most serious outrage which has been committed against the influence of England and France. . . . It will be a profound illusion not herein to see the prelude of a series of measures which will not leave standing any of the reforms introduced in the course of late years. The days may already be foreseen when the financial disorders which were remedied by the Commission of Inquiry and Commission of Liquidation will reappear."

Nothing could be graver than the terms of this protest and the vista of disorganization and retrogression which it opens out. It must be understood that the danger does not come from the probable influence of a popular Assembly. The Chamber of Notables is no popular Assembly, but is merely a collection of some seventy-five pashas and landowners chosen through Government influences, and identically the same in constitution as the body which from time to time was assembled by Ismaïl himself in the worst days of his rule, and for the purpose merely of obtaining coöperation in some new form of taxation. Furthermore, the military influence which is behind the action of this Chamber is as conspicuous as it can well be. There have been three revolutionary movements between February, 1881, and February, 1882. The first was accompanied by a military demonstration at the gates of the Khedive's palace in Cairo, and resulted in freeing from apprehended arrest their favorite Colonel Arabi Bey, and the change of the Minister of War. The second revolution, in September of the same year, also attended by a military demonstration, secured a change of Ministry, and resulted in the promotion of Colonel Arabi Bey to be Under-Secretary of War. By the third revolution, of February in the present year, the Ministry was again changed on an imperious demand addressed to the Khedive, and Colonel Arabi Bey was made Minister of War, and the late Minister of War Prime Minister.

In the simple recital of these facts it is quite impossible to fail to discover the distinctly military character of the whole movement. The question is fairly put, *Cui bono?* Who is the first person to profit from the movement in every case? It is Colonel Arabi Bey, in his capacity of a popular chief of a tumultuous and treasonable army. Persons' memories must be short who forget that the revolution which led to Ismaïl's deposition, because of the incapacity or untrustworthiness which it disclosed in him, was due to a military revolt in the streets of Cairo. Prime Minister Nubar Pasha and the English member of the Egyptian Ministry were the subjects of a violent personal assault, in which 2,300 officers who had come to the capital to demand their pay were intimately concerned. It is the first duty of a true, popular, and representative assembly of a constitutional kind to have the army under its control. This was one of the main matters in dispute in the English civil wars, and the effective restraint on the existence and vagaries of a standing army which the British Parliament exercises by its yearly Mutiny Act, is not the least momentous of the guarantees for constitutional liberty in England. It is, then, an extraordinary instance of the enervating effect of Oriental travel on some constitutions that English travellers of repute keep writing to newspapers at home letters full of ardent aspirations for a constitutional reform in Egypt, to be brought about by a visionary National Party, and at the point of bayonets directed against the first constitutional ruler Egypt has ever had, and then directed against the organs which alone have secured for Egypt a taste of the blessings of constitutional freedom.

A thick pamphlet has just been privately circulated among the leaders of the European population in this city, which, though anonymous, is pretty well ascertained to have been written by a late Belgian judge of the Mixed Courts. It is called 'L'Égypte et l'Europe.' More will probably be heard of it, as it is strongly and even passionately directed against the influence of France and England in Egypt. It reviews, among other things, the whole history of the financial reform, and establishes, to the writer's own satisfaction, that England and France have from first to last done Egypt nothing but harm. Much of the treatise is interesting, and implies some knowledge of the peculiar condition of the native Egyptian and of the European life in this country, especially in Alexandria. The writer thinks badly of nearly all classes of European residents here, but best of the English and Germans, and worst of the Greeks. He is of opinion that Arabic should be used familiarly in the Mixed Courts, and that no one should be appointed a judge of the Mixed Courts who has not resided two years in Cairo and passed an examination in Mohammedan law. A.

Correspondence.

ONE OF MANY ANSWERS TO "THE CHINESE QUESTION."

TO THE EDITOR OF THE NATION:

SIR: How shall Chinese immigrants be kept from coming to California in *too great* numbers? That is really the point to be practically settled; and any one who understands both sides of the question can see that neither the Burlingame Treaty, nor the more recent one, satirically called the "Angelic," nor yet the Anti-Chinese Bill now pending before Congress, can be regarded as anything more than steps in the working out of a difficult problem of international statesmanship.

Meanwhile, a wholesome and not ineffectual check might be employed at San Francisco in three ways:

1. Institute a medical inspection of immigrants, prohibiting the landing of all affected by "contagious" disease.

2. Make opium-smoking a penal offence, as it has been made by the Japanese Government, and see that the law is executed.

3. Break up gambling-hells, such as abound wherever the Chinese congregate.

Such regulations might pinch other than Chinese feet, but they would be wholesome and effective. The Asiatic immigration would be reduced two-thirds by them if carried out.

PHILADELPHIA, March 23.

CONVICT LABOR.

TO THE EDITOR OF THE NATION:

SIR: Is it fair to assume, as you seem to do in the *Nation* of March 23, that the workingmen oppose "convict labor" and favor "the enforcement of idleness as a punishment"? An act, which I understand to have their approval, is

now before the Assembly Prison Committee. It simply prohibits the contract system, provides that the convicts shall be employed by the State, and that the products of their labor shall be sold at not less than market prices.

The subject is not new in legislative annals, a similar bill having passed the Assembly of 1871. In the Senate it provoked so much discussion, disclosed such a diversity of opinion, and was regarded as of so much importance, that a special commission, composed of M. S. Meyers, E. C. Wines, and Thomas Fencer, was appointed to consider the whole subject and report at the next session. They sat during the entire summer, met at each of the prisons, penitentiaries, and houses of refuge in the State, spent six weeks in taking testimony, sent circulars containing minute interrogatories to the managers of all institutions mentioned, and of many outside of the State, and received answers to them; examined over one hundred witnesses, including inspectors, wardens, chaplains, and various other prison officials, and a large number of contractors and workingmen; and reported the evidence, with their conclusions, to the Legislature of 1872 in a volume containing 325 closely-printed pages.

They find, upon all the evidence, that "the opposition of the workingmen of the State is to the contract system alone, and not at all to industrial labor in prisons"; that "while the products of prison labor are not sufficient ordinarily to sensibly affect the general markets of the country, there is no doubt that in particular localities these products do come into injurious competition with outside labor"; that "the contract system of prison labor is bad, and should be abolished"; that "in order to a safe and successful change from contracts to State employment, it will be an essential condition precedent that political control be eliminated from the government of our State prisons"; and that "the only process by which they can be removed from the arena of politics is an amendment to the Constitution."

Such an amendment was made in 1876, since which time the prisons have been practically free from political control. The proofs of the evil effects of the contract system which the commissioners regarded as convincing stand uncontroverted, the evil has increased rather than diminished with the growth of prison industry under Mr. Pillsbury's management, and the "condition precedent" has been fulfilled. Is it not proper that the subject of contract labor should now receive legislative attention?

Yours, H. H. Rockwell.

Elmira, March 25, 1882.

[We assumed nothing about "the workingman" in general. We were talking of the "United Trade and Labor Union" of this city. At the late meeting of this body, two plans with regard to convict labor were produced: one proposed to limit convict labor to the production of articles made abroad, and the convicts' food and clothing; the other proposed to cut their labor down to five hours a day on articles actually needed by themselves, and that the rest of their time should be devoted to "education and reform," or, in plain English, idleness.—Ed. Nation.]

PROMOTION OF PASSED ASSISTANT SURGEONS.

To the Editor of The Nation:

Sir: The question of the rearrangement of the Navy Register, which is now being agitated by some of the passed assistant surgeons of the Navy, is not so simple and one-sided a matter as your statement of the case in the *Nation* of the 9th instant would make it appear.

It is true that the system of competition at the second examination was accepted by the assistant surgeons on their entry into the service, but without any adequate idea of the conditions of this competition. As the custom (for it is nothing more) worked, up to last year, there could be no fair competition between members of the same date, some of whom were allowed to remain on "waiting orders," or stationed at New York or Philadelphia, often through political influence, for many months prior to their examination, while others were compelled to remain at sea, or at some out-of-the-way station, where no hospitals, medical schools, libraries, or other advantages were accessible. Moreover, the examinations took place at different times, and often before different examiners, and, without any intention on their (the examiners') part, varied greatly in thoroughness and severity. Without some acquaintance with the workings of the service, this could hardly be understood; and the feeling that protest would be useless and might possibly endanger the chances of a candidate in the examination for promotion, was quite sufficient to keep many assistants quiet who were opposed to the competitive system.

That competition is a strong incentive to hard work and attention to duty, not only in the medical corps of the Navy, but in all other employments, very few will deny; but the competition should be perfectly fair or it defeats its own object, which is, I take it, to reward the deserving alone, and not the fortunate or influential. Nothing produces discontent and loss of *esprit de corps* more certainly than a sense of injustice, and those who have, or think they have, lost rank and pay by this unequal competition, too often become indifferent to the service and apathetic in the discharge of their duties. Furthermore, the law of promotion by seniority applies to all other officers in the Navy, and there is no apparent reason why medical officers should be governed by the competitive system, that does not apply with equal force to all the others.

The illegality of promotion by competition since 1871 has already been decided by the Attorney-General, and a law to restore the old arrangement would have to retroact ten years.

P. A. Surgeon.

Mare Island, Cal., March 18, 1882.

DIFFERENTIAL RAILROAD RATES.

To the Editor of The Nation:

Sir: Under the above heading, your correspondent, "A Railroad Man," last week discussed the question which is now being considered by Messrs. Thurman, Cooley, and Washburne, and advanced a number of arguments against the proposition that rates should be based upon the "cost of service." I think your correspondent makes a mistake common with railroad men—viz., that he loses sight of the fact that the railroad is performing a delegated function of the state—the furnishing of public highways—as well as doing the business of a common carrier. The parallel he seeks to draw between the iron-mill and the railroad company is not a correct one. The construction and operation of a railroad is somewhat in the nature of a partnership between the state and corporation. The business could not exist except by permission of the state. The state contributes the franchise, while the corporation constructs the road and conducts the business. But it is with the understanding that rates shall be "reasonable," and this can only be ascertained on the basis of the *cost of the service.* This was why, in the earlier railway charters, the ten per cent. limit was inserted—that after the capital actually invested had been compensated to the extent of ten per cent., rates should be reduced, or in other words, that the people should realize their share of the advantages of the partnership in the form of reduced rates.

Your correspondent unwittingly furnishes in his own argument an illustration that railroad men do intend to base their charges upon the cost of the service, when he says that "it was an axiom among railroads . . . that the short line between two common points should make the rates," and that "this was upon the theory that the short line would generally be the one *able* to do business at the lowest rates and live." Another and later axiom among railroad men is that every foot of grade is equal, in the cost of operating a road, to a mile of distance, while curves also have an important influence; and this is why the New York roads have been continually disputing and reducing the margin of advantage claimed by the B. & O. and Pennsylvania railroads—in short, insisting upon the principle of the cost of the service. Your correspondent says "it has never been claimed that the more costly lines should charge more," but it has been claimed that the supposed less costly lines (the short lines) should charge less, which is just what the public want them to do, and which, considering their relations to the public, it is right they should do. Every line should carry as cheaply as it can afford to carry, instead of making a combination and charging all the traffic will bear. The report of the Hepburn Legislative Committee, page 50, says:

"In July last, during a war of rates, wheat was carried from Chicago to New York for ten cents per hundred pounds; in August it was advanced to fifteen cents, a living rate; a short European harvest created an unusual demand; a bountiful harvest here created an extraordinary supply; the rates were gradually raised from fifteen cents in August to forty cents in November. It cost the railroads just as much to haul a hundred pounds of grain in August as in November. It would be difficult to make a criticism upon that raise which public judgment would sustain."

While it is evident that railroad men have not in the past paid much attention to the principle of the cost of the service, it by no means discredits the principle. The argument of your correspondent furnishes an illustration of how oblivious railroad men have become to their proper relations to the public; nor does he seem to be capable of looking at both sides, when he says:

"If it is true that the New York Central can carry freight to New York at a smaller cost than the Pennsylvania road can carry it to Philadelphia, then it follows, as New York is ninety miles beyond Philadelphia, that it costs the Pennsylvania Railroad more to carry freight to New York than it costs the New York Central; and, adopting the cost-of-service theory, the Pennsylvania road should charge more to and from New York than the New York Central charges, while charging the same to and from Philadelphia as the New York Central charges to and from New York."

The answer to this is that the Pennsylvania road should stop carrying to New York when the limit of cost is reached, and if the New York Central and Erie roads can make money at this or a lower rate, why should the other roads try to compel them to charge more? The truth of the business is, that they have all been trying to form a combination to charge the public more than reasonable rates, which should be a fair profit above the actual "cost of the service." When the New York roads see that this has worked inequitably and seek to secure a readjustment, or return to the original principle of competition, leaving every road free to carry as cheaply as it can, a great hue and cry is raised that this

is contrary to the public interest, when the truth is directly contrary, and railroad men are not lacking who boldly assert that the common principles of law and justice are all wrong, that "the fallacy of the cost-of-service theory is obvious," and that "the argument is not only in itself unsound, but fatal to New York." While it is well understood that Messrs. Thurman, Cooley, and Washburne are retained by the railroads to try and patch up a peace between them, it is to be hoped that they will, as prominent public men, have sufficient regard for public rights to consider them in connection with that of the railroads. Combinations have always been considered against public policy and in many States are directly contrary to law. Why not try the plan of letting each railroad carry as cheaply as it can afford to and attract the share of traffic that naturally belongs to it? To argue that they will, in the long run, carry cheaper than they can afford to, and that they must be protected against themselves, is to argue that railroad managers have no business commonsense and cannot be trusted out of leading strings. F. B. THURBER.

NEW YORK, March 20, 1882.

DISINTEGRATION.

TO THE EDITOR OF THE NATION:

SIR: Much interest has been felt in the accounts latterly received of the apathy and indifference felt in Ohio as to the results of the coming elections. But, after all, this apathy is but the same feeling that exists elsewhere, and especially in Pennsylvania and New York—a little more developed, perhaps, and varying slightly in its characteristics; that is all. In Ohio, preëminently a Garfield State, the paramount feeling is a detestation pure and simple for the Stalwarts, as the special enemies of the late President. In New York State the same feeling is connected with a special aversion for Mr. Conkling. In all three States there is a strong desire for greater political purity and for placing our system of government on a higher plane. Much has happened recently to disgust all men of independent feeling. The indecent control of the House of Representatives by the President in the matter of choosing a Speaker; the easy subserviency of the Senate in its confirmation of Conkling—its hesitation over so good an appointment as that of Judge Blatchford; the shameless attacks on the memory of Mr. Garfield by political allies of the clique now in power; the fact that Mr. Blaine's successor seems in no haste to condemn his ridiculous "sky-rockety policy" with South American states—all these causes combine to create widespread dissatisfaction and disgust.

In Pennsylvania the dissatisfaction among Republicans takes the special shape of an aversion for bosses and bossism, such as amounts to actual loathing. Bossism seeks to virtually disfranchise all who do not wear its own collar, and thus strikes at every independent man's self-respect. It plunders us still, and if its power in that respect is nearly destroyed, we shall have still to suffer taxation for the interest on the debt it has piled up. The immediate task before us is to send into permanent retirement every boss and all his satellites, and public opinion has fortunately now reached such a point that it is scarcely possible that any candidate for a public office nominated by boss machinery can be elected. Should such a candidate be selected for the position of Governor by a packed convention, the result will be that large numbers of Republicans will stay at home, while others will think that Democratic success will be the only effectual lesson, and will therefore aid in bringing it about.

It is, therefore, anything but improbable that before the year is out the three States of New York, Pennsylvania, and Ohio will have recorded majorities for Democratic candidates, not so much from love of Democracy as from detestation of Stalwartism. M. C. L.

PHILADELPHIA, March 21, 1882.

Notes.

HARPER & BROTHERS are the American publishers of Charles Duke Yonge's 'Constitutional History of England' (1760–1860); and have also brought out new editions of Prof. Newcomb's 'Popular Astronomy' and of the late Jacob Abbott's 'Young Christian' (with a memorial of the author); 'Money-Making for Ladies,' by Mrs. Ella Rodman Church; and 'Prudence,' by Mrs. Lillie.

Cassell, Petter & Galpin have in press an illustrated work, 'Moses and Geology; or, The Harmony of the Bible with Science,' by Samuel Kinns, Ph. D.; 'A Comic History of the United States,' by L. Hopkins, also illustrated; 'The Simple Ailments of Horses'; and several volumes in their handy "Popular Library"—'The Religious Revolution in the Sixteenth Century'; 'American Humorists,' by Moy Thomas; 'Notable Irishmen,' and 'Notable Scotchmen.' This firm will also publish Mr. Kuntz's 'American Academy Notes,' with illustrations, many autographic, after the original pictures now on exhibition at the Academy of Design.

D. Lothrop & Co., Boston, publish this month: a 'Life of Horace Greeley,' by Wm. M. Cornell; the 'Life and Writings of Charles Dickens,' by Phœbe A. Hanaford; and 'Originality,' a reply to Wendell Phillips's "Lost Arts" lecture, by the Rev. Elias Nason.

L. Prang & Co. send us samples of their Easter cards, of which the elaborateness and (in the main) tastefulness are beyond question; but they seem to us to have very little spontaneity and much formalism of design. Their merit may be likened to that of most "occasional" verse.

Macmillan's sixpenny illustrated edition of 'Tom Brown's School Days' is said to have had an immediate sale of nearly 150,000 copies. It is offered here at the same price (ten cents) with Harper's Franklin Square Library edition, which is also illustrated. One secular book, at least, therefore, has become cheap for all the English-speaking race.

The March Reference List of the Providence Public Library furnishes bibliographical aid on the subject of the German Empire and on Elements of Unity in Southeastern Europe. The February List, it is timely to recall, had for one of its topics the late Mr. Longfellow.

The Annual Report of the St. Louis Public School Library for 1880-81 suggests that this institution, with its special patronage, meets the difficulty which general public libraries experience in protecting the young from too much and deleterious fiction. Though adults may and doubtless do use it, they cannot complain of the censorship exercised on behalf of those for whom the library was founded. Does not this contain a hint for Boston?

Houghton, Mifflin & Co., Boston, have prepared a 'Catalogue of Books' which is an admirable specimen of typography, but is distinguished by the large number of portraits which properly illustrate their list of authors. These mark various stages in the art of woodcutting and in publishers' enterprise, but are mostly truthful and valuable mementos. On application this will be sent to any address without charge.

Mr. F. H. Underwood's 'James Russell Lowell: a Biographical Sketch' (Boston: Osgood) would be none the worse for having already seen the light, as we think it has, in one of our magazines. In its present form it is illustrated with a somewhat muddy heliotype portrait of the poet, and several interesting landscapes more successfully depicted by the same process.

No better choice than Professor Goodwin, of Harvard, could have been made for first director of the American School of Classical Studies to be established at Athens in the fall. We understand that he will sail for Greece in June. According to the plan already made public, his salary will be continued by the college.

That Mr. George Wilkes is possessed of a very trifling amount of humor was shown by his putting forth his 'Shakespeare, from an American Point of View' in 1877. It is shown afresh by his remark in the preface to the third edition just published by D. Appleton & Co., that in the United States the reception of this amusing production "was of the most flattering character; and, indeed, may be characterized as having been unanimously favorable." In spite of numerous improvements now made upon the London edition, the best part of the book still remains not Mr. Wilkes's, but Professor Taverner's ("The Respective Styles of Shakespeare and Bacon, judged by the Laws of Elocutionary Analysis and 'Melody of Speech.'")

Le Livre for March is prettily decorated with an etched border in brown ink, framing the opening sentences of Champfleury's half-malicious sketch of Paul Lacroix ("Bibliophile Jacob"), whose portrait from a drawing made in 1835 is a pleasant souvenir of the Romantic period. Far more seriously and laboriously M. Charles de Lovenjoul traces the literary projects of Théophile Gautier, which were either altered, or half carried out, or abortive. The altered ending of 'Capitaine Fracasse,' as well as the singular interruptions in the composition of this story, is an example of these disclosures; another is the unpublished fragment belonging to 'Loin de Paris'; a third, an unpublished stanza of "Fumée," which is wholly reproduced in autograph facsimile, etc. A capital "*portrait charge*," or grotesque big-head-and-little-body likeness of Gautier, *à la turque*, by H. Mailly (1862), still further embellishes the article and the magazine.

The Rev. S. Beal, Professor of Chinese at the London University, has lately published an 'Abstract of Four Lectures on Buddhist Literature in China,' delivered at University College. It can only be had of the author, whose address is Wark, Northumberland, England. In a recent communication to the Royal Asiatic Society, Professor Beal has made an interesting identification of the Yue-chi of the Chinese with the Vaggi or Vriggi of Vesâlî in India, and of these again with the Scythians, which materially assists in the interpretation of Plate 38 of Fergusson's 'Tree and Serpent Worship,' and "also goes to confirm the idea," says Professor Beal, "that the Sâkyas, to whom Buddha himself belonged, were a Turanian tribe, and in sympathy with these Vaggi, whom Buddha resembles in so many personal distinctions."

—The seventh volume of the reports of the Boston Record Commissioners consists of a reprint of the town's records from 1660 to 1701. These relate largely to lands and boundaries, to schools, streets, wharves, sanitation—if that term be allowable in face of an explicit ordinance (1666) not to throw "garbidge, beast entralls, &c." into the streets, but "into the Mill Creek over the Mill Bridge"—police, elections, etc. An ever-present fear of fire, from chimneys and tobacco pipes, especially, is manifested. Citizens are indemnified for having their houses blown up to check past conflagrations, a fire engine is

got at last from England, and the keeper's motion to be excused from training and watching is met by an allowance of "20s in mony p. ann upon that consideration & he to get himselfe clear from traininge & watching as well as he can." Lastly, that widening of the streets permitted by every fresh devastation is kept in mind and improved, as it has been to our own time. Innumerable licenses are entered "to draw Beere" and to sell chucalatto (or chuculetto, or chocolatta) and syder. Hucksters who "forestale ye market by goeinge out into ye necke & high way to Bostone to buy vp the provisions yt are brought in or comeinge into ye Towne & the sell the same againe at extraordinary deare rates," are made the object of a "prudentiall order." The case of John Lewis is entered as if with intent to order him out of the town, but the clerk in his amazement may have forgotten to finish the entry. John "came from Road Island, where his wife gaue him a paper of dismission from her in Octobr last & libertie to marry another woman, & he is now ingaged to ye widdow Williams to marry her by theire owne confessions & lodgeth at Joseph Preists." In 1690, "The Selectmen humblie pray the house of Correction may be made Capeable to entertain Idle drunken and disorderlie persons"—a use of the word entertain which sounds as odd to our ears as does "artist" in the following context: "Ye sd line ["between Boston & Lyn"] shall bee run by L. Fisher & Jno. Gardiner, if to bee had, or some other Artist." This word, by the way, does not appear in Mr. Priest's praiseworthy "index of places and subjects" which supplements that of names. The irrepressible negro occurs early, but only once in these records, on p. 5, and then as the "Chinese cheap laborer" of that day (5th of 9th mo., 1661):

"Whereas Mr. Tho: Deane hath employed a Negro in ye manufacture of a Coop. contrary to ye orders of ye Towne Itt is therefore ordered yt ye sd Mr. Tho: Deane shall nott employ ye sd Negro in ye sd manufacture as a Coop. or any other manufacture or science after ye 14th day of this month on ye pœnalty of 20s. for euery day yt ye sd Negro shall continue in such employment."

One of the very last votes was "that a house be built for old Mr. Ezek. Cheever the Latine Schoolmaster."

—There is not one of the New England or Middle States but ought to envy New Jersey the possession of such a map as her State Geologist, Professor George H. Cook, and his assistants, aided by the United States Coast Survey, have just published. This map is in two sheets, and represents perhaps less than a tenth part of the entire area of the State, extending from South Amboy, at the mouth of the Raritan, north to Pompton Plains, and eastward of a line drawn from Green Pond to Bound Brook. In this tract lie the great cities of Newark, Jersey City, and Paterson, and the smaller ones of Hoboken, Elizabeth, Perth Amboy, Rahway, New Brunswick, Orange, Boonton, Plainfield, Morristown, etc.—in all, a population approaching six hundred thousand, and much the larger half of the inhabitants of the State. Politically it takes in the whole of Hudson, Union, and Essex, and parts of five adjacent counties. Geologically, it passes from the great clay region on the south into the glacial region bounded by the well-marked moraine which trends in a northwesterly direction from Perth Amboy, and embracing principally the field of red sandstone, hemmed in on the water side (the Palisades) and pierced in the centre (Orange Mountain) by trap, with part of the adjacent limestone, gneiss, and granite. The basins of the Passaic, Hackensack, Rockaway, Rahway, and Raritan Rivers are more or less fully depicted. The essential character of the map is topographical. It is on a scale of one mile to the inch, with contour lines, showing the level above mean tide, ten feet apart in the plain country and twenty feet apart in the hilly portions, which latter by far predominate. Finally, the ro ds are completely laid down, and the pedestrian, the rider, or the bicyclist has now opened to him a district thirty miles square, containing some of the best artificial highways in the United States, and some of the most charming rural scenery. We should add that Staten Island is also delineated topographically, as by nature a part of New Jersey rather than of New York, and that the whole of Manhattan Island, the southwestern extremity of Long Island (including Brooklyn and the whole of Coney Island and its railway system), are flatly plotted on the eastern sheet. The map, therefore, serves a variety of purposes, and is not calculated for Jerseymen alone, though its appearance simultaneously with an elaborate and flattering essay on the climate of New Jersey, in the newly issued report for 1881 of the State Geologist, suggests a probable effect of inviting first visitors and then permanent settlers to this beautiful suburb of our great metropolis. The execution of the map has been entrusted to the establishment of Julius Bien, whose workmanship is beyond comparison in this country, to say the least. We conclude by calling the attention of the Boston Appalachian Club to this contribution to its objects, in the hope that it may be prompted to secure for Massachusetts a geological survey, and ultimately such a topographical chart as this.

— Mr. Grant White's second paper on the "Opera in New York," in the April *Century*, brings his entertaining narrative down to the year 1847, and passes from mere tradition, or antiquarian research, into undisguised personal reminiscence. Fanny Elssler, John Braham, and Madame Anna Bishop are the best remembered names in the present catalogue, which is delightfully illustrated, as before, by contemporary portraits and other engravings. It is a singular coincidence that, while the magazine was on the press, an actual performance of Beethoven's "Fidelio," by Mr. Mapleson's company, was contradicting Mr. White's printed statement that that opera had not been given in New York since 1839, when it was performed by the Inverarity Company. But, what is more singular, as we ourselves can recall three times (in as many seasons) in which "Fidelio" has been performed in this city within the past twenty years, Mr. White here demonstrates the irrelevancy of his chaff in the opening of his first paper, about "the temporal vision of the average denizen of New York, as he looks backward," being bounded "by a horizon about fifteen years off." Ernst von Hesse-Wartegg's description of "Tunis and its Bey" is light and pleasant reading; Mr. Henry Watterson's "Oddities of Southern Life"—a "sampling" of old Southern humorous works, of the kind which Mr. Thomas Hardy found helpful to his impoverished invention—is even more dreary than the original sources; Mr. Andrew Lang's critical sketch of Matthew Arnold serves a good purpose in redirecting the public to so great a poet, but deals with his anti-Philistine and metaphysical prose rather, it would seem, perfunctorily than because Mr. Lang has a very profound interest in the problems so much taken to heart by Mr. Arnold. Undoubtedly the most impressive article in the whole number is Madame Ragozin's "Russian Jews and Gentiles," which is a skilful and apparently candid attempt to account for the persistent hostility of the Russian population to the Jews among them, and for occasional outbreaks like those hardly yet over in the Czar's dominions. To sum up, in a few words, the counts in her charges is not easy. Relying on the revelations of a converted Jew, who, we are left to infer, is a solitary instance of revolt against the immoral code by which his former co-religionists are bound in their dealings with the Gentiles, Madame Ragozin portrays a racial character combining the pleasing qualities of a usurer, a soul-destroying rumseller, a free-mason (with his horrid oaths and imprecations), a Jesuit, a member of the Vehmgericht. The great engine of Jewish greed for landed property is a peculiar communistic organization recognized for purposes of taxation and class government by the Russian authorities, and especially the box-duty on meat, which, though it grinds the face of the common Jew, furnishes much of the funds for the bribery of the local administration and the perpetuation of an intriguing, rapacious, oligarchic power. How far this is historical and antiquated, and how far fiction, we have no opportunity of judging. The editor promises a reply next month, and we shall endeavor to report it. Madame Ragozin, we observe, considers it highly unpatriotic in the Russian Jews to appeal so freely "to foreign sympathy and interference." They have, in fact, the resource of chalking crosses on their doors and shutters, and placing saints' images and Easter loaves in their windows, when the mob is abroad ; and perhaps they ought to be content with this.

— The colonial and revolutionary archives of Maryland are about to be transferred from the Land Office at Annapolis to the keeping of the Maryland Historical Society in Baltimore, in accordance with a bill lately passed by the Maryland Senate (March 16), and House of Delegates (March 12)—a bill which was the outgrowth of a memorial presented to the Legislature by the above Society, and already mentioned in these columns. These archives embrace the acts and resolves of the Province of Maryland ; the council books of the Proprietary ; the journals and correspondence of the Council of Safety ; letters from Maryland delegates in the Continental Congress ; sixty-two manuscript letters from George Washington ; letters from Knox, Marion, Gates, Lincoln, Greene, Lee, Lafayette, Pulaski, Steuben, De Kalb, De Grasse, Rochambeau ; and papers relating to the Maryland militia, which did such efficient service at the North under Smallwood, and at the South under John Eager Howard. While many valuable records of colonial and Revolutionary Maryland have been lost or damaged from lack of proper care, those which yet remain will be faithfully preserved by the Maryland Historical Society, whose library is already a treasure-house of Maryland laws, documents, manuscripts, family papers, pamphlets, broadsides, and newspaper files (covering the entire Revolutionary period, and extending as far back as 1728). For the safe-keeping and easy consultation of the State papers and most valuable Society documents, a fire-proof room, adjoining the main part of the library, will probably be constructed, for members of the Society are now endeavoring to obtain funds for this purpose. The State has made an appropriation sufficient to begin the work of "arranging, editing, and publishing" the archives, together with "other documents pertaining to the history of Maryland." The State will be the owner of all volumes published by its aid, but the Society is empowered to sell these publications at cost price, and to add the proceeds to the State Publication Fund, simply reporting progress, receipts, and expenditures, from year to year, to the Legislature. Thus an undertaking which in the hands of politicians might perhaps have become a piece of printer's jobbery, as some States have found to their cost, is removed from all temptation and made a scientific

enterprise, enlisting not only legislative aid, but also the resources of a learned Society and the pride of all good citizens. The enterprise is kept upon a State footing, honorable to Maryland, while entirely in the hands of a trustworthy record commission.

— The Maryland Historical Society, when it shall have made the archives of the State generally accessible to students, will be in a position to encourage original research. It has a publication fund of $20,000, left by George Peabody for the printing of papers elucidating the history of Maryland or of the country at large. At a recent meeting, the Society voted a considerable appropriation from its treasury toward securing copies of certain Maryland documents, missing in the Annapolis collection, and yet preserved in England, for it was the custom of the proprietary Government to send duplicates of all important Acts of provincial legislation to the mother country. The "Stevens Index of Maryland Documents in the State Paper Office, London," will doubtless be of great service to Maryland in recovering some of her long-lost records. This index, or calendar, contains descriptions and abstracts of 1,729 Maryland documents, covering the period from 1626 to 1780, and thus admirably supplementing the Annapolis collection. The index was prepared many years ago at the suggestion and expense of Henry Stevens, and was by him sold for £100 to George Peabody, who presented it to the Maryland Historical Society. This gift, of trifling cost when compared with other benefactions to Baltimore by the same hand, will yet, like the Peabody Institute, increase and multiply in power in proportion to the growing appreciation of its significance.

—The *Science Observer* has distributed, with its accustomed punctuality, a circular containing the elements and an ephemeris of Comet Wells, 1882, discovered on the morning of the 18th inst. at the Dudley Observatory, Albany. The elements are necessarily only approximate, being derived from observations during so short an interval, but they answer well enough as a basis for an ephemeris which will enable the comet to be followed for two or three weeks hence. All these data have been cabled abroad, using the ingenious telegraphic code devised by Mr. Chandler, of the Harvard College Observatory, and they will be circulated almost simultaneously in Europe, from Aberdeen and Berlin. The comet is already bright enough to be seen with any telescope above three or four inches of aperture, and has a pretty well-defined nucleus, and a tail which is already equal in length to nearly one-half the apparent diameter of the moon. Of this comet Prof. Boss says: "It is remarkable for its small perihelion distance, and its intense brightness in relation to its present distance from the sun. The elements cannot be considered to resemble those of any previous comet." So far as can now be said, the comet will be nearest the sun early in June next.

—Of Meyerbeer's operas "Les Huguenots" is at present the most popular in every city where Italian opera flourishes. "Le Prophète," "Robert le Diable," and "Dinorah" rank next in popularity, while for his last work, "L'Africaine," the demand seems to be much less urgent. In New York it had not been heard for so many years that its revival at the Academy on the 22d inst. had almost the appearance of a novelty, and it accordingly attracted an immense audience. New and gorgeous scenery and costumes had been promised by the management, and to a large extent this promise was kept. Mr. Mapleson has an uncommonly good-looking ballet corps, and a successful effort was made in the fourth act to display it to the best advantage by means of gaudily-colored dresses, ingenious grouping and processions, and a picturesque background, with Indian vegetation and temples. The scenery in the third act was much less satisfactory. The cast of characters was necessarily as strong as Mr. Mapleson could make it, for the vocal score of "L'Africaine" is not of the easiest. Signor Galassi created the strongest impression by the vigorous accents of his sonorous organ, by his finished acting and his superb appearance. Next in order of merit comes Madame Hauk, whose *Selika*, if not fully equal to her *Carmen* from a histrionic point of view, was yet a fine personation. Deviations from the written score are very rare with this artist, and her pure, rich voice gives as much pleasure to the ear as her conscientious and clear phrasing does to the intellect. Signor Campanini's vocalization was characterized by the usual *aplomb*, smoothness, sentimentality, and occasional lack of tone-color; while in appearance, gesture, and facial expression he was as far removed from the ideal *Vasco da Gama* as from the ideal *Lohengrin* or the ideal anything. The rest of the cast calls for no serious praise or censure. Signor Arditi had his vocal and orchestral forces under proper control, and, considering the many difficulties of the work, it must be admitted that the performance as a whole was creditable to all concerned, although very far from perfection.

—Whether the opera is worth all the trouble and money expended on it is a question which we must answer in the negative. "L'Africaine" has one feature in common with Goethe's "Faust" and Wagner's Nibelung Trilogy: it occupied its author's attention at intervals during more than two decades. Here, however, the resemblance ceases, for, while in "Robert" and "Les Huguenots" there are occasional flashes of real genius, there is nothing in "L'Africaine," with the exception of the ballet-music, that could be musically ranked with "The Mascotte" or "The Merry War." Meyerbeer received the libretto of "L'Africaine" from Scribe in 1838, and at once began to make so many changes in it that Scribe finally lost all patience and actually withdrew the book. The music also he continued to alter, introducing a new song or chorus here and there, and never satisfied with the work as a whole, or the singers available for its production, until finally death overtook him, in 1863, before the work had been publicly performed. It has been asserted that this opera best represents Meyerbeer's emotional side, and that it is the most sympathetic and the most purely musical of all his works. But it is difficult to discover much emotion or good music in it, although it must be admitted, on the other hand, that it is comparatively free from the claptrap and direct appeals to the galleries that vitiate most of his other works. It is said that at its first production in Paris the performance of this opera occupied more than six hours.

—The Philharmonic and Chorus Societies again united their forces on Saturday evening and gave their second and last concert of the season at Steinway Hall. It was in every way equal, and in some respects superior, to its predecessor. The programme combined the three essential elements of novelty, beauty, and grandeur, and the execution was excellent in all but one or two of the numbers. It could not be expected that so large a body of singers, only united a few months ago, should display the unfailing precision of attack, and the smoothness and even gradations of sound, that will come after a few seasons' practice; but we doubt if in this or any other country a chorus has ever been organized which, after so short an interval, could interpret in a more satisfactory manner that crowning glory of vocal difficulties, Beethoven's Missa Solennis, of which the Kyrie and Gloria were sung. The Sanctus was heard at the last Brooklyn concert, and the whole work forms part of the May Festival scheme. In the days of Bach the orchestral instruments, when united with the voice in one composition, were treated very much like vocal parts. In Beethoven's great Mass the opposite extreme is reached. It is correctly described by Richard Wagner as a purely symphonic work, in which the vocal parts are treated like human instruments, while the underlying words serve merely as basis or material for the voices. Beethoven was too independent and purely musical to allow the traditions of vocal limitations and religious symbolism to impede the flight of his bold imagination. Consequently this work, like many others by Beethoven and like most of Wagner's, must not be judged from the point of view of the beautiful, but of the sublime, in the sense in which this word is used by Kant and Schopenhauer. Besides these selections from the Mass, the chorus assisted in the performance of the nine selections from Gluck's "Alceste," which were discussed in this place in connection with a recent Brooklyn concert, and in one of the two numbers from Berlioz's "Benvenuto Cellini" which preceded the Mass. The soloists in the Beethoven, Gluck, and Berlioz compositions were Mrs. Osgood, Miss Cary, Mr. Toedt, and Mr. Henschel. Of these the two first named have the advantage of more sonorous and beautiful voices, but Mr. Toedt and Mr. Henschel did not lag behind in their attempts to interpret conscientiously their difficult parts. Miss Cary also sang "Voi che sapete," from Mozart's "Figaro." The purely orchestral numbers were Schubert's unfinished symphony and the new supplementary movement to Rubinstein's Ocean Symphony. To judge by the persistent manner in which Rubinstein returns to this favorite work, he must have been more impressed by the ocean than Oscar Wilde. His aim seems to be to convey the idea of oceanic immensity by an indefinite number of new movements, already very numerous. Being only fifty-three years of age, he may easily live twenty more; and if he keeps on adding a movement every year, as he has done within the last decade, his ideal may be fully realized at the end. The new movement is not so beautiful as some of its predecessors, but is eminently characteristic and descriptive. It begins with a calm motion, which gradually leads up to a storm. This is followed by a lull, in which, however, the waves still run high, and toward the end the storm again returns with somewhat abated force. The composer makes full use of all the modern orchestral resources. The howling and whistling of the violins and piccolos up and down the scale, the blaring of the trombones, the growling of the double-basses, and the final crash of the drums, produce an effect that is suggestive both of the fall of the Tower of Babel amidst a storm, and of the agitated passages in the "Flying Dutchman." But, in its display of true elementary force and grandeur, Rubinstein's storm-music is as inferior to Wagner's as in its turn it is superior to the weak music Meyerbeer has written to the storm-scene in his "L'Africaine."

GREEN'S MAKING OF ENGLAND.

The Making of England. By John Richard Green, M.A., LL.D., Honorary Fellow of Jesus College, Oxford. London: Macmillan & Co.; New York: Harper & Bros.

MR. GREEN is an author the brilliancy of whose talents is apt to throw into the shade the solid merits of his work. He cannot, if he would, be dull. He is endowed with rare grace of style. He knows how to bring into relief the interest-

ing features of unattractive subjects. He can combine a mass of detached facts, which, in other hands, would simply oppress the memory of students, without in the least impressing their imagination, into a narrative which it is easy to read and hard to forget. He is, in short, a literary artist. This is patent on the very surface of everything he writes. It is, therefore, natural that the stupidity, no less than the dulness, of critics should suggest to them the conclusion that he is a literary artist, and nothing more. The soundness of this inference may appear confirmed by the fact that erudition and original research are obviously not the most prominent of Mr. Green's characteristics. He has always avowed himself, with admirable honesty, the pupil of teachers such as Freeman and Stubbs. Yet though all this is true, nothing is a greater mistake than to suppose or suggest that Mr. Green is a brilliant writer who has not made serious contributions to the knowledge of history. The truth is, that while every page he writes sparkles with life, vivacity, and spirit, Mr. Green, though occasionally too fond of a paradox, and, when writing of periods such as the eighteenth century, which lie a little beyond the limits of his special province, somewhat lax in his statements, is at bottom an author of sound and sterling good sense, whose special excellence lies in his grasp of the main facts of the eras with which he is called upon to deal as an historian. 'The Making of England' exhibits in the very strongest manner this "bottom of good sense" and of sound judgment, which underlies all his speculations, and students will miss half the instruction which they ought to gather from the pages of Mr. Green's last work if they are led by the beauty of his style and the ingenuity of his thoughts to overlook the sense and wisdom to be found in every page of the book.

Whoever wishes to assure himself that the most brilliant is also one of the most sagacious and sensible of historians, should note specially the combination of skill and judgment with which Mr. Green states, and to a great extent solves, the essential and, it must be added, most perplexing problem of early English history—namely, how it happened that the settlement of the barbarians, to use the classical term, in the Roman province of Britain had an entirely different character from their settlement in other Roman provinces such as Gaul or Italy. No person who reads 'The Making of England' will fail to understand the nature at least of the puzzle. Gaul and Britain were each provinces of the Roman Empire; each of them was the field of Roman civilization. In each, Christianity, the official religion of Imperial Rome, became the creed of the state. Britain and Gaul alike were occupied by Germanic and heathen conquerors. What the Franks were to the Gauls, that the various tribes of Saxons were to the Britons. Roughly speaking, the fate of the Gallic and of the British province may be said to have been the same. Yet—and this is the matter which calls for explanation—the same causes appear to have led in the different countries to diametrically opposite results. The Franks assuredly did not in any sense drive out the Latinized Gauls. The civilization of Rome, the language of Rome, the laws of Rome, were not in any sense rooted out from Gallic soil. The imperial civilization and the imperial religion triumphed over the German conquerors. France has remained, and will remain for ever, one of the Latin countries of the world. The Jutes and Angles, on the other hand, did drive out the Romanized Britons from the greater part of Britain. When the country was at last transformed from Britain into England, a far deeper change had taken place than is marked by the transformation of Gaul into France. A British or Roman had become a Teutonic land; the advance of the Saxons meant the extirpation or the withdrawal of the British.

This fact has naturally excited not only attention, but doubt; for the expulsion of one race by another is in reality one of the rarest of phenomena; and ingenious theorists, having shown, what is certainly true, that Roman civilization struck firmer root than is popularly supposed in Britain, have attempted to demonstrate, what is certainly false, that the British race and Roman civilization exerted great and direct influence on the institutions of the English invaders. Mr. Green, following essentially the steps of Mr. Stubbs, demonstrates with a clearness and impressiveness not to be found in any other writer with whom we are acquainted, that the British retreat from the greater part of England is as undoubted a fact as can be any event of the past. His mode of enforcing this conclusion is not the use of out-of-the-way arguments or of fine-drawn subtleties, but the plain statement of large and visible historical phenomena. The "tradition," in the first place, "both of conquerors and of conquered, tells us that an utter change had," as a consequence of the Saxon conquest of England, "taken place in the men that dwelt in it. They knew themselves only as Englishmen, and in the history or law of these English inhabitants we find as yet [A.D. 577] not a trace of the existence of a single Briton among them. The only people that English chronicle or code knows of as living on the conquered soil are Englishmen. Nor does the British tradition know of any other. Had Britons formed part of the population in the land which had been reft away by the invader's sword, they must have been known to their fellow-Britons beyond the English border; but in the one record of such a Britain that remains to us, the history of Gildas, there is no hint of their existence. To him, as to his fellow-countrymen, the land of the Englishmen is a foreign land, and its people a foreign people."

Tradition is in such a case a matter of great weight; but, in the second place, local nomenclature, the evidence of language, the condition of English towns—facts, as the saying is, which cannot lie—confirm the witness of tradition.

"The designations of the local features of the country—indeed, the names of hill and vale and river—often remain purely Celtic. There are 'pens' and 'duns' among our uplands, 'combes' in our valleys, 'exes' and 'ocks' among our running waters. But when we look at the traces of human life itself, at the names of the villages and hamlets that lie scattered over the countryside, we find them purely English. The 'vill' and the 'city' have vanished, and in their stead appear the 'tun' and 'ham' and 'thorpe' of the new settlers. If we turn from the names of these villages to those of the men who live in them, the contrast becomes even stronger. So far as existing documents tell us anything, they tell us that Roman and Welshman wholly vanished from the land. When Gregory of Tours writes the story of Gaul after its conquest by the Franks, we meet in the course of its narrative with as many Roman names as Frank. But in the parallel history of Britain after its conquest by the English, which we owe to Bæda, we meet with no British or Roman names at all."

Latin, which had been the official tongue of the province, the language of its soldiers and civil administrators, withdrew before the invaders to the southwest and the west. When it reappeared with the Christian missionaries it came as a foreign tongue, unintelligible to the men dwelling in England.

"The British tongue—the tongue, that is, of the mass of the population even under Roman rule—though it lived on as the tongue of the Britons themselves in the land to which they withdrew, has left hardly a trace of its existence in the language which has taken its place over the conquered area. There is the same utter change in government, in society, in law. The Roman law simply disappeared; and no trace of the body of Celtic customs which form the Welsh law can be detected in the purely Teutonic institutes which formed the law of the English settlers."

If any fragment of the provincial life had survived, it would have been the municipal organization, which elsewhere handed down the tradition of the Empire.

"But with the English conquest the towns disappear. . . . As the conquest passed over them, the towns of Roman Britain sank into mere ruins. Some never rose from their ruins. Anderida remained a wreck of uninhabited stones in the twelfth century, and its square of walls remains lonely and uninhabited still. Silchester and Uriconium, large as they were, have only been brought to light again by modern research. The very sites of many still remain undiscovered."

There is, thirdly, the evidence of religion. The faith of Britain perished utterly.

"Nothing brings home to us so vividly the change which had passed over the conquered country as the entire disappearance of its older religion. Had the conquest of Britain been in any way like the conquest of Italy or of Gaul, its religious issue could hardly have been other than theirs. Had the Britons been left existing on the soil as a subject population, . . . the change of faith would most probably have been a change in the religion of the conquerors, and not of the conquered. . . . It was not the Britons who would have become worshippers of Woden, but Engle and Saxon who would have become worshippers of Christ. . . . But what we find is the very reverse of this. The Church and the whole organization of the Church vanished. . . . So far was any connection with Western Christianity from existing, that all the rest of the Christian world, whether of Celtic or of Roman obedience, lost sight of the conquered parts of Britain altogether. When Rome long afterward sought to renew its contact with it, it was as with a heathen country. . . . When missionaries at last made their way into its bounds, there is no record of their having found a single Christian in the whole country. . . . It is hardly possible to conceive a stronger proof that the conquest of Britain had been a real displacement of the British people; for if Wodenism so utterly supplanted Christianity, it can only have been because the worshippers of Woden had driven off from the soil the worshippers of Christ."

This, then, is the fact. What is the explanation? The answers generally given are unsatisfactory. The Saxons, it is said, were a race of peculiar ferocity. There is not, however, a tittle of proof that they were more savage than the Franks or other Teutonic tribes. Savages, moreover, especially when invading in small bodies, preserve women and children as part of their plunder. The Britons, it is suggested, were a feeble race, unable to resist the invaders. The fact, however, is, that the British resistance was peculiarly lengthy and tenacious. The explanation of a phenomenon which still requires further investigation is to be found, according to Mr. Green, in the admitted facts of the case. The inhabitants of Britain were destroyed just because they were able to resist. The invaders, coming as they did by sea, could arrive only in small numbers. The character of the country—a land, as Mr. Green is never weary of reminding his readers, of marshes, of hills, of forests—lent itself easily to defensive warfare. Every step in advance was gained by battle. Wherever there is fighting there is slaughter, and the Britons who were not slain in battle retreated to the hills and the woods. The Roman civilization, moreover, though real, was superficial; hence a far more rapid return to British barbarism than might at first sight have been expected. A result follows to which Mr. Green hardly gives all the weight which seems to be its due. The invaders of Gaul and Italy were conquered by the impressiveness of Roman civilization. The empire with which they more than half amalgamated filled them with awe. When the Saxon invaders had destroyed two or three towns, they

found themselves face to face, not with the relics of an august civilization, but with men little less barbarous than themselves.

The very same facts which account for the British resistance also account for British relapse into barbarism. Invaders who would have stood awestruck before the shadow of the majesty of Rome, found little to impress their imaginations in the semi-civilized society of Britain. It was not Christianity, but the organization of the Latin Church, which overpowered the barbarians. The British Church, separated by the seas from the organization of Rome, was deficient in the chief means of resistance and of victory. Something must, further, we suspect, be allowed for that mass of causes which, just because we cannot explain them, we call by the name of race. There is something at any rate very curious in the mingled tenacity and weakness of the Britons. They could resist and they could retreat; but in the long run they could never conquer. However this may be, Mr. Green is assuredly right in attributing the fate of the Britons to the peculiar circumstances both of the Saxon attack and of the British resistance, nor is the correctness of his conclusions the main point worth notice. He may be, we may almost say he must be, in error on many points. As knowledge of the past extends, the views of each investigator must in their turn be corrected. What is of importance is far less the truth of Mr. Green's theories than the indisputable soundness of his method. His eye is always turned to the large and striking facts of the past. He discards the perilous byways of theory and crotchet, and keeps along the solid and clear broad high-road of common sense. An author who does this has done much more than establish the certainty of favorite speculative conclusions. He has achieved the best work which an historian can achieve: he has taught his readers the only sound mode of historical study.

RECENT LAW BOOKS.

Mr. Joel Prentiss Bishop's 'Commentaries on the Criminal Law' (Boston: Little, Brown & Co.; seventh edition, revised and enlarged; 2 vols.; 1882) is a book of standard authority. Considerable alterations have been made in the present edition. A chapter on "Authorities and their Weight" has been added, which contains a brief discussion of *stare decisis—i. e.*, the rule which makes precedent binding—in criminal cases; and several other chapters have been rewritten in part or altogether. Ten thousand four hundred and sixteen is the total number of cases cited in the two volumes, the number of new cases added in the present edition being 902. The new chapter on "Authorities and their Weight" will be found of not a little use in practice, but Mr. Bishop's discussion of the doctrine of *stare decisis* can hardly be considered of much value. He makes a distinction with regard to this rule between acts wrong in themselves and crimes merely prohibited by statute, and suggests that in the latter case any departure from rules of decision already announced would result in gross injustice, being too much in the nature of *ex-post-facto* judicial legislation; while, at the same time, with regard to acts wrong in themselves, he thinks there is no very great objection to overruling established doctrines if clearly erroneous. This distinction involves a discrimination by the court between the two classes of cases which seems wholly unwarranted by any principle of our jurisprudence. The courts know, and can know, no difference between acts wrong in themselves and acts prohibited by statute, so far as the binding force of precedent goes. Another suggestion of Mr. Bishop's is, that in civil cases the principle of *stare decisis*, involving as it generally does rules of property which the business community accepts as guides in its transactions, and under which rights are acquired and transferred, is of more importance in making the law uniform and settled than in criminal cases. But why criminal law should be considered as not affecting rights of property, considering that most crimes are violations of property rights, it is hard to see.

In his preface Mr. Bishop calls for the establishment by the National Bar Association, or some similar body or individual, of a bureau to examine every book on the law, and especially every new one, and report in writing replies to the following questions: "Is it a reprint of a foreign work?" "How far is it original?" "Are there concealed piracies?" "Was the work done personally by the ostensible author?" If a book of reported cases, "did the judges, in their opinion, deal fairly with counsel, text-writers, and one another?" We can see only one objection to this proposal, and that is, that a second report would have to be made by some second association or individual as to how the work of the first had been done. After all, the worth of law books and the manner in which they are written can only be tested by time and use. With regard to some well-known works in use by the profession for several generations, it is still difficult to make out their exact position and value. An amusing instance of this we find in Mr. Bishop's treatise. He says of Kelyng's Reports: "The collection is of considerable value, and it has marks of greater accuracy than most of the old posthumous Reports." On the other hand, Lord Campbell, in his 'Lives of the Chief-Justices,' closes his life of Kelyng with the remark, "I have to mention among his other vanities that he had the ambition to be an author, and he compiled a folio volume of decisions in criminal cases which are of no value whatever, except to make us laugh at the silly egotisms with which they abound." Mr. Bishop's treatise is so well known that it is hardly necessary at this day to go into its general merits, except to say that it is chiefly to be prized as a digest of cases, and not for its original discussions of the law.

The new method of legal study at the Cambridge Law School is well illustrated in a 'Selection of Cases on the Law of Bills and Notes and other Negotiable Paper,' by Prof. J. B. Ames (2 vols. Boston: Soule & Bugbee. 1881). It is a companion volume, in a certain sense, to Prof. Langdell's 'Cases on Contracts,' and is primarily intended for the student rather than the practising lawyer. The volume contains, however, a great deal of valuable discussion and suggestion in the form of very compendious notes to the cases. The method of studying law by going to the original authorities, instead of taking the principles at second hand from the text-books, has now made such headway at Cambridge that it is likely to spread to the other law-schools of the country. There is no doubt that it is the true and only way to gain an understanding of the common law. Those who take the opposite view, and cite in proof of the serviceability of text-books such commentaries as those of Kent and Blackstone, which have, in the course of time, come to have an independent value of their own, should remember that these works themselves were originally mere expositions of the law, extracted by teachers of it from the cases at first hand. They taught the law as found in the cases very much as Messrs. Langdell and Ames now do, although they did not see quite as clearly as we now see the distinction between the authority of a decided case and that of a commentator. One great objection to the method of learning law exclusively from text-books is, that after it has been learned, the student, as soon as he arrives at the point where actual practice begins, is rudely awakened to the fact that his method of acquiring legal principles is not the one used among the lawyers or by the judges who decide the cases which he may be called upon to argue. The objection to the new system frequently raised is that it produces "case-lawyers"—that is, lawyers whose heads are stuffed full of authorities, but are unable to extract from them any principles of decision. But no intelligent instructor in law would use cases for any other purpose than with a view to generalization, as far as possible, in the end. At any rate, there is far more danger at the present day from loose and hasty generalization of legal principles than there is from confining the student too closely to concrete facts as they appear in decided cases.

The ninth edition of 'Story's Commentaries on the Law of Agency,' by Mr. C. P. Greenough (Boston: Little, Brown & Co. 1882), contains more than fourteen hundred new cases. We are glad to see that the text of the original work has been restored to that of the last edition published by Judge Story himself, while all interpolations and additions by subsequent editors have been preserved in the notes. The notes of the present editor are very compact and valuable. Story's work on Agency is still the leading authority in this country, although the subject since his time has received such a development that it is difficult to say how long this will remain true.

Mr. John D. Lawson's treatise on the 'Law of Usages and Customs, with Illustrative Notes' (St. Louis: F. H. Thomas & Co. 1881) is arranged, like the author's previous work on 'Common Carriers,' in the form of leading cases, with appendices in the shape of notes. The book will be found valuable as a collection of authorities. The old discussion as to custom as a source of law has lost most of its significance since the discovery of the general fact that in primitive communities custom is always antecedent to law, and that the conception of law as a command issuing from a sovereign authority, with a sanction annexed to it, is a modern conception, almost unintelligible in communities such as, for instance, those of the East, where custom still regulates family and individual life. In our law, custom is chiefly invoked to alter or modify the general rules of jurisprudence, and no one can look over Mr. Lawson's book without becoming convinced that this tendency is capable of dangerous abuse. Attempts are continually made in the courts to nullify elementary rules, not merely of the law, but of positive morality.

One or two amusing instances of this are given by Mr. Lawson. In the Court of Common Pleas in London, in 1860, an attempt was made to introduce evidence of a usage among undertakers to charge the original cost of the articles used at any funeral, although they might be used at other funerals and thus paid for over and over again. Mr. Justice Keating, who tried the case, allowed the evidence to go to the jury, but told them if they considered the custom unreasonable or unrighteous, they ought not to found a verdict upon it; and their verdict, accordingly, was for the defendants. In another case, the late Mr. Justice Maule illustrated the principle of law that a custom must be reasonable as follows: "It is a usage in the strawberry business to put all the large strawberries at the top of the pottle and all the bad ones at the bottom; but that would be hardly a fair custom as against a customer who had bought a fair pottle." In a case very recently decided in the Court of Appeals in this State, a principal sued a broker for deceit in making representations as to the solvency of a customer in the cigar business. The defendant,

for the purpose of showing that the deceit did not influence the action of the plaintiff, was permitted to prove by persons engaged in the tobacco trade that, by the custom of the tobacco business, no reliance whatever is placed by manufacturers and sellers upon the representations of the brokers employed to make sales, in respect to the credit of persons from whom orders are procured. The Court of Appeals thought that such evidence was not admissible, and said:

"Evidence of the custom of a particular trade is admitted to supply what is not expressed, or to explain what is doubtful, upon the presumption that persons engaged in a particular trade are acquainted with, and understand and tacitly assent that their contracts shall be interpreted in the light of, the recognized usages of the trade. But there is no ground for this presumption where the usage attempted to be shown is repugnant to common sense, or is based upon a disregard of the relations which exist between men or the duties which in law or morals they owe to each other. The broker was bound to the utmost fidelity in the business of his employers. His relation to them was such that naturally his representations in respect to the commercial credit and pecuniary ability of his customers would carry weight and influence. He was bound in law and in morals to make no representation which he knew to be false, and to conceal nothing which he should learn in the course of his employment which it was for the interest of the plaintiffs to know. The plaintiffs, on their part, had intrusted him with their interests. They, of course, would take notice of the fact that the broker was interested to earn his commissions; but they had a right to assume that representations made by him in the course of his employment would be truthful. The custom and usage which was allowed to be shown proceeds upon the theory that a broker in the tobacco trade is unworthy of the confidence of his employer, and that this is so well understood that it has become the rule of the relation between them that the employer ignores and disregards the representations of the broker upon the vital question of the financial credit of customers, although the representation was made in the course of his duty. It was competent for the defendant to show that the plaintiffs did not, in fact, rely upon, and were not influenced by, the representation contained in his letter; but this could not be shown, we think, by proof of a custom or usage in the tobacco trade."

Mr. M. M. Bigelow's first American edition of W. Blake Odger's 'Digest of the Law of Libel and Slander' (Boston: Little, Brown & Co. 1881) is, like all Mr. Bigelow's editions of standard works, carefully prepared. His power of statement is not very great, but his industry and accuracy are always commendable. The book as a whole should be considered, as it purports to be, rather a digest than a treatise. It is full of curious learning, of one kind and another, of great interest to all classes of the community. At page 9 we find a definition of libel and slander taken from the Civil Code of the State of New York, as if that remarkable body of law had been enacted by the Legislature. It may be worth while, as the adoption of the Code is now pending, as usual, at Albany, to call the attention of the gentlemen interested in the matter, and of Mr. Field, to the fact that a more preposterous definition of libel and slander was never put together in half a dozen lines. By it, libel is described as a "false and unprivileged publication, by writing, printing, picture, effigy, or other fixed representation to the eye, which exposes any person to hatred, contempt, ridicule, or obloquy, or which causes him to be shunned or avoided, or which has a tendency to injure him in his occupation"; while slander is defined to be

"a false and unprivileged publication, other than libel, which (1) charges any person with crime, or with having been indicted, convicted, or punished for crime; (2) imputes in him the present existence of an infectious, contagious, or loathsome disease; (3) tends directly to injure him in respect to his office, profession, trade, or business, either by imputing to him general disqualification in those respects which the office or other occupation peculiarly requires, or by imputing something with reference to his office, profession, trade, or business that has a natural tendency to lessen its profit; (4) imputes to him impotence or a want of chastity; or (5) which, by natural consequence, causes actual damage."

Does libel necessarily depend "on fixed representation to the eye"? Under this section of Mr. Field's Code, a publication printed in raised blocks for the blind would not be a libel. Again, a libel need not necessarily be false; a cartoon in a comic paper may be libellous, without there being the slightest falsehood in it. To say of a man "that he is an honest lawyer" has been held to be libellous, but it would be very difficult to make it so under this Code. Slander, on the other hand, is not a "publication," and its subdivisions in Mr. Field's Code are not recognized in any of the standard works on the subject. As Prof. Dwight recently pointed out in the *Nation*, there is something ludicrous in the idea that a mistaken report that "so-and-so has scarlet fever" would expose any one repeating it to an action of slander. These subdivisions have been introduced as if dependent on distinctions in substantive law, when in reality they relate simply to the damages which can be recovered by the person slandered. The two sections, taken together, are not in any sense a statement of law as it exists anywhere in the civilized world.

The distinctions between libel and slander are, in our system of law, very numerous, and not by any means rational. The law of slander grew up in the community without much direct interference from the Government, while the law of libel, coming in with the introduction of printing, derived its early severity from the desire of the Government to prevent freedom of speech. In slander, except in a few special cases, the plaintiff has to prove actual damages. In libel he has to prove merely publication. Some of the results of this distinction are very extraordinary. Thus, to accuse a man of fraud, dishonesty, immorality, or any vicious, dishonorable, or criminal conduct is not actionable, unless it has produced as its natural and necessary consequence some pecuniary damage to the plaintiff, and he can prove this. The following species of abuse may be indulged in with almost perfect safety. Any one may talk of his neighbor as "a scurvy, bad fellow," "a rogue," "a villain," "a varlet," "a common filcher," "a cozening knave," "a welcher and a swindler," with little danger. It appears from the decisions, too, that he may add, "I know enough about you to hang you," "you cheated your brother-in-law of upwards of ten thousand dollars," "you cheat everybody," without much greater risk. On the other hand, it is libellous to publish of a man that "he is an infernal villain," "an impostor," "a hypocrite," "a frozen snake," "a rogue and a rascal," "a dishonest man," "a mere man of straw," "an itchy old toad," "a desperate adventurer, association with whom would inevitably cover gentlemen with ridicule and disrepute," that "he grossly insulted two ladies," that "he is unfit to be trusted with money," that "he is insolvent and cannot pay his debts," that "he was once in difficulties," that he is "the most artful scoundrel that ever existed," "is in every person's debt," that "his ruin cannot be long delayed," and that "he is not deserving of the slightest commiseration." The ground usually stated by the courts for the distinction between libel and slander is, that a libel is more likely to lead to a breach of the peace than spoken words; but this is one of those explanations invented by the courts to justify the rules of law actually existing, and is of little or no historical value.

RECENT NOVELS.

One May Day: A Sketch in Summer Time. By Miss Grant. New York: Harpers.

A Heart's Problem. By Charles Gibbon. New York: Harpers.

God and the Man: A Romance. By Robert Buchanan. New York: Harpers.

Esau Runswick. By Katherine S. Macquoid. New York: Putnams.

Joseph's Coat. By David Christie Murray. New York: Putnams.

The Dingy House at Kensington. New York: Putnams.

Eunice Lathrop, Spinster. By Annette Lucile Noble. New York: Putnams.

John Eax, and Mamelon; or, The South without a Shadow. By Albion W. Tourgée. New York: Fords, Howard & Hulbert.

The Senior Partner. By Mrs. J. H. Riddell. New York: Harpers.

Benvenuta; or, Rainbow Colors. By Emma Marshall. New York: E. P. Dutton & Co.

The Four Macnicols. By William Black. New York: Harpers.

The Burgomaster's Wife. By Georg Ebers. From the German by Mary J. Safford. New York: W. S. Gottsberger.

Aspasia: A Romance of Art and Love in Ancient Hellas. By Robert Hammerling. Same translator. New York: W. S. Gottsberger.

John Inglesant: A Romance. By J. H. Shorthouse. London and New York: Macmillan & Co.

Of the eight stories which head our list, Mrs. Macquoid's is easily the best. None of them presumes to be of the first rank, but all are pleasing enough to repay brief reading. 'One May Day' is in Miss Thackeray's manner, though the author lacks her resources for setting and accessories. 'A Heart's Problem' has a heroine with a double, and her woes are due to the disappearance of one of those letters which, for the benefit of the makers of plots, have been going astray ever since novel-writing began. 'Eunice Lathrop' has some incidents so sensational that we should have passed it by but for the very pretty sketching in the earlier chapters. The pictures of the life of the country minister and his daughter are very delicate, and to interleave them with the suicide of an adventuress is like throwing sweet wild flowers into the dirt and grime of an ash-heap. 'Esau Runswick' is a tale, half French, half English, of an old man cramped and embittered by early disappointment, but won back to forgiveness and charity at last by the loving tenderness of his niece. Mrs. Macquoid has plenty of materials with which to fill in the details of her work, so that there is little excuse for such careless heaping together as in this description of a lady's boudoir: "On the walls and about the room were Venetian and Florentine mirrors; carvings in ivory and wood from Nuremberg; Dresden figures and Sevres cups and saucers; Japanese bronzes; Oriental rugs and chair-coverings; Chinese curios—almost every part of the world had paid its tribute to the beautiful little room." It is a cheap way of producing an effect, to which it is time to object, as it is now too often repeated. What is it better than an appraiser's list or an auctioneer's catalogue? We were about to turn to Miss Thackeray for an example of what the picture of an interior ought to be to give the reader a sense of individuality, but a bit turns up nearer to our hand in 'Eunice Lathrop.' Perhaps it is all the better for an illustration in that it is intrinsically worth nothing. It has, however, a character of its own, and does not

sound like a mere copy of a newspaper advertisement. It is the spinster's sitting-room :

"A multiplicity of foam-white tidies bubbled up over the surface of her sofas and chairs. The rainbow parasols of grotesque celestials hung from her gas-fixtures, arabesques of autumn leaves meandered artistically around the hieroglyphics of presumably pious texts, and all the surroundings were suggestive of a fancy bazaar. What if every fern, every illumination, every wretch of a tidy put in the eloquent plea of 'Stay at home with us, Miss Eunice !'"

'God and the Man' has been heralded as "so powerful, so dramatic," but the reader will not reach the second half without the conviction that it is like the power of a man who has shouted himself hoarse. The theme is implacable, undying hate. The writer has chosen somewhat the same path as that of the 'Wreck of the *Grosvenor*' books ; but he is decidedly ahead in that he has conceived the idea of setting afloat in mid-ocean not only a pair of lovers, but also the disappointed suitor, who, by way of revenging himself, has set the ship on fire. He that has breath to follow, will have his fill of icebergs, starvation, and desolation. The end ought to be impossible : that the pious, gentle Priscilla should still love with "a great joy" this wild Berserker, even while he is confessing, "He perished through my hate ; that guilt is on me." But who shall say what a woman may not have done ?

'John Eax' and its companion story 'Mamelon' can hardly add to the literary reputation of their author, though he is surely entitled to the credit of his good intentions. "If the North and South are contrasted, it is but to show the fusing potency of love, or the solvent power of manly friendship." These short stories were written prior to the books which have made his name famous, and their publication is doubtless only another instance of the eagerness of publishers to put forth anything that carries the prestige of a previous success. To say they had better have been left in obscurity, is not to deny the merit of some of the descriptions of both scenery and character. The second story has, in the form in which it is cast, an unpleasant improbability. On St. Valentine's Day, to "a group of merry girls, with fair, light eyes and restless, eager ways," a wife still young is supposed to narrate the history of her married life, culminating in the attempt of her husband to commit suicide in order to obtain a life-insurance, to save her from poverty. Thanks to a timely fit of apoplexy, he misses his aim. Whether this last makes the story itself more likely or not, it certainly makes her telling it to such an audience, upon a three weeks' acquaintance, the more curious.

'Joseph's Coat' is a suggestive title, but it has a slender connection with the story, being only a garment in the lining of which are lost the "marriage lines" of Dinah Banks. *Hinc illæ lacrymæ*, and a wonderful winding in and out of plot, till, in the depths of a coal-mine where she is buried by an explosion, her husband—a returning prodigal of the better sort—finds her at last. The incidents border upon the extravagant, but there is a homely frankness about the characters, both good and bad, that gives reality to the story.

We commend 'The Senior Partner' as a novel that will last—no small recommendation to people of busy brains, who turn to a novel for refreshment on the same principle that they go to see a good comedy. It is so solidly, carefully done, that there is no temptation either to skip it or skim it. It is in this respect more like Trollope's work than we should have supposed a woman's could be. Much of it has that same photographic fidelity. Robert McCullagh—"plain auld Rab"—is the head of a commercial house in London, but one where everything is Scotch—"deeply, darkly, beautifully Scotch." His one virtue is his unswerving honesty, as, cold of heart and hard of head, he makes his loveless way to fortune. Such a man must needs be harsh to his children, and the plot deals mainly with his injustice to his son Robert and the heaping of coals upon his head by Robert's noble wife. But the interest is less in that side of the story than in the contrast between McCullagh and Pousnett, who is the veritable "Senior Partner." The contrast is never obtruded, but left to impress itself on the reader's mind in the development of events : Rab, always crabbed, repellant, grasping, but always with the fine fibre of strict honor in his nature ; Pousnett, winning, suave, plausible—speaking never a falsehood, but, equally, speaking never the truth.

'Benvenuta' is a faintly entertaining story, which would not require mention were it not for the conspicuous "Home Reading for Girls" upon the cover. An older person would see at once the unreality, and the silliness that comes hard upon vulgarity, but young girls might not detect its absurdities. Benvenuta writes a novel between bedtime and ten o'clock next morning, of which three editions are published, and Netta paints thousand-dollar pictures for the Academy. The most objectionable part of the book is the story of the second marriage of Benvenuta's father. Mrs. Powis is not at all the cruel stepmother, and the grown-up children have no recollections of their own mother; but the lady's folly and Benvenuta's righteous indignation are worked up in a way to be painful if real, yet are here only ludicrous. Outside of questions of absolute principle, there is probably nothing about which preconceived notions in a girl's mind can do more to destroy happiness, most of all her own, than this matter of a father's second marriage. Because of its false teaching in this regard, the book is positively to be condemned.

'The Four Macnicols' is only a bit of a sketch, which the reader will wish were longer, of brave, hearty Scotch fisher-lads to whom sixpence is affluence, and a shilling a fortune. It has in it all the best traits of Mr. Black's work, and the peculiar charm with which he always depicts life upon the sea. It has, too, a special wisdom, in that the boys work their way up in a natural manner. No miraculous discovery, no prodigy of benevolence smooths the path for them ; they make their own modest fortune with only such help as diligence and perseverance may expect.

It is doubtful if in all historical writing there is any episode of which it is oftener said, "It reads like a story," than of the chapter in Motley's 'Rise of the Dutch Republic' entitled "The Drama of Leyden." To compare it page by page with 'The Burgomaster's Wife' will only prove the superiority of the history in clearness, vividness, and, withal, nobleness. Nor is this to disparage the novel, which presents a stirring picture of that stormy time when Leyden stood a desolate, but steadfast, witness for the Protestant faith. Both historian and novelist have selected the same incidents, and even to minute details, so far as real facts and persons are concerned, the novel might have been made up solely from the pages of Motley. The women and children whom Ebers has introduced in the families of the burgomaster Van der Werff and his friends are gentle, gracious figures, and at any other time their love and fidelity would strongly appeal to our sympathy. But such feeling is already so strongly excited by the horror of the situation, that the ordinary material of romance seems impertinent. One regrets that the space given up to it had not been devoted to a fuller account of what was going on outside of Leyden—the successive stages by which the country was flooded, and that marvellous voyage of the fleet of deliverance, instead of leaving it to be just hinted at in the broken story of one of the sailors. We are conscious, however, that this is more of a loss to German readers ; for to an American any version of it after Motley's would seem a story at second hand.

'Aspasia' belongs to the same series of translations, of which we may say in passing that they are very attractive in their make-up. To do justice to the author, he may speak for himself from his preface, first as to romance-writing itself :

"Philosophers are right in asserting that the idea never merges wholly into reality. The poet of tendency pursues it to a high point of its development, holds it forcibly at a spot which it really only touches in passing, makes it shimmer and sparkle for the pleasure of mortals, and converts the soap-bubble into the fixed star. Pure, unpremeditated poetry, on the contrary, accompanies the idea on its way to realization to the spot where, to restore itself to its former purity, phœnix-like, it delivers itself to a fiery death."

Of this romance in particular he says : "It not merely contains, in a positive form, beautiful sensuality glorified by intellect, in its development, prime, and decay, but the conflict between the æsthetic and moral ideal of existence arises, and is decided in the life of an individual and the destiny of a nation." The obscurity of the first statement may be the fault of the translator, but there can be no doubt of the tone of the second. To justify the picture by its truthfulness would be beside the mark. No one but the special student of the history of morals has any concern with that aspect of the life of antiquity. None of the arguments which are advanced in defence of the representation in fiction of the corruption of modern life have any weight in a case like this. Here, if ever, the past should be left buried with its dead. The book is useless as a study of art. It is a book of information rather than of learning. Of the stories, much is made of one so trite as the acanthus leaves on the grave and the Corinthian capital, and Aspasia repeats at length the school-book dialogue of the better garment and the better husband. All the real effort of the book has gone to the portrayal of scenes of wanton luxury and pleasure, while much that might have been in the original only repelling is here made repulsive by the lack of delicate shading in the translation. A pessimist would need no better text for a lament over the downward tendency of modern fiction than the contrast between this book and the grave, severe beauty of Landor's 'Pericles and Aspasia.' Judged by a literary standard only, there is deeper tragedy in the calm, slow words which Landor gives to Pericles, "I am living in a city of tombs and torches, and the last that I saw before me were for my children," than in the whole chapter of fevered realism which describes the plague in Hammerling's book. Morally, the two works are as far apart as a Greek tragedy and a play of Dumas, *fils*.

'John Inglesant' is in form the biography of a gentleman of the seventeenth century, "sometime servant to King Charles I.," trained, though in secular life, by the Jesuits, in order the better to be their agent between all religious and political parties in England. The book, one might say, is an epitome of the literature of that time. Here are pages from Evelyn's diary, episodes from Gramont, a chapter from the 'Leviathan,' and the dreams of the Quietists. It is made up ostensibly from papers found at the country-seat of an old Catholic family, and some want of skill in form prevents the reality of effect which the writer intended. On one page we are told even the dreams of Inglesant. On the next, the parenthentic "as it appears," "it would seem probable," destroy all illusion. There is no

plot in the sense of mutual influence of the characters one upon the other, but by the single connecting-thread of the hero's personal experience a long train of famous figures are marshalled before the reader, while the political history and the religious controversies of the time are alternately brought forward by Inglesant's occupation in important and delicate diplomatic missions, and by his search for the true philosophy of life as he successively comes in contact with the leading thinkers of his day. It would not be quite just to call the book too ambitious, or its flight too high, but it attempts to cover too wide a field to permit the highest success. The English part of it is less interesting, less vivid than the Italian. The first volume has many passages that are flat and tame. Witness this of a grand pageant, the English Queen and all the court on the river: "He never forgot the sight to his dying day, and it was doubtless one to be long remembered by those who saw it for the first time." The chapters devoted to Italy, on the other hand, are full of exquisite descriptions of nature, in which are set episodes of deep feeling and lofty exaltation. The vision of the blind friar is a prose poem that reads like Milton's rolling verse, and yet it is as simple as the hymn of a child. The reader may take large exceptions, but there will still remain what must make the book a permanent addition to the store of romantic fiction.

THE ST. LOUIS BRIDGE.

A History of the St. Louis Bridge; containing a full account of every step in its construction and erection, and including the theory of the Ribbed Arch and the tests of its materials. By C. M. Woodward. St. Louis: George I. Jones & Co.; New York: D. Van Nostrand. 1881.

AFTER the lapse of more than seven years since the completion of the great bridge across the Mississippi River at St. Louis, an historical description of its construction is given to the public by Prof. Woodward, who, though not associated with the building of the bridge, was an eye-witness of all the principal operations. His book is understood to have been prepared at the request of the chief engineer, Mr. James B. Eads, whose written approval accompanies it. The author is not an engineer, but Professor of Mathematics in Washington University, and this circumstance perhaps adds to the value of his narrative, which is sufficiently technical and minute to meet the wants of the professional reader, and at the same time shows the work somewhat as viewed by a layman, and will be readily understood by any careful reader.

The first proposition for the erection of a bridge across the Mississippi River at St. Louis came from Mr. Charles Ellet, jr., in 1839. He proposed then to cross the river with a suspension-bridge having a central span of 1,200 feet, and two side spans of 900 feet each. It was before the days of railroads, and the city fathers stood aghast at the enormous estimate of cost—a little less than three-quarters of a million dollars, or about one-ninth the cost of the structure described in this volume. It was not till after the war that the scheme for a bridge began to take practical shape. Colonel Ellet was no longer alive; his brilliant career had closed in the successful first attack made by the gunboats which he had himself designed on the Mississippi River. In 1867 the time seemed to have come for operations really to begin. Strangely enough, after nearly thirty years of inactivity, two rival companies appeared in the field: one was regularly organized under the laws of Missouri, and included among its managers several eminent citizens of St. Louis; the other claimed an exclusive right under a charter granted by the State of Illinois, and was controlled by a well-known bridge-builder of Chicago. The plans proposed by these two companies were strikingly unlike. Mr. James B. Eads was the chief engineer of the St. Louis company; Mr. Boomer was manager of the Illinois company. The location selected by the Missouri company was at the foot of Washington Avenue, where the width of the river at ordinary stages is but little over 1,500 feet; and the plan consisted of three steel arches, each 500 feet long, supported by two masonry piers in the river, and an abutment on each shore. All the foundations except that of the east abutment were to be sunk to the rock, which was known to be nearly ninety feet below low water at the site of the east pier. The Illinois company, on the other hand, had selected a location about half a mile above, and proposed to build an iron truss-bridge, the longest spans of which should be 350 feet, supported by piers formed of cast-iron columns, those nearest the Missouri shore to be sunk to the rock, and those on the east side bedded in the sand fifty or sixty feet below low water. For a time the contest between these two companies was very sharp, though confined principally to the newspapers and the courts. In March, 1868, this controversy was terminated by the nominal consolidation of the two companies, and the actual absorption of the Illinois company by its rival, to which the former had sold out.

On the 20th of August, 1867, ground was broken for the foundation of the west abutment. On the 25th of February, 1868, the first stone was laid. The work remained, however, in a state of inactivity till the early part of 1869, when enough money had been raised to justify an earnest start. Up to this time the bridge had been by many regarded as a work of doubtful possibility, and the plans, especially those of the foundations, were by no means matured. These plans had contemplated the construction of immense iron curbs, of circular or elliptical form, which were to be sunk to the rock by dredging the sand from the interior, after which the masonry was to be built in a floating pontoon inside the curb and allowed to sink gradually by its own weight to the rock foundation below. Before work was begun this plan was entirely abandoned, and it was determined to use the plenum-pneumatic process, which, though in general use abroad for nearly twenty years, had been applied only on a small scale in this country. For the benefit of the non-professional reader, a brief description of this process may not be out of place. It is simply the application of the diving-bell to foundations of large size. A caisson is first constructed of the full size of the foundation; this caisson has sides and roof, but no floor; the water is excluded by pumping air in, and the open bottom enables the workmen to excavate the material below. As the water is excluded simply by the pressure of the air, this pressure must always exactly balance the pressure of a column of water the base of which is at the bottom of the caisson; the caisson must therefore be made absolutely air-tight. For entrance and exit a small chamber called an air-lock is provided. The air-lock has two doors, one opening into it from the outer air, the other opening from the air-lock into the caisson. A person going into the caisson enters the air-lock and closes the door, the air-pressure being simply that of the normal atmosphere. He then opens an equalizing valve, which allows the compressed air of the caisson to enter the air-lock, and when the air-pressure in the lock has increased so as to balance that in the caisson he opens the door leading into the caisson and enters it. The reverse process is used in coming out. The caisson is placed at the site selected for the foundation of a pier, and the masonry of the pier is built on top of it; when it reaches the bottom of the river, laborers are set to work in the caisson to dig out the river-bed, and as they excavate, the caisson sinks. This work is continued until a satisfactory bottom is reached, the laying up of masonry continuing all the while. When the sinking is completed, the caisson is filled with concrete or other material, making a solid mass of the whole pier. This increase of air-pressure in the caisson as the depth becomes greater is equivalent to about one atmosphere for every 35 feet of submersion.

Never had the pneumatic process been applied anywhere in Europe on a scale like that of the foundations of the St. Louis bridge. The caisson required for the west pier was 82 feet long and 48 feet wide, and was to be sunk 60 feet below ordinary low water. That for the east pier was 82 feet long and 60 feet wide, and had to be sunk 90 feet below ordinary low water. This—which was nearly 30 feet deeper than the deepest foundation ever put in by this process—involved working in over 100 feet of water, under a pressure of about four atmospheres.

The magnitude of these foundations was perhaps enough in itself to make the work original, but several novel details were introduced which added greatly to the efficiency of the undertaking. The air-locks, which had hitherto been placed at the top of long shafts and shifted as the depth increased, were immovable below the roof of the caisson. A very efficient excavator was devised by which the sand was carried off by a column of water forced through pipes by a pump outside. The sinking of these two great foundations was a remarkable triumph of engineering. No serious mishap occurred, and the work was carried on with extraordinary rapidity. In the last 20 feet of the east pier, however, the great pressure began to tell on the men. Its effect was very imperfectly understood; doctors differed while the men suffered. In the caisson no trouble was experienced, but in several instances, soon after returning to the normal atmosphere, men were attacked by a kind of paralysis, which sometimes resulted in speedy death. The length of a working shift was reduced to one hour, the men working twice a day, and the foundation was finally completed.

The success of these two foundations was such that it was determined to sink the east abutment also to the rock, albeit about 100 feet below ordinary low water. Special care was taken to avoid all the difficulties which had been experienced in the east pier; better ventilation was secured in the caisson; an elevator was provided to take the men up and down; lamps connected with special outlet pipes avoided the smoky atmosphere made by burning candles; special attention was given to the care of the men when working at great depth. The results told well: out of fourteen deaths which occurred from the effects of compressed air, only one occurred at the east abutment, and this one was plainly traceable to imprudence. In April, 1871, the last foundation was completed.

From this time forward interest centres in the construction of the three steel arches. This was an undertaking quite as bold as the foundations, and more original. Although the appearance of the St. Louis bridge is not unlike that of the bridge over the Rhine at Coblentz, which may have suggested the ribbed arch for St. Louis, the details of the construction, the material used, and the methods of erection were radically different; and the spans of the St. Louis bridge are more than one-half greater than those at Coblentz. From the start it was determined to make the arches of steel. Steel manufacture ten years ago was very different from what it is

now. It is still far from perfect, but any good, open-hearth furnace could now furnish promptly a material which was obtained only after repeated rejections and difficulties ten years ago. It is hardly too much to say that the steel arches of the St. Louis bridge involved the construction of a new material, the invention of new machinery for their manufacture, and a boldness in their erection commensurate with the other novel features. These arches, the central one of which has a clear span of 520 feet, were built out from the piers and abutments without false works, supported partly by their anchorage to the masonry, but principally by chains attached to temporary towers above the piers. In January, 1874, the last arch was closed. The work now went on rapidly to completion, and the end of June saw the St. Louis bridge virtually a completed work. On the 2d of July, 1874, nearly seven years after the breaking of the ground for the foundation of the west abutment, the finished structure was finally tested.

Seventeen chapters are devoted to the historical description. Eleven more are devoted to special subjects. To the professional reader these eleven chapters are the most valuable; the earlier chapters may be better appreciated by the layman. Chapter xxii., which treats of the physiological effects of compressed air, is perhaps the most remarkable. Prof. Woodward gives an exhaustive description of the sufferings of the workmen in the caisson of the east pier, of their treatment and of the opinions of the attendant physicians, and adds to this his own views, which, though differing from medical authorities, seem supported by excellent reasons. He attributes the injury to the men principally to the great loss of heat experienced in passing rapidly from a pressure of three or four atmospheres to that of one; and he suggests that, in addition to the improvements used at the east abutment, special provisions be made for warming the air-lock used for exit, and for artificially supplying to the men the heat which rapid rarefaction of the air deprives them of. Any person who has experienced the chill of an air-lock on leaving a caisson, and the gratifying warmth of a hot cup of coffee immediately thereafter, will appreciate the wisdom of Prof. Woodward's suggestions.

One of the longest chapters in the book, chap. xxv., is devoted to the experiments made to determine the strength of materials. Seven years ago the information it gives would have been very valuable; now it is one of the most disappointing parts of the book. The reports of the tests of steel give the elastic limit, the ultimate strength, and the modulus of elasticity, but they fail to note, except in a few instances, the stretch of the sample before fracture, and the character of the fracture—two features which are now considered quite as important as mere strength in determining the adaptability of metals to structural purposes. Tables like these are principally valuable in determining the requirements which an engineer should ask for in new works. Although now published for the first time, they have been superseded by later experiments, and give little indication of the class of material which an engineer would now seek to obtain.

The book bears in its pages the marks of honesty: it records the failures as well as the successes. No great work has ever been completed without drawbacks; the St. Louis bridge was not, and Prof. Woodward does not pretend that it was. He relates the failure of the attempt to fit the last tube into the arches, and the final adoption of an adjustable tube which could be lengthened after being put in place; and he does not conceal the fact that after the closing of the two middle arches of the western span a tube was broken in each of them. The cause of the fracture was subsequently explained, and the broken tubes replaced by new ones. It is not probable that the St. Louis bridge will ever be copied: improvements in manufactures have in nothing been more rapid than in those materials which enter into bridge construction. Nevertheless, its construction has been of immense value to the engineering profession. It has shown, in a manner previously unknown, the great resources of the plenum-pneumatic foundation process, which has since been used to found the great piers of the East River bridge, and has come into general practice on the silt-bearing Missouri. It was the pioneer of steel-bridge construction.

The book has a full analytical table of contents, and an excellent alphabetical index. Two defects, however, may be mentioned. There is no general description of the whole subject; and a preliminary chapter devoted to this purpose would be of no little assistance to the reader to whom the history of this bridge is wholly new. The frequent reference to dates in all parts of the volume is generally made without giving the year; and though this may be determined by looking back a few pages, it is somewhat confusing in a narrative which runs over a period of seven years. On the whole, it is perhaps not too much to say that Prof. Woodward's volume is the most valuable work of its kind which has yet appeared in America; and it is gratifying to be able to add that the typographical execution is worthy of the book. Besides numerous woodcuts in the text, there are thirty-nine lithographic plates of unusually good workmanship, the value of which the professional reader well knows, and eleven reproductions of photographs, the most interesting of which represent the work during construction.

Harper's Popular Cyclopœdia of United States History. From the Aboriginal Period to 1876. By Benson J. Lossing, LL.D. New York: Harper & Bros. 1881. 2 vols. 8vo, many illustrations.

Mr. Lossing has not heeded Macaulay's injunction to his index-maker, to confine himself almost exclusively to proper names. This, we may admit, was neither practicable nor desirable in a work like the present; but the case still clearly called for the science of the dictionary-cataloguer as well as for the learning of the historian. Hence, what first strikes us in turning these pages is the extraordinary nature of some of the titles, as will appear from a few examples. *Amphibious Warfare* is not exactly a popular heading which it would occur to any one to consult. *Ancestors of the Pilgrims* is a hardly more rational rubric. And what shall we say of *Emancipation of Ireland* (as the result of the American War of Independence) except that it is tolerably far-fetched; of the *Navy Quickly Created;* and of the *March of Public Sentiment!* This last title refers to the progress made in amending slavery out of the Constitution within twelve years after the Dred Scott decision. Mr. Lossing himself might be cited in illustration of the same theme. In 1868 he published 'A Pictorial History of the United States, from the Earliest Period to the Present Time,' in which no notice was taken of the anti-slavery movement in any shape before 1850, nor any mention made of the Liberty Party, or of the Free Soil Party before 1856. Now, in the march of his sentiment, he has articles on the *Abolition Convention* (of 1794) and on *Anti-Slavery Champions in Massachusetts* (in 1766), *Anti-Slavery Societies* of the last and present centuries, etc., with portraits and biographies of the leaders, and gives a place to John G. Birney (though not to John P. Hale), to Frémont, Sumner, Wilson, etc. This, albeit there is no *Abolition of Slavery* (one must look under *Emancipation*), indicates some progress in a little more than twelve years. We remark in passing that the American Anti-Slavery Society was founded not in 1832, but in 1833, and that its first President was Arthur Tappan, a name whose omission from a dictionary which includes George Peabody (not more princely and not so philanthropic a giver) leads us naturally to speak of some other omissions.

The historian Gibbon finds a place because he was a paid writer against the Colonies, but neither his 'American Notes' nor his two visits to this country entitle Dickens to admission; nor her 'Society in America,' Harriet Martineau. Kossuth is recognized, but not George Thompson, whose tour here was attended with vastly greater consequences to "American history." So the enthusiasm for phrenology which greeted Spurzheim and Combe, and the temperance furor excited by Father Mathew, should have brought these eminent men within the scope of Mr. Lossing's work. Sylvester Graham, for his lasting influence on the American diet, and Samuel Thomson for his medical school, were as significant factors in shaping or developing or illustrating our national character as was William Miller, the prophet of the Adventists. J. H. Noyes and the Perfectionists go wholly unrecognized; nor is the late head of the Oneida Community alluded to, even as their historian, under *Communistic Societies.* Oneida, Rappites, and Dunkers are all neglected in the alphabetical arrangement. Robert Owen is discoverable, but not Frances Wright. Mrs. Stowe being lost to view, like her father, it is not surprising that Mrs. Frances Ann Kemble shares their oblivion; but it is strange that Forrest should be wanting, even if Macready is.

Here we touch upon another curious phase of this work. The Astor-Place riot is one of the landmarks in American history. It is not mentioned. There is a generic title for *Riots,* but the instances are all Revolutionary, as if there had never been any since. *Mob in Baltimore* (1861) is the only other confession of American lawlessness; but of the famous Boston mob of 1835, nothing; of the Alton riot of 1837, so profound in its effect upon Northern sentiment toward slavery, nothing, nor is Lovejoy known to Mr. Lossing; in short, of any anti-abolition mob, nothing. This is all the more remarkable because these related distinctly to freedom of speech and of the press, to which the Cyclopœdia gives three titles, pertaining, however, wholly to the past century. One of these, *Freedom of the Press in Massachusetts* (1721), is a striking commentary on the failure to record the name and trial of Abner Kneeland.

The truth is, that we have some reason to be grateful that Mr. Lossing has not construed the term history as applicable solely to naval or military persons and events. "O que j'aime les militaires!" might almost be taken for the motto of a work which is silent as to Corwin, Giddings (even in connection with the Seminole War), and Gerrit Smith, and gives five titles to Francis Marion, as many to Frémont, and one to General Badeau. Yet under *Meade* there is no reference to Gettysburg. Benton's duel with Jackson, like his subsequent reconciliation with the President and ardent support of his war on the United States Bank, is overlooked. Calhoun's quarrel with his chief when Vice-President in 1832 was more important than many a battle-field not forgotten by Mr. Lossing. Political parties are sometimes not at all, or not skilfully, included. The Barnburners shine by their absence, and Know-Nothings must be

sought, without a cross-reference, under *American Party.* Instances such as these last show how much the value of this Cyclopædia is impaired as a work of reference for young political students puzzled by names which have fallen into desuetude. Apparently, in the design of its author, it was to be read through consecutively, though even this hypothesis fails to explain the ordering of titles in such a way as to introduce an episode of a man's life—*e.g., Marion and the British Officer*—before his biography proper is reached.

It would be easy to continue to point out shortcomings, but we might end by seeming to undervalue this laborious and useful compilation. For the Revolution and the Rebellion and the two intervening wars it will be found especially serviceable; much less so for the political movements of the present century; scarcely at all for the social progress. Its plan, as we have seen, must not be scrutinized too closely, and one must take it for what it offers. We can specify the chronology of the *Minor Events of the Civil War*, the twenty-eight titles under *Slavery*, and that devoted to the *Peace Congress*, among others, as being extremely convenient for consultation. The illustrations are in Mr. Lossing's familiar style, and have the merit of being realistic (at least in intent; the execution, as in some of the portraits, occasionally falls short), and seldom purely imaginative. The facsimile of Lincoln's Emancipation Proclamation is typical of the principle of selection.

BOOKS OF THE WEEK.

A Tallahassee Girl. [Round-Robin Series.] Boston: J. R. Osgood & Co. $1.
Audsley, W. and G. Popular Dictionary of Architecture and the Allied Arts. Vols. i. and ii. New York: G. P. Putnam's Sons.
Chandler, H. W. Practical Introduction to Greek Accentuation. Revised edition. Oxford: Clarendon Press; New York: Macmillan & Co.
Cluer, A. R. Livy: Books v., vi., and vii. Oxford: Clarendon Press; New York: Macmillan & Co.
Collins, W. L. La Fontaine, and Other French Fabulists. Philadelphia: J. B. Lippincott & Co. $1.
Crake, A. D. The Rival Heirs. New York: E. & J. B. Young & Co. $1.
Culross, J. William Carey. New York: A. C. Armstrong & Co. 75 cents.
Foye, J. C. Tables for the Determination, Description, and Classification of Minerals. Chicago: Jansen, McClurg & Co. $1.
Fuller, A. W. Artistic Homes in City and Country. Boston: J. R. Osgood & Co. $3 50.
Gautier, T. One of Cleopatra's Nights, and Other Fantastic Romances. New York: R. Worthington. $1 75.
Genji Monogatari: the Most Celebrated of the Japanese Classical Romances. London: Trübner & Co.
Glascock, Mary W. Dare. San Francisco: California Publishing Co.
Goff, May Perrin. The Household: a Cyclopædia of Practical Hints for Modern Homes. Detroit: *Free Press* Co.
Gordon, G. H. A War Diary of Events in the Great Rebellion, 1863-1865. Boston: J. R. Osgood & Co. $3.
Habberton, J. Mrs. Mayburn's Twins. Philadelphia: T. B. Peterson & Bros. $1.
Havergal, Frances Ridley. Set Apart, and Other Poems. Hand-Painted. New York: A. D. F. Randolph & Co.
Hawley, J. G. American Criminal Reports: Latest Cases in Federal and State Courts. Vol. iii. Chicago: Callaghan & Co.
Her Picture. [No-Name Series.] Boston: Roberts Bros. $1.
Hicks, E. L. Manual of Greek Historical Inscriptions. Oxford: Clarendon Press; New York: Macmillan & Co.
Holland, T. E. The Institutes of Justinian. Oxford: Clarendon Press; New York: Macmillan & Co.
Lecocq, C. Manola: opéra bouffe. Boston: Oliver Ditson & Co.
Moriarty, J. J. All for Love; or, From the Manger to the Cross. New York: Catholic Publication Society. $1 25.
Parloa, M. The Appledore Cook-Book. Boston: Andrew F. Graves. $1 25.
Savage, M. J. Beliefs about Man. Boston: George H. Ellis.
Shakespeare's Comedy of Love's Labour's Lost. Edited by W. J. Rolfe. New York: Harper & Brothers.
Spedding, J. Evenings with a Reviewer; or, Macaulay and Bacon. 2 vols. Boston: Houghton, Mifflin & Co. $7.
Spurgeon, C. H. The Treasury of David. Vol. I. Psalms i. to xxvi. New York: I. K. Funk & Co. $2.
Stebbing, Grace. Only a Tramp; or, The Golden Links. New York: T. Whittaker. $1.
Stillman, Dr. J. D. B. The Horse in Motion. Boston: J. R. Osgood & Co. $10.
Strathesk, J. Bits from Blinkbonny; or, Bell of the Manse. New York: Robert Carter & Bros. $1 50.
Stuart, Catherine. The Complete Cook-Book. New York: W. B. Smith & Co. $1 25.

Wallace, J. W. The [Law] Reporter Arranged and Characterized. Fourth edition, revised and enlarged. Boston: Soule & Bugbee.
Wilkes, G. Shakespeare from an American Point of View. 3d ed. New York: D. Appleton & Co. $3 50.
Wright, E. La Fontaine's Fables. New edition, with Notes by J. W. M. Gibbs. London: George Bell & Sons.
Yonge, Charlotte M. History of France. [Series of History Primers.] New York: D. Appleton & Co. 45 cts.

HENRY HOLT & Co.

HAVE READY:

Auerbach's Spinoza.

16mo (Leisure-Hour Series), $1.

ALEXANDER BAIN'S

JOHN STUART MILL. 12mo, $1.

JAMES MILL. 12mo, $2.

HENRY W. LONGFELLOW

Wrote: "I shall often read and enjoy this

Cyclopædia of Practical Quotations.

I am glad to see that it is so thoroughly furnished with indexes of authors and subjects. It can hardly fail to be a very successful and favorite volume."

Royal 8vo, 900 pp., 17,000 quotations, 50,000 lines of concordance, enabling any one at once to find any quotation desired. Price $5. For sale at BRENTANO'S, 5 Union Square; PUTNAM'S SONS, 27 West Twenty-third Street, and at other book-stores; also, by the publishers,

I. K. FUNK & CO.,
Nos. 10 and 12 Dey Street, New York.

PELLUCIDITE,

A superior substitute for Varnish, for either inside or outside work. Just the thing for front-doors, sash, floors, hard-wood finish, etc., or anywhere that a durable and handsome finish is wanted. Send for circular to

SEELEY BROS., 32 Burling Slip, N. Y.

OXFORD, ENGLAND.

THE MITRE HOTEL.

This well-known hotel, established in the year 1400, is largely patronized by families and gentlemen visiting the University from all parts of the world.
Its superior accommodation and reasonable charges highly recommend it. Ladies' coffee-room. Billiards.

OLD POINT COMFORT, VIRGINIA.

THE HYGEIA HOTEL,

Situated 100 yards from Fort Monroe, open all the year. Equal to any hotel in the United States as a Winter Home or Seashore Resort. Send for pamphlet describing hygienic advantages, etc.

H. PHOEBUS, Proprietor.

LADIES' SUMMER TRIP

TO EUROPE.

TOUR OF EIGHTY-THREE DAYS.

For itinerary, price, and full particulars, address Miss A. C. MORGAN, Principal Young Ladies' School, Box 285, Portsmouth, N. H.

GAS FIXTURES.

Art Bronzes & Pancoast M'f'g Co.

67 Greene ... 68 to 74 Wooster Streets, New York, make a specialty of furnishing dwellings and churches with GAS FIXTURES adapted in style and finish to the architecture and interior decoration.

SEEDS! SEEDS! SEEDS!

My Annual Priced Catalogue is now ready, and will be mailed free to all applicants. It contains all the leading and most popular sorts of

Vegetable, Field, & Flower Seeds,

besides all the desirable novelties of last season, and nearly everything else in my line of business.

ALFRED BRIDGEMAN,
876 Broadway, New York.

UNMOUNTED PHOTOGRAPHS

Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architecture, etc. Price, cabinet size, $1 50 per doz. Send 6-cent stamp for catalogues of 3,700 subjects. JOHN P. SOULE, Publisher, 338 Washington St., Boston, Mass.

WE SHALL PUBLISH APRIL 10, 1882:

A Series of

TEN GEOLOGICAL PLATES,

27½ x 36 inches, containing Fifteen Diagrams designed for use in Schools and Colleges. Edited by A. S. Packard, Jr., Professor of Geology and Zoölogy, Brown University, and Editor of 'The American Naturalist,' author of 'Zoölogy,' etc.

The diagrams are to be accompanied by a Text-Book, FIRST LESSONS IN GEOLOGY, 128 pages, 8vo, by Prof. Packard.
The series of diagrams are arranged in the form of landscapes, and contain a number of original restorations of American, Silurian, and Devonian animals, especially Carboniferous, Jurassic, and Tertiary Vertebrate animals, by Prof. E. D. Cope, H. F. Osborn, and the Editor; with restorations in the text.
Price for the ten diagrams and book, postage paid, $6. Address all orders to THE PROVIDENCE LITHOGRAPH CO., Providence, R. I.

Engravings and Etchings.

Old and Modern. Fine framing. FREDERICK KEPPEL, 23 East Sixteenth Street (Union Square). Correspondence invited. Visitors always welcome.

1841. CHEAPER THAN BEEF. 1841.

A Superior Ham or piece of Breakfast Bacon.

41ST YEAR OF THE

Celebrated Diamond Hams.

"S. DAVIS, JR.," Cincinnati.

The Nation.

NEW YORK, THURSDAY, APRIL 6, 1882.

The Week.

THE President has vetoed the Anti-Chinese Bill for the somewhat obvious reasons which have been already set forth in these columns as fatal objections to it. The first is that it violates the treaty—if not in the letter, in the spirit. Twenty years' suspension of immigration, he holds, as every candid man must hold, amounts to prohibition; and he shows by copious citations from the protocol of the negotiations which preceded the treaty, that the Chinese Commissioners took a firm stand against prohibition, and understood, and were allowed to understand, that "suspension" or "limitation" meant simply prohibition for not more than five years, or for alternate years, so as to keep the number of Chinese in this country within the limits which the United States might think desirable in the interest of peace and good order. Twenty years' suspension would exclude a generation, and is, therefore, not "reasonable." The President's remarks on the proposed introduction of the odious passport system into the United States, at the moment when "it is fast disappearing in Europe before the progress of liberal institutions," in which he stigmatizes it as "undemocratic and hostile to the spirit of our institutions," will be read with deep satisfaction by everybody who thinks that the spirit of our institutions is the spirit of freedom. The passage of a bill containing such a provision ought to put a mark on every man who voted for it by which voters would recognize him, and give him his deserts, every time he offered himself for election.

No part of the President's argument is, however, more weighty than that in which he points out the enormous folly of which the Pacific Slope will be guilty if it quarrels with China or alienates the Chinese. The opening of the East to Western trade is the greatest fact in the more recent commercial history. There is a fair prospect that within a very few years the traffic both of Europe and America with Asia will reach dimensions as yet undreamed of; and China, both owing to its natural resources and the character of its population, is likely to be the best market in Asia; and, what is perhaps more to our purpose, the Chinese are likely to do the largest part of the business of exchange between the East and West. They have already, to a very large extent, taken the Chinese trade out of the hands of the English, who have so long held it, and they will undoubtedly largely control its current hereafter. No country is so favorably situated for a large share in this trade as our Pacific States; none has thus far profited more by it. To divert it to other channels now by treating the Chinese with hostility, and displaying against them the old barbarous spirit of seclusion which they are gradually throwing off, would be a mistake of such magnitude that we can hardly believe the people of that region will, on sober second thought, be guilty of it.

The new Cabinet appointments still hang fire. Hitherto, President Arthur has made no changes in the Cabinet except upon the ground of resignations insisted upon by the retiring members. The changes in the Navy and Interior Departments now in contemplation are more in the nature of removals, and, as removals without "cause" except political are liable to be criticised, rumor speaks of cause for these. It is said that Secretary Hunt's health is becoming too precarious for the duties which the Navy Department imposes upon him. And as to Mr. Kirkwood, it is reported that "Congressmen and others" are constantly running to the President with the complaint that the present Secretary of the Interior is too old and slow, and that they "cannot get things done." We can only express the hope that President Arthur may be spared experience of a Secretary of the Interior of whom no complaint is made by "Congressmen and others" that they "cannot get things done"; for that would be a sure sign that things are done which ought not to be done, and that there is mischief in the department.

Mr. Hewitt's speech on the tariff unites the acquired knowledge of the business man with the logical faculty of the student, and cannot fail, therefore, to make an impression upon the public mind. After showing that a protective tariff has not the virtue sometimes claimed for it of shielding the country against commercial crises and hard times, Mr. Hewitt proves that what the country now needs is access to the markets of the world for manufactured products in order to tide over hard times when they come, and to guard against the deleterious effects upon our international trade of a partial failure of the crops at home, or a superabundance of the same products abroad. In other words, we want more than one string to our bow. We rely now almost wholly upon our own surplus food and other raw products to pay for our imports. In any case, when our supply of such products is limited by accidental causes, or the demand falls off, we have no resource. Our manufactures cannot fill the gap, because they are not offered at prices which the world is willing to pay. They cannot be produced here and sold in competition with English and German products of similar make, because of the taxes imposed on the raw materials and implements of manufacturing industry, in the shape of duties on ores, coal, wool, copper, scrap iron, chemicals, dye stuffs, machinery, etc., which enhance the cost of these indispensable articles that lie at the foundation of manufactures. Mr. Hewitt says strike these off, and when you have done so you can strike off a corresponding proportion of the duties now imposed on the manufactured articles, without doing any harm or injustice to them. This is plain to everybody.

Mr. Hewitt next shows that for this initial step a Tariff Commission is not necessary. Raw materials are as well known to Congressmen as to experts. They are as well known to-day as they can be next year—as well known to the Forty-seventh Congress as they can be to the Forty-eighth. Why not lop them off now, and then proceed in a business-like way to reduce the duties on the manufactured articles of which they are component parts? "From the examinations which I have made," says Mr. Hewitt, "the results of which only it is here possible to give, I am satisfied that in the cotton manufactures duties varying between twenty-five and thirty per cent. will be sufficient; in the woollen business from thirty to thirty-five per cent., in the iron and steel business from thirty-five to fifty per cent., in the pottery business about the same rates, and in the silk business about forty per cent., would cover the difference in labor, provided the duties are entirely removed from the raw materials used in these several branches of manufacture. Now, if it be conceded or can be demonstrated that these rates are sufficient in order to compensate for the difference in the wages of labor, we have simply to apply them in order to meet the demands of those who insist and concede that the tariff must afford adequate protection to American labor." He proceeds to argue that our present manufacturing capacity is, in many important branches, not only equal to the home demand, but in excess of it, leaving a surplus which must be sold at a loss if it cannot find foreign markets. But such a surplus cannot be long produced. Works now running in this condition must soon curtail their production and throw a portion of their operatives out of employment. Are there not signs of such disturbance now in the New England States, and is not this trouble likely to increase unless met by some policy which shall give us access to the markets of the world?

The indictment against General Curtis for collecting political assessments from Custom-house employees was quashed on Thursday in the United States Circuit Court, on the ground that the defendant's name is Newton M. and not Nehemiah M. Curtis. This is of course what every one in the least familiar with the procedure in criminal cases must have anticipated; curious as the mistake was, the result, when it had once been made, was unavoidable. It is now reported, however, that the District Attorney does not propose to trouble himself about the case further, unless a new complaint is made; a story which is hardly credible, for the simple reason that the failure of the prosecution was solely due to the negligence of the District Attorney or of subordinates for whom he is responsible. It was the District Attorney's business to find out the defendant's name, and while the public are undoubtedly willing to accept the explanation put forward, of the name "Nehemiah" having crept into the indictment through inadvertence, what they need to con-

vince them of it is that he should be immediately indicted over again; and any inaction on the District Attorney's part now must be regarded as tantamount to a confession that there is no real intention to make an example of General Curtis's flagrant violation of the law.

The statute under which the indictment was found was passed seven years ago, for the express purpose of breaking up the system of extortion, practised on clerks and employees, known as "political assessments." The language of the act, which is as much a part of the law of the land as the sections of the Revised Statutes which relate to bribery or petit larceny, is as follows: "That all executive officers or employees of the United States, not appointed by the President with the advice and consent of the Senate, are prohibited from *requesting*, giving to, or *receiving* from, any other officer or employee of the Government, any money or property, or other thing of value, for political purposes; and any such officer or employee who shall offend against the provisions of this section, shall be . . . deemed guilty of a misdemeanor, and on conviction thereof shall be fined in a sum not exceeding five hundred dollars." For seven years no effort has been made to enforce this law, and therefore the announcement that the present Administration intended to enforce it in Curtis's case was received with a good deal of genuine surprise as well as pleasure. It was a sign of the willingness of the Administration to carry out the law as it stood. It is safe to say that with an Administration really determined to put its machinery to use for this purpose, no more political assessments would be collected in the Custom-house, at least by the class of tax-gatherers to which General Curtis belongs. After inaction for so long a period, to take up his case in order to make it a warning to others in similar positions, and then to let the whole proceeding go by the board because the Government's prosecuting officer made a mistake of a very unnecessary kind in drawing up the indictment, would not only place the District Attorney in a very false position, but would make it look as if the Administration, which set the prosecution in motion, desired General Curtis to escape, or, in other words, desired to make the whole proceeding wear the look of a farce, and to discredit, instead of advancing, the reform about which it has made so many promises.

The House Foreign Affairs Committee has received a letter from Minister Hurlbut, calling attention to one or two facts with regard to the Cochet claim, which he innocently says he "understands" to be the foundation of the "Peruvian Company." First, Alexander Cochet was a French citizen; second, the son, the claimant, was illegitimate; third, his rights, therefore, if any, descend to his French sisters; fourth, it follows that if there is any claim at all, it is a French claim, and the United States have nothing to do with it; fifth, the Cochet claim is a claim for discovering guano, while the law under which it is made relates to the discovery of treasure belonging to suppressed convents; sixth, Cochet himself never made any claim; seventh, the claim was decided against Cochet in 1861 by a mixed commission, specially appointed for the purpose, and is therefore *res adjudicata*. This would seem to make the presentation of it by the United States very much like the suit for damages to the brass cannon borrowed for the Fourth of July—the facts in the case being that it never had been lent; that it was burst when borrowed; that it had been long since returned, and that it was returned uninjured. General Hurlbut's vigorous analysis of the merits of the Cochet claim is altogether his best state paper.

Mr. Price, Commissioner of Indian Affairs, is reported to have said that it is nonsense for Indian delegations to come to Washington, for the reason that "they don't know what they want when they start, and the longer they stay the less they know." We are inclined to think that Mr. Price has been misquoted. Indian delegations usually know very well what they want, although they do not always know what they get. But when such Indian delegations are well selected, and their movements are judiciously managed, their visits can be turned to good account in another respect. The observations they make while they are among us, and the impressions of civilized life, however crude, which they take home with them, have not only served to discourage the spirit of fight and mischief among them, but also stimulated their desire to have their children educated. In this respect the visits of Indian delegations to the schools at Hampton and Carlisle have proved especially useful.

Senator Hoar moved by way of amendment to the Indian Appropriation Bill that $2,000,000 be appropriated for the purpose of enabling the Secretary "to provide for the care, support, and education, in any of the States, of Indian children dwelling west of the Mississippi, and not belonging to the five Indian tribes in the Indian Territory, or so many thereof as may be practicable, under regulations approved by the President, at a cost not exceeding $200 a year for each child." This may at first sight appear like an extravagant proposition, but it is not. It would be the most economical as well as the most humane thing that could be done. The success of the schools at Hampton, Carlisle, and Forest Grove in instructing Indian children, not only in the rudiments of knowledge, but also in practical work, clearly indicates that the enlargement of that educational system will be the surest way to make the Indians self-supporting; and we may rely upon it that no Indian tribe will take the war path while its children are in a Government school. A few millions spent in that direction now will save a great many millions in the future. The Senate has adopted at least the principle of Mr. Hoar's amendment, although it has very much reduced the amount of money he asked for, voting to appropriate only $250,000. This sum is not as large as it ought to be, but it will suffice for the organization of three or four more Indian schools like those at Carlisle and Forest Grove, and for the support of about 1,200 Indian pupils there for one year.

During the early part of the week foreign exchange ruled below the gold-exporting point, but late in the week rates were advanced so that Tuesday's steamer took out $750,000 gold coin. The foreign-trade returns of the Custom-house show diminishing exports of merchandise and increasing imports. The difference has to be made up by the export either of securities or of gold, and while the former paid most of this difference for the week, it was necessary to send the gold named. The money market passed the first of April without any stringency. The New York banks, in satisfying the demand from New England and the Middle States for money to facilitate April settlements, lost about half of their surplus reserve, but the remainder was more than they held at the corresponding time a year ago. The Treasury disbursements during April for interest and bonds redeemed amount to $27,500,000, which, together with the natural turn of all the domestic exchanges in favor of New York, ought to make and keep the money market easy for the next few months, even if the gold exports are considerable. At the Stock Exchange United States 4 and 4½ per per cent. bonds advanced to the highest prices ever paid for them—the former to 119⅝@¾, and the latter to 115¼@½. The week was full of surprises in the stock market, which for several weeks has been advancing and gave every promise of being buoyant after the opening of April. Instead of this there was a sudden break in the leading stocks which have been openly supported during the recent rise by W. H. Vanderbilt and Jay Gould. This break unsettled the whole stock market, the Gould stocks being features in the decline; and the week closed with a good deal of doubt as to the course in the early future of prices of the leading stocks.

Mr. Hayes, a stenographer in the House of Representatives, has been removed and Mr. Dawson has been appointed in his place. Hayes is a Democrat and Dawson is a Republican. If Speaker Keifer was induced to make the change by an ascertained inferiority of the Democratic short-hand method to the Republican, he does not make known the fact. Indeed, he does not show great eagerness to make known any facts whatever in the case. He says that the reporter was removed "for cause," but does not say what the cause was. It is said that Dawson was a good soldier, but it is not at the same time asserted that Hayes was a bad one, or that he omitted to bear arms at all. We are further told that the House stenographers are nearly all Democrats, and that Republican reporters ought to have a chance. This consideration would have more weight as a sign of an era of good feeling and a non-partisan civil service if, in some department where the clerks are all Republicans, half of them should be requested to withdraw in order to give the Democrats a chance. The one conspicuous thing upon which stress is laid is Hayes's membership of the Democratic party. That there is nothing else against him

may be assumed because he has served for fourteen years, although during the greater part of the time the House was Republican. The rules empower the Speaker to remove a stenographer "for cause." Mr. Stephens of Georgia has moved an investigation as to whether the rules were complied with in this case. The Judiciary Committee, to whom the motion was referred, should report it favorably, and if upon inquiry it appears that Hayes is a competent and faithful reporter, the Speaker should be instructed to restore him to his place. "Cause" can mean only a cause relating to the performance of official duty.

The question how to get a receivership of a life-insurance company started is being gradually unfolded by the legislative investigation; the mode of proceeding, after it is once started, so as to convey the assets to the pockets of receivers, lawyers, and hangers-on of Tammany Hall being already well advertised and understood. If a life-insurance company has really become insolvent, this fact will be known to its own officers first. They will then get somebody to act as plaintiff to bring suit against it. The plaintiff will allege insolvency, and the company will confess. The plaintiff will then move for the appointment of a receiver, and plaintiff and defendant together will agree upon Mr. A as a suitable person. The judge before whom the case is brought is not bound to appoint Mr. A merely because the parties have agreed upon him. He is bound to appoint somebody known to himself to be a fit person, since the receiver is really an officer of the court appointed to take charge of certain details, and to advise the court from time to time what ought to be done. But if the judge wishes to play into the hands of the so-called plaintiff and defendant, who are really acting together for a common purpose, he can appoint Mr. A and defend himself upon the ground that both parties to the suit were satisfied. After a time the process of distributing the assets may seem to the policy-holders too sluggish as judged by the amount which reaches them, and they may unite to demand the removal of the receiver. This is, perhaps, the very thing that the parties controlling the proceedings desire, as a change will make room for another fellow and his friends, who have not as yet had anything, but who ought to be taken care of. The receivership may now be considered fairly started, and it will be likely to run along until an investigation by the Legislature takes place, or until the Attorney-General moves to wind it up. In the latter case the judge may interfere, if there are any assets left, and send the case to a referee for further examination.

On Thursday Mr. Gladstone achieved a signal victory in the House of Commons. The resolution introduced by the Government so changing the rules of the House as to permit the closing of a debate by a majority vote, the so-called *clôture*, had not only met with bitter opposition on the part of the Conservatives and the Parnellites, but caused division in the Liberal ranks. Even many of those who continued to follow Mr. Gladstone's lead in this matter were said to do so with great reluctance. The London *Times* and other newspapers lost no opportunity of encouraging defection among the Liberals. The first test vote was expected to show how large that defection was, and thereby to decide not only the fate of the measure, but the fate of the Gladstone Administration itself. This test vote has now been taken. It was on Mr. Marriott's amendment providing "that no resolution shall be satisfactory which enables a bare majority to close the debate." This amendment, which involved the fundamental principle of the Government measure, was rejected by a vote of 318 to 279. Both sides had made every possible effort to have their whole strength on the field. A majority of thirty-nine in a full House is not an overwhelming one. But considering that it was larger than had been anticipated; that it was taken upon the point most obnoxious to the dissenters in the Liberal party, and that therefore the Government may reasonably expect to be stronger on every other point of its policy than on this, the result may be looked upon as a decided triumph.

Mr. Gladstone has made a speech in the House of Commons in which he confesses the extreme difficulty of the situation in Ireland in view of the recent increase of appalling murders and outrages, and even Liberal papers like the *Daily News*, from which the policy of coercion has hitherto received only lukewarm support, are asking for still sterner measures. Mr. Gladstone says truly that no such state of things as now exists has been witnessed in Ireland within fifty years, and that the country is passing through a social rather than a political revolution. This is true, but in the fact that he cannot go further back than fifty years lies the difficulty of the crisis. Fifty years ago the Irish were behaving just as they are behaving now, and for precisely the same purpose—the production of certain changes in their social and political condition; and the worst of it was that in agitating through murder and arson they were agitating in the only way they had ever found successful. During these fifty years nothing or next to nothing has been done for radical reform in the land tenure, which all sagacious observers, home and foreign, official and non-official, have pronounced necessary. A remedy has now come in the Land Bill, but it is found to be only partial, for it does nothing for those who have fallen into arrears of rent through the two bad years which led to the enactment of the Land Bill, and does not prevent evictions for those arrears, and the evictions are being met, as they have always been met for two hundred years, by murder. In fact, murder has been allowed to do so much for the Irish peasant, as a social and political remedy, that it has apparently obtained a sort of horrible recognition from his conscience as a legitimate means of getting anything he wants, not from landlords only, but from anybody. The story of the Pennsylvania Molly Maguires is one which may well appall any statesman called upon to deal with the Irish problem, for it shows that readiness to assassinate has become a disease of the Irish mind, and that probably no specific piece of legislation will cure it. It will take long years of new social and political influences and surroundings to cure it.

The reason why the Irish Coercion Bill just now does not work well with the Land Bill—that is, the reason the Land Bill does not make the Coercion Bill unnecessary—is only in part the continuance of evictions. It is also in part the profound belief of the peasantry that, but for the exertions of the men whom Mr. Forster has now under lock and key, the Land Bill would never have been passed. Whether this belief be well or ill founded, there is a great deal of warrant for it in Irish experience, and it would be against all the rules of Irish politics if the friends of the suspects failed to show their gratitude to them by every way in their reach, including, of course, intimidation. It now begins to dawn on the English mind that Mr. Forster is not the man for the situation, and that his brave speech from a hotel window in the west of Ireland the other day had by no means the sedative influence which the Liberal papers expected from it. He was treated with courtesy, but that clearly meant little, for his language was that of a master and a foreigner, and has apparently added fuel to the flames. The most probable results of the great increase of the complication will be the strengthening of the Tory movement in favor of Government aid to the establishment of peasant proprietorship on a large scale. This would of course indirectly include compensation to the landlords, as it would involve the purchase of their estates.

The assassination of General Strelnikoff at Odessa has made it evident that the Nihilists in Russia have not abandoned the "execution" of Government officers odious to them as part of their programme; and the prompt measures taken by the Government to have the assassins tried and hung, indicates that the mild and conciliatory policy with which the Russian Government was recently credited has had to yield to the strain of circumstances. The era of good feeling seems to be as far off as ever, and the state of nervous irritation into which the doings of the Nihilists have thrown the Russian Government may therefore be looked upon as no less strong a factor in the policy of that government than before. Apropos of this, a piece of news published by the Berlin *Germania*, the organ of the German Ultramontanes, is of special interest. It is that an agreement has been effected between the Russian Government and the Pope, securing to the Catholics in Russia freedom of worship. This spring the exiled Bishops are to be permitted to return to Russia, and their pastoral letters will no longer be subjected to a censorship. It is said that the Russian Government, in view of its diplomatic isolation in Europe, wants to be at least on the friendliest possible terms with the peoples subject to its rule, and that this agreement with the Pope is mainly intended to conciliate the Poles, whose good or bad humor would, as we point out on another page, be a matter of great importance to Russia in case of an international conflict.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

THE President sent a message to the Senate vetoing the Chinese Immigration Bill on Tuesday. He thinks the bill a violation of the Burlingame Treaty, and, therefore, a breach of national faith. He also thinks it contrary to good policy, and suggests that while the protection of American labor from Asiatic competition may justify a restrictive policy, it is wiser to make a shorter experiment, with a view to retaining only such features as experience may show to be prudent.

The President has approved the Act granting pensions to Mrs. Garfield, Mrs. Polk, and Mrs. Tyler.

The President sent to Congress on Thursday a letter addressed to him by the Secretary of the Interior, enclosing a communication from the Commissioner of Indian Affairs, urging action on the part of Congress for the more adequate prevention of trespasses on Indian lands, and presenting the draft of a bill to attain this object.

The bill to admit the Territory of Dakota to the Union was reported back to the Senate Committee on Territories, owing to a protest against the admission sent to Congress by the bondholders of the Dakota Southern Railroad, based on the repudiation by the county of Yankton in that Territory of bonds issued by the county to aid in the construction of the railroad. The committee considered the matter on Friday, and came to the conclusion that the bondholders' grievance is one for the courts and not Congress to deal with, and reported the bill back to the Senate again by a strict party vote, the four Republican members of the committee voting in favor of the bill against the three Democratic members.

A bill has been introduced into the Senate to prohibit the importation of neat cattle from Canada. It provides that importation shall be prohibited until the President shall declare that the discrimination in this matter against the United States on the part of Canada has ceased.

The debate on the Tariff Commission Bill was continued in the House on Wednesday and Thursday, and on Friday the Army Appropriation Bill was considered in Committee of the Whole. On Monday the Ute and Crow Land Bills were passed under a suspension of the rules, and a motion to fix a day for discussing the Bank Charter Extension Bill was defeated, and a number of bills appropriating money for the erection of public buildings in various States were passed.

The House Committee on Improvement of the Mississippi River have decided that it will be more effective for committeemen to remain in Washington and look after appropriations for the overflowed districts than to proceed to the river for the purpose of examining and reporting as to the cause of the present flood. The waters in the Mississippi Valley are slowly subsiding, although at some points they have risen during the week. Reports of casualties of various kinds resulting from the flood continue to be received. Active relief work continues, Government rations being shipped to all points requiring them.

The House Committee on Commerce adopted a resolution on Thursday, "that it is the sense of this committee that some measure relating to inter-State commerce shall be adopted by this committee and reported to the House at the earliest practicable moment after the River and Harbor Bill shall have been reported to the House." It was then decided to lay aside the various inter-State commerce bills for the purpose of proceeding with the consideration of the bill named.

Meetings have been held and resolutions passed in various parts of the country protesting against the arrest and detention without trial in prison of American citizens in Ireland. The American citizens referred to are Irishmen naturalized in the United States, who by their conduct in Ireland have made themselves amenable to arrest under the Coercion Act. Mr. Lowell, by refusing to interfere in these cases, has brought down upon himself the wrath of many influential bodies of citizens, including the New York Board of Aldermen, who passed resolutions denouncing him and demanding his recall. A mass-meeting was held at the Cooper Union in New York on Monday evening to protest against the course of the English Government in the matter. There were several speakers, and letters were read from a number of prominent men sympathizing with the objects of the meeting. The American Government, meantime, has procured the release of several of the "suspects."

Mr. Frelinghuysen received a despatch from Mr. Lowell, on Saturday, announcing that, in deference to President Arthur's request, a respite of a fortnight had been granted to Dr. Lamson. This, however, is to be construed merely as affording to the friends of the prisoner time to bring forward evidence bearing on the case, and does not imply that the sentence has been commuted.

Secretary Hunt has received two cable messages from Lieutenant Harber from Irkutsk. Difficulties have arisen in regard to the hiring of a steamer to search for the lost members of the *Jeannette* crew. Lieutenant Harber says that if he does not get one, he will start expeditions to search the coast from the mouth of the Yana to the Lena delta, and from the Olenek to the delta, and when the delta is clear of ice he will search it thoroughly in boats. He had received no news from Engineer Melville.

Secretary Hunt has telegraphed to Lieutenant Harber giving him authority to spend $6,600 in getting a vessel to aid in the search for the lost members of the crew of the *Jeannette*.

Notice has been given that the Post-office Department will begin on April 10th the issue of a new postage-stamp of the denomination of five cents, and bearing a portrait of President Garfield.

Mr. Richard T. Merrick has been appointed counsel to assist Colonel Bliss in the prosecution of the Star-route cases, to take the place held by Mr. Brewster before his appointment to the Attorney-Generalship. On Friday the argument to quash the indictments was begun before Judge Wylie at Washington. Mr. R. G. Ingersoll opened for the defence. The basis of the argument is a lack of jurisdiction on the part of the Grand Jury which found the indictment, and certain technical defects and irregularities in the matter. The arguments were concluded on Saturday, and Judge Wylie reserved his decision.

Attorney-General Brewster's recent letter to Mr. Sanders, urging vigorous prosecution of the election frauds in South Carolina, has created considerable excitement in that State. "The effect has been to intensify the partisan feelings of the Democrats, and probably to render the conviction of any of the accused and guilty persons an impossibility. No Democratic juror will now dare to vote for conviction, no matter how clear and conclusive may be the evidence of guilt," says a prominent South Carolina Republican. The Charleston *News and Courier* says that the "people must begin at once, and teach the Stalwart conspirators that the State shall not be put in a position to be Africanized again. Let the accused election officers feel and see that the State is with them. Let every one of the accused understand unmistakably that his cause is the cause of civilization, order, and good government," etc.

The State Democratic Executive Committee of South Carolina has decided that it would be unwise to employ the law officers of the State in their official capacity to defend the election-law violators, but several of them will appear as special counsel, under instructions from the Executive Committee. Senator Butler will also assist in the defence. An address was adopted calling upon the white men of the State to give the prosecuted Democrats their moral support, and to contribute liberally toward the expenses of the trials.

Judge Blatchford took the oath and entered upon the discharge of his duties as Associate Justice of the United States Supreme Court on Monday.

The bill of exceptions in the Guiteau case was signed on Thursday by Judge Cox. The exceptions taken are on the non-admission of certain evidence and the rulings of the Judge on points of law. It is the intention of District Attorney Corkhill to present the bill for a hearing on the first day of the next term, which will be April 24.

Information was received in New York on Monday of the death of S. A. Hurlbut, late United States Minister to Peru, on the 28th of March, of heart-disease.

Ex-Senator Sargent, the newly-appointed Minister to Berlin, was given a dinner on Thursday night, at the Palace Hotel in San Francisco, by a large number of the prominent merchants and professional men of the city.

A meeting for the purpose of organizing a national board of lady managers of the Garfield Memorial Hospital Association was held in Washington, on Wednesday. Senator Windom presided. The chairman of the Ways and Means Committee stated that almost enough money had been raised to justify placing the hospital in active operation. The organization of the Ladies' Aid Society of the Garfield Memorial Hospital was effected, and Mrs. Windom was elected president.

All hands in the Bureau of Engraving and Printing at Washington, employed on internal-revenue stamps, have been furloughed because the appropriation for this purpose has been exhausted. This throws about 500 persons, mostly women, out of employment.

The Readjusters in Virginia were defeated in the State Senate on Thursday in one of their chief partisan measures—namely, the bill reducing the number of the judicial circuits of the State from eighteen to twelve, which would have turned out all the present circuit judges and made necessary the election of new ones.

A convention of colored men was held at Goldsborough, North Carolina, on Thursday, at which all the negro counties of the State were represented by delegates. Resolutions were adopted declaring that they "hailed with pleasure the unmistakable evidence of a liberal movement in North Carolina," and would "join hands with liberal men who may have heretofore acted with the Democratic party, and who are willing to bury the dead past in an earnest effort to build up the State and guarantee to all equal rights and privileges."

A sensation was created on Thursday in New Jersey by the disclosure of an attempt to bribe a member of the New Jersey Legislature to vote for a bill to secure the Jersey City and Hoboken water fronts to certain railroads. An Assemblyman named Shinn made an affidavit to the effect that he had been offered a thousand dollars to vote for the bill. An investigation was ordered, but no new facts of importance have been elicited.

The Mormon President Taylor, of Salt Lake City, and some of the apostles who had their polygamous wives living in one house with them, fearing arrest under a section of the Edmunds Bill which makes cohabitation with more than one woman a misdemeanor, have dispersed their harems. Taylor told his wives that if he could not have all of them, he would not have any of them.

The number of immigrants that arrived in New York during the month of March is larger than in the same month in any previous year. The total number of immigrants who arrived in this city during the past three months is 73,433, as against 47,847 for the first quarter of 1881, and 32,702 in 1880.

A great snow and wind storm visited the Northwest, from Southern Dakota to Manitoba, a week ago last Saturday, and the reports which have been slowly coming in show that many lives were lost and much damage done to property.

The steamboat *Golden City*, running between New Orleans and Cincinnati, was destroyed by fire on Thursday morning, just as preparations were being made to land at Memphis, Tenn. An ineffectual attempt was made to effect a landing and avert the catastrophe. About thirty of the hundred persons on board lost their lives.

Walker Hall, at Amherst College, and its contents were destroyed by fire on Wednesday night. The total loss, including the valuable Shepard collection of minerals, which cannot be replaced, is estimated at $185,000.

The monument erected at Tappan, on the Hudson River, in memory of the English spy, André, by Mr. Cyrus W. Field, which was recently defaced by a man named Hendrix, was again attacked on Thursday night. This time an attempt, which was partially successful, was made to blow it up. The guilty persons have not been found.

FOREIGN.

A vote was taken on Mr. Marriott's amendment to the *clôture*, in the House of Commons, on Thursday night. The proposed amendment, it will be remembered, declares that no rule should be considered satisfactory which would enable a bare majority to close a debate, and the vote was therefore looked upon as a test of the feeling of the House of Commons on the *clôture* question. The House was crowded in every part. Mr. John Bright made a speech, in which he said there could be no doubt that unless something was done to deliver the House from its difficulties it would stand before the country as having neglected its duty, and if the proposed resolution erred, it was in not being sufficiently severe. After speeches by Mr. Gladstone, Sir Stafford Northcote, and others, a division was taken, and the amendment was lost by a vote of 318 to 279.

It is stated that warrants are out against six Irish members of Parliament, and that consequently none of them will visit Ireland during the Parliamentary recess. Mr. Dillon has protested to the physician of the Royal Hospital at Kilmainham against his further detention in the jail, as he feels much worse in health; but Mr. Forster, Chief Secretary for Ireland, declines to release him. Outrages, of which the latest variety consists in stabbing the lambs of rent-paying farmers, continue in Ireland.

There seems to be a general feeling in England that the condition of Ireland is getting more serious every day. A meeting of Liberal members of Parliament was held at the Reform Club on Monday, and it was decided to make strong representations to Mr. Gladstone in regard to the condition of Ireland. Several members expressed the opinion that a new Chief Secretary was required. In replying to Mr. Gorst in the House of Commons, on Tuesday, Mr. Gladstone said that the Government was sensible of the gravity of the condition of Ireland, but it must select its own time for proposing any desirable measures. It was a social, not a political revolution that was in progress. The Land League started when the Conservatives were in power, and there was a strong presumption that the influence of the League was behind the awful crimes which had been committed there. In conclusion, he described the present state of Ireland, and declared that it had no precedent for the past fifty years. Sir Stafford Northcote said that Mr. Gladstone's speech was disappointing, alarming, and unsatisfactory, because it showed vacillation. The House of Commons has adjourned for the Easter holidays.

The opponents of Mr. Bradlaugh are endeavoring to force him into bankruptcy so as to vacate his seat in the House of Commons, and to this end are bringing actions against him on various grounds. In the Court of Queens Bench on Thursday, a judgment for £500 was obtained against him for voting illegally in his seat in Parliament.

A protest has been published in the *Nineteenth Century* against the Channel Tunnel, on the ground that it would involve England in military dangers and liabilities from which as an island she has hitherto been free. The article is signed by a number of the most prominent men in England, including Generals Sir J. Lintorn Simmons and Sir Henry Havelock Allan. In reply to a question in reference to the Channel Tunnel in the House of Commons on Thursday evening, Mr. Joseph Chamberlain, president of the Board of Trade, said that the Government claim the bed of the sea for three miles below low-water mark, and hold themselves free to use any powers at their disposal, as Parliament may direct or the national interest may require.

Mr. Gladstone has stated, in regard to the Monetary Conference, that as the general views of the British Government were made known at the recent meeting of the Conference, it would be premature to enter into them more in detail until the Government is in possession of definite proposals from the foreign governments.

The Government has introduced a "Corrupt Practices" Bill, which will totally disfranchise Gloucester, Macclesfield, and Sandwich, and will suspend the writs for Boston, Canterbury, Chester, and Oxford during the existence of the present Parliament. The bill permanently disfranchises all inhabitants who are scheduled for bribery.

It is probable that the marriage of Prince Leopold will be postponed on account of his ill health. The preparations for the marriage have been suspended.

The Oxford and Cambridge University boat race was rowed on Saturday. Oxford won by twenty lengths, in twenty minutes and twelve seconds. The time of the Cambridge crew was twenty minutes and thirty-seven seconds.

A party of capitalists, farmers, and others sailed from London en route to Winnipeg, Manitoba, on Wednesday. Their total capital is estimated at £125,000. They will be followed every two weeks by other parties.

The British steamer *Yrurac Bat*, bound from Liverpool to Porto Rico, collided with the Royal Mail Company's steamer *Douro*, from Brazil, off Cape Finisterre, on Saturday. Both steamers sank, and thirty-two persons are missing from the *Douro* and nineteen from the *Yrurac Bat*. The *Douro* is said to have had on board £53,000 in specie.

There have been serious riots in Barcelona, and other towns in Spain, growing out of the opposition of the laboring classes to the proposed reform of the tariff. Most of the workshops and mills were closed, and the operatives paraded the streets and did much damage to property. In Barcelona a mob attempted to prevent a train from leaving the depot, and the military fired upon the crowd. A deputation of Catalan operatives were given a hearing before the Chamber of Deputies on Thursday. They represented that the adoption of the Franco-Spanish commercial treaty would deprive 100,000 workmen of their means of subsistence. Two hundred and fifty persons were arrested in Barcelona. The news of the demonstration caused a profound sensation in Madrid, and the province of Catalonia was proclaimed in a state of siege. In the Chamber of Deputies, on Saturday, Señor Sagasta, President of the Council, urged a calm discussion of the Franco-Spanish treaty of commerce, regardless of events in Barcelona. He eulogized the proposals of Señor Comacho, Minister of Finance, relative to the national debt, and said that Spain offered to her creditors all she could, and that she could not remain isolated from European movements. It is announced that the Sagasta cabinet has decided to resign if the financial proposals of Señor Comacho are rejected.

It is stated that Don Carlos has summoned his partisans to a meeting in London, to discuss the abdication of his claims to the throne of Spain in favor of his son.

The Committee on Commercial Treaties in the French Chamber of Deputies advocates a resumption of the negotiations for a treaty with England.

The committee on the bill proposing the abolition of the Concordat has refused to assent to the separation of Church and State. The Chambers have adjourned until May 2. On Saturday the Senate voted the credit of 8,000,000 francs for the Tunis expedition for the second half of the current year, which was agreed to in the Chamber of Deputies on March 28. M. de Freycinet stated that it had been necessary to maintain a force of 35,000 troops in Tunis, which number is being gradually reduced.

The Bey of Tunis has decided to offer to the leading insurgent chiefs, if they will submit, a full pardon, and it is thought they will accept the offer, as their hopes of Turkish aid are greatly diminished.

General Strelnikoff, the Public Prosecutor of the Kieff Military Tribunal, was shot by Nihilists at Odessa on Friday. Two of the assassins were captured, and were hanged at Odessa on Tuesday, April 4. It is officially announced that the Czar has ordered the commutation of all the death sentences passed at the recent Nihilist trials at St. Petersburg to an indefinite period of hard labor in the mines, except in the case of a military officer whose sentence is confirmed, since his position as an officer aggravated his crime.

General Skobeleff has been nominated to a commission for the reorganization of Turkestan. This appointment is said to be looked upon as a kind of honorable exile.

A despatch to the London *Times* says that General Ignatieff professes to have information that a treaty exists between Germany and Sweden, by the terms of which, in the event of a war between Russia and Germany, Sweden will lend her fleet to the latter, receiving Finland if the allies are victorious.

Debate was resumed on the Ecclesiastical bill in the Prussian Diet on Thursday, and, in accordance with a compromise between the Centre and Conservative parties, the provisions relative to the right to protest against ecclesiastical appointments, and concerning the obligation of the clergy to give notice of such appointments, were withdrawn, and, notwithstanding the opposition of the Minister of Ecclesiastical Affairs to several alterations in the bill, it was passed on Friday. The House then adjourned until April 18.

The anniversary of the Sicilian Vespers was celebrated at Palermo, Italy, on Friday. Many shops were closed, and the streets were crowded.

There has been trouble impending between Italy and the Republic of Uruguay, owing to the maltreatment of two Italians in Montevideo. The Italian representative, not being able to obtain satisfaction, left the city, and the Italian Minister at Buenos Ayres was instructed to proceed to Montevideo and inquire into the affair. A telegram was received by the Italian Minister of Foreign Affairs at Rome, on Friday, stating that the two principal offenders had been arrested and would be prosecuted.

It is reported that a conspiracy is on foot in Egypt to restore the ex-Khedive Ismaïl Pasha to the throne, and that Arabi Bey and Abdallah Feyre, the present Ministers of War and Public Instruction, and leaders of the Military Party, have been obliged to take precautions for their personal safety. An attempt was recently made to poison the latter.

Mr. Trescot, in a correspondence which has been published in Chili, has formally withdrawn any offer of the good offices of the United States in the conclusion of peace between Peru and Chili.

TUESDAY, April 4, 1882.

PERFORMANCE AND EVASION.

THE Civil-Service Committee of the Senate have reported to that body Mr. Pendleton's Civil-Service Reform Bill in the shape in which he originally introduced it in December. The bill provides for open competitive examinations for the subordinate places in the executive departments and the larger Government offices in the country, for a term of practical probation before definitive appointment, and for a Civil-Service Commission to supervise the workings of this system. If this bill becomes a law and is executed in good faith, the clerical force of the Government will be delivered from the control of partisanship; it will acquire the necessary degree of stability; appointment and promotion in it will depend exclusively upon merit, and a higher degree of efficiency and character will thus be insured. As far as it goes the bill is very satisfactory to every earnest friend of civil-service reform.

On the other hand, nothing can surpass the ingenuity displayed by the "practical politician" who wants to preserve the spoils and yet at the same time appear to be a friend of reform. How not to do it has been raised by him almost to the dignity of a science, and this science has recently received a very valuable contribution. On March 21st Mr. Dudley, the Commissioner of Pensions, addressed a letter to the Civil-Service Committee of the House of Representatives concerning the appointment of an additional force of clerks, in which he proposes to reform the service in this wise: A board of three persons is to be appointed to examine all applicants "eligible to appointment." The report of the board shall be made to the Secretary of the Interior. The Secretary shall appoint to the vacant places those persons who, in the judgment of the board or of two members thereof, are best fitted for the work of the office. But in making these appointments the Secretary shall (1) have "due regard to a fair and equitable apportionment of the whole force among the several States and Territories," not according to population, but in proportion to the number of Republican votes cast therein. He has (2) to confine himself to persons who have the right to vote somewhere, and are likely to exercise the right regularly, and, "other things being equal, or nearly so," to prefer Republicans. And (3) when it comes to the appointment of examiners of pension claims the Secretary has to consider that men to be fit for that sort of work must be of those who "have settled down to the real work of life; if possible, those who have fought for the nation's life, who are ripe in years and experience, of capacity and education sufficient to enable them to discover the legal points involved," and so on; which things, in the opinion of Mr. Dudley, cannot be found out by examinations. In other words, in such cases, comprising about two-thirds of the whole force, the Secretary will have to be guided very much by what he knows, or rather by what he is told by others, about the applicant's ripeness, experience, capacity, education, and general fitness for official position. Those who are appointed shall at first be commissioned for six months, at the expiration of which period only such shall be recommissioned as are recommended for reappointment by the Commissioner, and then only for a term of three years, subject in the meantime to removal for cause upon the Commissioner's recommendation.

This is the scheme of the "practical politician," and, if accepted, the outcome of it will be exactly what the practical politician desires. Here is an examination provided for. What is the examination to determine? That the man who receives the best rating shall be appointed? Not at all. In order to be "eligible to appointment," the applicant must first be a Republican, and then he must "hail from" a State or Territory which, by the Republican vote cast therein, is "entitled" to an appointment. And then he must have the right to vote somewhere, and be in the habit of exercising that right regularly and steadily. But even if he meets these requirements of eligibility, his winning the first place in an examination will not entitle him to an appointment to a place in the examiners' force, comprising two-thirds of the whole, for the appointing power will, according to Mr. Dudley, have to apply standards which cannot be furnished by an examination. It is evidently upon outside testimony—that is, upon the recommendation of political patrons—that these appointments are to be made. It is reported that there are already over 2,000 names of applicants for these clerkships on file in the Interior Department, and it may be taken for granted that almost every one of the applicants has Congressmen and other politicians at his back to vouch for his "ripe age and experience," his "capacity and education," and all those things which, according to Mr. Dudley, no examination can find out. In other words, the examination is virtually nothing but a mere sham, a make-believe, adopted to invest this method of distributing patronage with the appearance of reform.

Another point. What the service needs, to educate a class of experienced and thoroughly efficient officers and employees, is a certain degree of stability. "Clean sweeps" and "new deals" with every change of Administration are therefore deprecated by every sensible man. But Mr. Dudley's system not only leaves the possibility of sudden and violent changes in the personnel of the service, it invites them, it renders them inevitable. "This is a Republican Administration," says he. Let the Democrats do likewise "when the pendulum swings the other way and the Administration passes into Democratic hands." But even in the meantime the service is not exempt from commotion, for the clerks are to be appointed only for terms of three years, at the end of which it may be necessary to consider new claims of Republican States and Territories as well as of persons. Altogether, Mr. Dudley's so-called reform plan is one of the most mischievous schemes we have yet seen, and it is to be hoped that some sincere friend of civil-service reform in Congress will unmask it there, if it should ever come up for serious consideration.

THE "FAIR-TRADE" AGITATION IN ENGLAND.

THE improvement in the English revenue receipts, and especially in the income tax, which has risen nearly $2,500,000 over the Ministerial estimates, is the best proof that could be given, if not of the restoration of prosperity, of very great improvement in trade. The tax-collector's returns were, however, hardly needed to establish this fact. That improvement had set in was made manifest months ago by the decline and, one may now say, the disappearance of the "fair-trade" agitation. Only a year ago this agitation was giving great comfort to the friends of high tariff in this country. It furnished the texts of hundreds of editorials in the protectionist press. It was pointed to as almost a demonstration of the failure of free trade. No figures were sufficient to make head against it. We might point as much as we pleased to the growth of British industry and commerce under the free-trade régime—the great fact remained, we were told, that a large and growing body of the British people confessed that though free trade might be a good thing if all the world adopted it, no one nation could work it successfully. How were we to get over this? Well, we have got over it simply by waiting a little. It now appears that it was not true that any considerable portion of the British public had come to the conclusion that free trade was a failure. Nor was it true, it now appears also, that the portion of the British public which did clamor for fair trade knew much about trade of any kind, free or fair. They were mostly either persons who were not engaged in or dependent on foreign trade at all, but were much troubled by the fall in the value of agricultural produce, or persons who had never mastered the free-trade theory.

Accordingly, when they were asked for a plan of putting their own theory into execution, the agitation collapsed almost in a month. As long as they had nothing to do but denounce free trade, all went well. The times were bad, and the demand for British goods in certain markets had fallen off, and it was easy enough to say that the reason was that England let people into her markets who would not let her into theirs. But as soon as they were asked what was to be done—supposing all this to be true—the bubble was pricked. The United States were the chief offender against British industry, and, of course, any system of retaliation that might be adopted would have to have the United States for its principal object. The minute the details of retaliation began to be arranged, however, the absurdity of retaliation became clear. Nearly everything the United States sent to England was raw material; that is, it was either food for the artisan, or something out of which he was to make the British exports. In neither case was it possible to put a duty on it without still further increasing the disadvantages under which British produce labored in foreign markets. On most manufactured articles in popular use there was no need of a duty, on any theory, because there was no foreign competition in them. Consequently the movement rapidly died out. The few Tory politicians who had committed or half committed themselves to it, ceased to talk about it. Now the second stage has been reached, and many who favored it, or even took part in it, have begun to

deny that they ever had anything to do with it. It will soon have gone the way of the Know-Nothing craze in this country, and the craze about the Southern Confederacy, and the Jingo craze in England. Probably we shall not again in our time hear anybody in England questioning the wisdom of the free-trade policy because it does not furnish the country with constant protection against commercial depression—as if protection did so, as if anything did so.

It begins, in fact, to be more and more clearly recognized in England by the best observers of industrial phenomena, that English industry runs no serious risk from the high tariffs of the great manufacturing nations, because every high tariff practically deprives the nation which maintains it of access for manufactured products to all markets except its own. If, therefore, Continental Europe and the United States should all devote themselves to the vigorous pursuit of a protectionist policy, it would result, as, in fact, it has resulted already, in giving the ocean carrying-trade and the markets of all the rest of the world to Great Britain. She can, indeed, well afford to surrender the Continent of Europe and the United States, if she is let alone in South America, in Africa, and in the greater part of Asia, with their vast and growing populations, which are gradually beginning to acquire the tastes and feel the wants of civilization. And let alone she will be, as long as Germany, France, and the United States are satisfied with keeping the home market for the domestic manufacturer. In fact, English financiers now begin to foresee that in the future the greatest danger to which "British free trade" will be exposed will be a cheapening of production in this country. If we should ever add to our prodigious abundance of food the advantage which would come from cheap raw materials and cheap everything that we did not ourselves care to manufacture, we should rapidly threaten English supremacy in nearly all the remote markets in which she now consoles herself for the barriers by which those nearer home are surrounded. Consequently the English watch our tariff discussions with far more interest than our diplomatic intriguing in South America. They have what our statesmen have not yet acquired—profound faith in the attractiveness of cheap goods; and, as long as they can offer them, care little what our Hurlbuts and Kilpatricks do to get their trade away from them by treaties or memorandums.

POLAND.

When, eighteen years ago, the last Polish rising against Russia was stamped out, the cause of Poland seemed to be more irretrievably lost than ever. The youth of the kingdom established by the treaties of Vienna had bled away in a protracted struggle marked by despair and fury rather than by warlike heroism. There had been no battle of Grochów, no Ostrolenka, as in 1831; no Dembinski or Bem had arisen. Lithuania lay desolate, a prey to the relentless vindictiveness of Muravyeff, who gloried in the surname of Hangman, bestowed upon him as a distinction by Russian patriotic frenzy. Alexander II., whose kindness and liberalism, yet unchilled and unchecked by attempts on his life, had unfettered Polish sentiment and prompted a revival which led to insurrection for independence, was carried by his weakness and the clamor of Russian fanaticism to the extreme of tyranny in dealing with a people whose special aspirations had so rudely crossed those of his Empire, and had threatened to bring upon it the intervention of Austria, France, and England. The complete Russification of all his Polish provinces was now adopted as the guiding maxim of policy, and this was applied as remorselessly by the better class of his statesmen, such as Tcherkasski and Nicholas Milyutin in Warsaw, as it was by vulgar satraps like Potapoff in Wilna, who made the speaking of Polish in streets, hotels, coffee-houses, or stores, a crime punishable by heavy fines. The main part of the work was done by deportation, military conscription, confiscation, and similar measures. The Aksakoffs and Katkoffs of Moscow applauded, and goaded on the tools of Imperial vengeance. Western Europe, whose impotent protest had been scornfully defied by Gortchakoff, looked on in silent indignation; Prussia seemed to be glad of a dénouement which secured her a more quiet possession of Posen; Austria's absorbing care was to maintain her position as a great German power.

To maintain that position, Austria joined her rival, Prussia, in the war against Denmark, and two years later, in 1866, fought against Prussia on the fatal field of Sadowa. Crushed by one terrible blow, she renounced her leadership in Germany, sacrificed her last possession in Italy, and fell back for support upon those elements in her complex body which she had been wont to consider as the most dangerous—the Magyar and Polish. Hungary was restored in the fulness of her rights, and the national reorganization of Galicia completed. So there was no "finis Poloniæ" yet. But was it not to come soon enough? Was not the colossal Russian power—rejuvenated by the emancipation of the serfs, victorious over her revolted Poles, and intoxicated with national pride—preparing to draw the sword for the unification of all the Slavs under her rule or leadership? Were not her Fadeyeffs and Tchernayeffs preaching a crusade of which Austria was to be the main, if not the first, object and victim? Was not Galicia, entirely open and unprotected on the Russian side, a ready prey for Panslavic invasion? Was not the Ruthene population of the eastern half of that country sufficiently prepared by secret agitation and intrigue for a revolt in favor of the invaders? Was Austria-Hungary able to stand the shock, keep Czechs, Croats, and other Slavic subjects in the bonds of loyalty, and repel the foe and his allies? The outlook, to be sure, was distressing enough for the Austro-Hungarian monarchy, and still more so for the last nationally organized remnant of Poland, Galicia.

But fortunately Russia's *recueillement* after the disastrous Crimean war, checked by the Polish insurrection of 1863, was not yet so complete as to allow of warlike adventures on a grand scale, and Alexander II. was peace-loving, and already intimidated by Karakozoff's and Berezowski's successive regicidal attempts. Before aggression, as urged by Panslavic fanaticism, could be determined upon, Prussia had by her astounding victories over France risen to the height of a mighty empire, the arbiter of the destinies of Europe. Austria-Hungary, guided by Hungarian statesmanship, became Germany's ally, and thus safe from attack. Alexander II., who rejoiced in his uncle's, King William's, triumphs, was yet forced by the violent current of Slavophilism and the feverish restlessness of his people to draw the sword in its sacred cause, but turned it against Turkey. Germany, thankful for his friendly neutrality in 1870–'71, allowed him, in 1877–'8, to carry his armies across the Danube and the Balkan, and to gain small advantages for Russia, at a ruinous cost in men and money; but Gurko, Skobeleff, and Todleben had to return from before the unassaulted walls of Constantinople, and Ignatieff's treaty of San Stefano to be cancelled, at the dictation of Bismarck, backed by Andrássy and Beaconsfield. More than this, while Russia was robbed by the Congress of Berlin of a part of her well-earned honors and influence in the Balkan Peninsula, Austria-Hungary received from the same European Areopagus, as a reward for an equivocal attitude during the great contest, the permission to "occupy and administer" (that is, virtually to annex) two Turkish provinces, Bosnia and Herzegovina—a task which was immediately executed. Russia was furious over this termination, which was charged to the pusillanimity of Alexander II.; and the national rage, equally divided between the Czar and the hated Teutons and Magyars, added venom to the shafts of Nihilism and fresh fuel to Panslavism. The double convulsive disease which has thrown Russia off the track of real progress, has advanced from stage to stage and from menace to menace, finally culminating in the assassination of Alexander II., and the chauvinistic pronunciamientos of the Moscow Slavophils through General Skobeleff. Ignatieff, the chosen instrument of the Moscow Nationalists, rules the Empire, and Alexander III., whom fear of Nihilism has thrown into his arms, is drifting into war, as his father did, at the instigation of the same faction, and under the same guidance.

Scarcely had this tendency of the Russian mind and this bearing of the Russian situation become perfectly clear, when people on both sides of the border began seriously thinking of Poland—or rather of the Polish nation—as a possible factor of the first magnitude in deciding the great international controversy. The Poles began to hope for a new struggle for existence side by side with their old friends the Magyars; the more thoughtful Russians discovered that they had committed an error in cruelly alienating a branch of the Slavic stem still endowed with strength and vigor. The Austro-Hungarian press spoke loudly of the restoration of Poland as a necessity for the safety of the dual monarchy and the freedom of Europe; Bismarck's intentions in the matter became a subject of speculation. The *Golos* of St. Petersburg, on the occasion of the grand Polish celebration at Cracow, in 1879, in honor of the veteran writer Kraszewski, began a bold agitation in favor of reconciliation with the Poles, who had shown that they were still, and were determined to remain, a nation.

The voice of the *Golos* found an echo in other Russian journals; the Polish press of Posen, exasperated by fresh Germanizing efforts of the Prussian Government and its persecution of the leading Polish priests, did not spurn the proffered olive branch, but demanded positive proofs of sincerity, such as the restoration of the Polish language to its rights in the schools of Russian Poland, and the unmuzzling of the press of Warsaw. The latter remained silent; the press of Lemberg and Cracow, inspired by political and religious sympathy for Austria-Hungary, and exultant in its liberty, answered with disdain; Moscow mocked at the visionary dream of liberal St. Petersburg. The Russian Government hesitated with the first tentative indication of a conciliatory design till the beginning of this year—when the Russianized University of Warsaw received the gift of a Polish professorship. The Russian endeavors to win over the Poles to the Slavic side in the "long and terrible" grapple of the Slavs with the Teutons, which Skobeleff and his friends announce as unavoidable and imminent, have, however, been continued to this day, and they are watched with intense interest.

If this terrible struggle between the two races be really unavoidable, the prediction may be hazarded, though not without the necessary reservations, that that race will be victorious on whose side the Poles shall stand. This prediction is not founded on the value of the Polish sword, however high that may be estimated by those who remember 1831, but on the consideration of numbers, geographical position, and politico-religious circumstances. Making rough estimates, and deducting the Poles subject to all the three Emperors, the population of Russia is about equal to those of Austria-Hungary and Germany combined. The military forces of these allies are vastly superior in quality to those of the Czar, but this superiority would, in a long war, be counterbalanced by the advantages which the leader in the Panslavic crusade would derive from the aid of nearly 15,000,000 of non-Polish Slavs of Austria-Hungary (Slovaks, Czechs, Croats, Serbs, Dalmatians, etc.), as well as of 3,000,000 Ruman subjects of that monarchy, men of the Greek faith—if he could only reach and revolutionize them. Count the Poles among the combatants of the allies, and you not only add 12,000,000 to the material they can draw upon, but Galicia remains a shield of Austria-Hungary, the example of the Poles strengthens the fidelity of the Catholic Slavs of that monarchy (Slovaks, Czechs, and Croats), the Slavic phalanx cannot be formed, the struggle assumes the aspect of a fight for and against the Greek cross, and the war is carried on between the Vistula, the Dniepr, and the Düna, where Russia is most vulnerable. Add the 12,000,000 Poles to the military resources of Russia, and you also open to her the road across the Carpathians, the Magyars become immediately crippled by risings of Ruthenes, Serbs, and Rumans—such as ruined the cause of Hungary in 1849—Slovaks and Czechs follow the Polish lead in preferring the claims of race to those of religion, and the monarchy of the Hapsburgs collapses after a terrible agony. All this can, of course, be presumed only on the suppositions that Russia, with her wonted stubbornness and fanaticism, will not break down under the first heavy blows which the conquerors at Sadowa and Sedan might deal her; that, on the other hand, France will be deterred from mingling in the fray by Metz, Strassburg, Coblentz, etc., and the attitude of Italy; and that the forces of the Sultan will keep in check the lately emancipated Christian states of the Balkan Peninsula—but all these suppositions seem to be well grounded.

Both the Russian and German Governments still hesitate to make overtures to the Poles; both continue to treat their respective portions of Poland as hostile territories, to be kept down by the iron hand; and the Poles of each portion hate their own masters most cordially. Religious antagonism sharpens in each the hatred bred by oppression and the remembrance of old feuds; what Russia gains in comparison by race kinship she forfeits by her tyranny. Posen may hesitate in its choice, if choose it must, between the Slavic banner and the Teutonic, seeing no prospect of independence in the victory of either; but Russian Poland, groaning under a galling yoke, will readily join even German invaders, unless convinced that they mean to extend their Prussian border, as such, to or beyond the middle Vistula, or allured by timely Russian assurances of vital concessions; and as long as Russian Poland does not unequivocally declare for the Panslavic cause, which she would do only after a revolution in Russia, or at least in the Russian policy, the Poles of Galicia will stand firmly by Austria-Hungary, defending to the last the cause of their nationality and church against the deadliest foe of both, the Russian power. Galicia considers herself now the nucleus of a future independent Poland, and as such she is kept in provisional allegiance to the Austro-Hungarian monarchy and its Hapsburg dynasty. The dynasty, the Hungarians, and the German-Austrians will have no hesitation in letting that province go free, to become, with other parts of Poland, a rampart against Russia, the weak objective point of whose constantly menaced attack it is now. The opposition of the Czechs and other Slavs of the monarchy to such a diminution of its Slavic strength will easily be overcome. Let Bismarck speak out the word "restoration of Poland," and all the land, from the Carpathians to the Baltic, will be ablaze, and the real Eastern question virtually decided by the Polish nation breaking the Panslavic phalanx, instead of joining it.

That Bismarck, while doing his best to keep Posen firmly attached to Prussia, and dealing roughly—perhaps ostentatiously so—with his Polish opponents in the German Reichstag and Prussian Diet, may yet harbor the thought of one day playing out that word as a great trump, perhaps his greatest, in European politics, has long been suspected. His Boswell, Moritz Busch, has divulged the fact that he once seriously advised the Crown-Prince of Prussia to have his sons taught Polish, as a thing that might be useful in the future. Could Bismarck have thought of an independent Poland under a Prussian secundogeniture? An independent Poland under an Austrian secundogeniture has been the desire of the Polish high nobility since 1831, when negotiations were entered into with Metternich with a view to placing the Archduke Charles upon the throne of Poland. But of late the report has gained currency in wide circles that Bismarck meditates the creation of a Polish throne for the Saxon dynasty in exchange for Saxony, which would be annexed to Prussia. Two Electors of Saxony reigned in Poland, as kings, from 1697 to 1763, and a King of Saxony was Duke of Warsaw from 1807 to 1813. The Saxon dynasty has remained Catholic since Augustus the Strong adopted that faith, in order to gain the Polish crown, in 1697. Protestant Saxony would hardly object to the change of rulers, and this change would be a great step in the unification of Germany directly under the Hohenzollern sceptre. Poland remembers its Saxon monarchs with a kind of charitable complacency. The scheme is very rational—and perhaps not merely *bene trovato*.

OUR PRODUCTION OF THE PRECIOUS METALS.

THE preliminary report on the production of precious metals, by Mr. Clarence King, has just been issued by the Census Bureau. The statistics, which relate to the year ending May 31, 1880, have been to a certain extent forestalled and supplemented by the estimates of the Mint Bureau, and by those of Mr. Valentine, Superintendent of Wells, Fargo & Co.'s express, although these do not relate to the same period as the statistics of the census. In his preliminary notes, Mr. King describes the methods employed for the collection of the statistics, presenting not only those used by himself, but also those used by the Mint Bureau and by Wells, Fargo & Co. The method employed by the Mint is simply that of summarizing the receipts of domestic bullion at the several mints and United States assay offices, adding to this the amount shipped abroad, as shown by custom-house returns, and estimating the amount consumed in the arts. The objections to this method are that the amount coined within a certain period does not necessarily correspond to the production for that period. The estimates of the amount consumed in the arts are necessarily somewhat vague; and, moreover, the record of imports and exports cannot be accurate or complete, inasmuch as no account is taken of bullion transported overland into Canada, and the export figures for base bullion, ores, and matte cannot be depended upon. The method employed by Mr. Valentine consists in estimating the product from the statistics of the express companies and of the freight lines and banks which handle it. This plan would give satisfactory results if *all* the products of the mines were handled by these companies; but such is not the case, and estimates of the amount which passes into the market through private channels must necessarily be based upon very slight information, and be correspondingly liable to error.

The third system, which is the one that has been adopted, as far as possible, by the census, is what may be known as the direct method. Carried out fully, it would consist in obtaining directly from each bullion-producer a statement of the amount produced. In the case of the larger mines and smelting works, by which much the greater proportion of the precious metals is produced, this plan has been carried out with success. It has been found impossible, however, to use it in the case of the smaller

producers, and therefore recourse was had to other methods. Mr. King found the following obstacles to the full application of his system: the wide extent of the field; the vast number of mines, a large proportion of which are in localities difficult of access; the reluctance of some mine-owners and superintendents to give accounts of their product, coupled with the fact that in a great many cases no systematic accounts were kept by the mine-owners, especially the smaller ones. Many mines had changed hands during the year, and others which had been worked a part of the year were shut down at the time the investigation was in progress. The fact that the census year does not correspond with the fiscal year also made it difficult for not a few of the corporations to give the required figures.

The following table summarizes the figures of Mr. King's report so far as they relate to the total production in the United States. The production is given in dollars:

	Deep Mines.	Placer Mines.	All Mines.	
			Gold.	Silver.
Alabama	1,301	....	1,301	....
Alaska	....	6,002	5,951	51
Arizona	2,307,534	30,256	211,965	2,325,825
California	9,652,575	8,049,253	17,150,941	1,150,887

In the production of gold California still takes the lead. The great deposits of auriferous gravel continue to yield largely, though their final exhaustion, under the wholesale hydraulic operations now being actively prosecuted, cannot be far away. Prior to the discovery of the Bodie district, these and the other superficial deposits supplied more than two-thirds of the entire gold product of the State; but the Bodie and the other deep mines now make the product of the two classes of mines about equal. California produces comparatively little silver, and that from two adjoining counties, Inyo and Mono. In this State there is a larger number of actively-worked mines than in any other, owing chiefly to the settled conditions, the facilities for transportation, and the cheapness of labor and supplies. On this account it is possible to work mines of a lower grade of ore than in most of the other States and Territories. The State furnishes 71.47 per cent., or nearly three-fourths, of the total placer product of the country; and 40 per cent. of the total gold product of the deep mines, or between 51 and 52 per cent. of the total gold product of the United States. Its yield of silver is but 2.8 per cent. of the whole. The interests of the State, however, are not centred in its mining industry, as of late years agriculture and manufactures have assumed greater relative importance.

The mining industry of Nevada shows a considerable decrease, in consequence of the diminished yield of the Comstock lode. From 1871 to 1879 Nevada stood at the head of the States and Territories as a producer of the precious metals, but during the census year both California and Colorado outstripped it. In 1876, the Comstock yielded a total of $38,572,984; but during the census year the product of the whole Comstock district was but $6,922,330—a decline of $31,650,654, or more than 82 per cent., in four years. The placer mines of this State are insignificant, no gravel deposits of importance having a suitable water supply being known. Their aggregate yield is estimated to be but little more than fifty thousand dollars.

The bullion product of Utah is remarkably steady, varying but little from one year to another. The principal yield comes from a few rich claims which are largely in the hands of corporations, and the bulk of the ore is treated by a limited number of mills and smelting-works. The placer yield of the Territory is inferior even to that of Nevada, being estimated at about twenty thousand dollars.

The mining industry of Arizona was but slightly developed at the time of the census investigation. Since that date the development has been very great, a number of mines having become heavy producers. Owing in great measure to the unsettled condition of the mining industry, which at that time was mostly in the prospecting stage, the statistics cannot be regarded as possessing a high degree of accuracy; indeed, Mr. King states that they contain a probable error of at least 20 per cent. The principal production has been from the mines in Pima County, and consists largely of silver.

Although Idaho has produced precious metals during the last twenty years, its mineral resources have still been but slightly developed. During the past four years its production has been confined almost entirely to the older mining districts, of which the placer mines of the Boisé basin have contributed a large proportion. The Owyhee mines, whose production was formerly very considerable, suspended operations in 1876, as a result of the financial crash in San Francisco. Since the close of the census year the Wood River and other districts in and about the Salmon River mountains have been discovered, and now promise large returns of the precious metals. Of the total gold product, about 60 per cent. is from placer and 40 from deep mines. The Territory furnishes 7.33 per cent. of the total placer product of the country, 2.81 per cent. of the deep-mine gold, and 4.43 per cent. of the total gold production. Of the silver production it yielded 1.13 per cent., and 2.61 per cent. of the entire product of the precious metals in the country.

Although Oregon is one of the oldest of the Western mining States, its output has never been large, and mining has always been secondary to agriculture. The greater part of its production is from Baker County, in the eastern portion of the State. The prevailing type of the ores is a free gold quartz. Of the total production of the country, its yield is 7.71 per cent.

The precious-metal production of Washington Territory is of little importance, four-fifths of it being from placers, one-half of which comes from the Upper Columbia. The Skagit mines, which recently caused much excitement, have not as yet proved to be productive. The deep mines of the Territory are practically confined to the Peshaston district in Yakima County, where gold-quartz mining is conducted on a small scale.

Recent reports from Alaska of the discovery of very extensive and rich silver deposits have drawn thither large numbers of persons, but thus far only to be disappointed. The sole returns from the Territory up to the close of the census year consisted of a small amount of placer gold.

Colorado, which up to 1877 produced annually an average of three or four millions, has suddenly, with the discovery of the silver deposits at Leadville, come to the front, ranking first for its silver output and fourth for its gold. During the census year its production of gold and silver was, in round numbers, nineteen and a quarter millions, and, adding to this the value of lead and copper produced, the total metallic product was twenty-two and three-quarters millions. A full collection of statistics in this State was in the highest degree difficult to obtain on account of the unsettled condition of the industry, the immense number of mining claims held by private parties, and the sporadic character of the work being done upon them. Moreover, a large proportion of the ore was shipped east directly, or in the form of lead bullion. The character of the ores and of the mineral deposits presents the greatest possible variety, defying all known modes of classification. Lake County, in which are situated the Leadville deposits, is, of course, by far the heaviest producer, contributing more than two-thirds of the entire product of the State. Gilpin and Clear Creek, each producing nearly two millions of dollars, follow next in order. The mines of these counties were among those first worked. The placer mines of the State, which, shortly after the discovery of mineral deposits, produced very heavily, now furnish only about one hundred thousand dollars to the total production.

The mineral deposits of Dakota are confined to the region of the Black Hills, and the productive mines are almost entirely deep mines of free-milling gold quartz, of a very low grade. The average assay value of these ores is only about eight dollars per ton, but many of the mines, by reason of the great abundance of the ore and the cheapness of its extraction, are extremely profitable. The production of the placer mines is surprisingly small, being only about fifty thousand dollars.

Montana possesses all the elements favorable for a large production—namely, rich and varied ores and abundant fuel, both coal and wood; as yet, however, it has not taken a high rank, because of the want of development and transportation. The discoveries of the rich deposits at Butte will undoubtedly raise the production very considerably in the immediate future, and the opening up of the Territory by the railroads which are now being constructed within it will probably bring to light other equally promising fields. During the census year the principal production came from Deer Lodge County, in which ore having an assay value of more than four millions was raised during the census year. The placer deposits of the Territory formed an important source of its production during the census year, being estimated by the Mint Bureau at more than a million dollars, or nearly one-fourth of the total production of the Territory.

During the census year the mines of New Mexico attracted much attention, but their development has to a certain extent awaited the completion of the railroads through the Territory. Indian difficulties, too, have been another cause of delay, the miners having been repeatedly driven out of a number of the richest districts. Large extents of placer grounds known to be extremely rich have thus far been allowed to lie idle, on account of the difficulty, indeed in most cases, the impossibility, of obtaining water. During the census year there is no report of any production from the placer grounds of the Territory.

Wyoming, although surrounded on three sides by important mining regions, has thus far developed very little in the way of mineral deposits. The only ones known at present are those at the east base of the Wind River Mountains, in Sweetwater County, which produced during the census year but little more than seventeen thousand dollars.

In concluding his report, Mr. King remarks

that the outlook for the future of the mining industry in precious metals is very promising. This view seems to be sustained by the reports of production during the calendar year just passed, for which Mr. Valentine reports a total production of $76,947,515, in the proportion of $31,869,686 gold and $45,077,829 silver.

PERSONAL GOVERNMENT AND ENGLISH DEMOCRACY.

LONDON, March 14, 1882.

WHOEVER has been accustomed to reflect on the course of public affairs must have noted the great effect produced from time to time on opinion by current terms, phrases, or catchwords. Of formulas such as the "sovereignty of the people," the "rights of man," "liberty, equality, and fraternity," the claims of "nationality," which have in their day shaken the civilized world, there is no need to say anything. I can better illustrate my meaning by referring to minor phrases or maxims which within my own memory have assuredly exercised no small weight on the sentiment and the judgment, and therefore on the action, of Englishmen. Thus the need of having "the right man in the right place," the danger of "the tyranny of majorities," the "duties of property," the wisdom of substituting "lateral" for "vertical" extension of the suffrage, the "representation of minorities," the inexpediency of "concurrent endowment," or the expediency of "levelling up" instead of "levelling down," with a score more of expressions or sayings, have within the last thirty years counted for a good deal in the making up of that public opinion which is, or is supposed to be, the ultimate authority in English politics. All these expressions and others like them are vague, indefinite, and from their very nature inaccurate. But it is from their vagueness and from their pliability that they derive their force. They represent not the thoughts but the sentiment of the hour: they betray the general tone of feeling prevalent among large classes. It is therefore always worth while to examine with care and impartiality what is the idea or feeling which the catchword of the time contains, and to ascertain what may be its amount of truth or falsehood.

One of the notions which, as far as I can judge, has at the present moment most currency among the well-to-do and, therefore, roughly speaking, the conservative classes of English society, is the danger of "personal government." The circumstances which have given rise to this sentiment are obvious. It takes no acuteness to see that admiration for individuals has been the special weakness of the French democracy. It is, again, clear that under the rule of Lord Beaconsfield, no less than of Mr. Gladstone, the individual peculiarities of the Prime Minister have exerted great influence on the course of English politics. It is therefore easy to conclude that modern democracies tend to create systems of "personal government," and further to infer that this tendency is purely evil and must be denounced as a rock ahead. Nor is it possible to overlook the fact that to the preachers who warn us against the dangers of personal government, their text, as is often the case in a sermon, is of far less interest than its practical application. Writers who honestly enough dread what I take it you would call the "one-man power," are much less concerned to establish any speculative doctrine than to enforce the practical conclusion that the influence of "one man," namely, Mr. Gladstone, "has," if I may borrow a formula from the politics of the last century, "increased, is increasing, and ought to be diminished." Here, in fact, we are brought face to face with the worst intellectual result produced on Englishmen by public life—the ineradicable habit of enlisting general principles, or so-called general principles, into the service of party warfare. This vice deprives the speculations even of Burke of half their permanent value, and writers who have not a tithe of Burke's genius to sacrifice, are quite as ready as he was to give up to party thoughts and theories which were meant for mankind. It is indeed odd enough to observe how readily the very class of writers who when the American democracy was in trouble turned against republican government all the paradoxes and half truths of Carlyle, now arm themselves against the democracy of England with the maxims of De Tocqueville, and apply or misapply warnings needed by France during the whole period of De Tocqueville's public life to the totally different circumstances of modern England. While, however, it were folly to disguise from one's self that theoretical fear of individual despotism is often, in writers who give the cue to public feeling, a mere cloak of very actual dislike to Mr. Gladstone, it would be a great mistake for one who like myself is neither a vehement opponent nor an undiscriminating admirer of that Minister, to overlook the fact that the language current about personal government does express a genuine and prevalent idea. My object is therefore to estimate, as fairly as I can, the real relation of personal government and English democracy.

"Personal government" is, as I have before pointed out in your pages, an ambiguous term. When it is used with any strictness, it is nothing more than a synonym for our old friend tyranny or despotism. It is a term strictly applicable to the rule of men such as Cæsar, Cromwell, or the two Napoleons. It may be applied with some laxity, but without essential incorrectness, to the kind of administration which George III. attempted to establish during the earlier part of his reign, and did actually establish during the Ministry of Lord North. The essential feature of genuine personal government is that a ruler who cannot be removed, and who cannot be made responsible for his acts, has predominant power in the state. He may be competent or incompetent. He may or may not be the representative of genuine popular conviction. He may owe his power to armed force, to an original popular vote, or to his hereditary position. But whatever the other characteristics of his rule, the despot who maintains a system of personal government is beyond the reach of regular legal control. Any one who believes that the errors of freedom are in the long run a less evil than even the wisdom of despotism—and this is the fundamental dogma of all genuine Liberals both in England and in the United States—must at once admit that "personal government," as contrasted with the government of the nation by the nation, is an undoubted evil; and that modern democracy, in so far as it promotes personal government, promotes a state of things hostile to all true and permanent progress. But I may almost venture to assume that there is no Tory or Home Ruler insane enough to dream that Mr. Gladstone will play the part of Cromwell or of Napoleon. I say that I "almost" venture on this assumption, because in a periodical purporting to be specially addressed to educated men I saw last night the statement deliberately put forward that Mr. Gladstone, both in character and in policy, bears the closest resemblance to James I.; and the man who can trace a likeness between the present Premier and the most learned fool in Christendom may, for aught I know, believe that Mr. Gladstone meditates an armed *coup d'état*. But, putting aside the dreams of fanatics the violence of whose hatred has deprived them of sane judgment, it may be safely assumed that no one supposes that England stands in danger of a Gladstonian despotism. Those who apply the expression personal government to any form of administration which has, or does, or can exist in modern England, use the word in a secondary and almost metaphorical sense.

For "personal government" means, in the mouths of those who connect it with the tendencies of English democracy, not despotism, but the condition of things under which the will of one man, in virtue of the confidence reposed in him by the nation, exerts great or predominant influence on the course of politics. There is not, it must be granted, the remotest doubt that personal government has in this sense, from time to time, existed in England. Chatham, Pitt, Lord Palmerston, Lord Beaconsfield were each, during part of their career, able from their position and character to impress their own personal will, ideas, or fancies on the whole policy and legislation of Great Britain. Whoever will be at the pains to read any of the memoirs which have thrown such abundant light on the reign of George III. will easily come to the conclusion that personal government, be it a bane or a blessing, is no novelty. The language, for example, used by rivals no less than by followers about Pitt, implies that at one time he was not so much the leader as the master of his colleagues. The way in which his influence and importance are spoken of would assuredly be denounced as servile adulation if employed by any of Mr. Gladstone's Cabinet with regard to the authority of their head. I am not, however, the least concerned to deny that Mr. Gladstone's individuality does exert predominant influence in the Cabinet and throughout the Liberal party. It is quite true, and this truth is a most serious and important truth, that England is at this moment to a great extent governed in accordance with the ideas of one man. It must further, I think, be conceded that whenever this kind of personal government exists, the direct power of the House of Commons is lessened. If Mr. Gladstone is bent on a course of action which, as in the case of his perfectly just determination to introduce the *clôture*, is disapproved of by many of his party, it is pretty certain that as things now stand it is not the Premier who will have to give way. Members elected to follow Mr. Gladstone are compelled to play the part of followers. They feel, consciously or unconsciously, that if it came to a conflict between the Prime Minister and a body of Liberal seceders, the constituencies would probably support Mr. Gladstone. I must further in candor grant, that in my judgment the English democracy will, in the long run, tend to produce a system of personal government in the only sense in which that term can be applied to an English cabinet. I come to this conclusion partly from observing the course of politics since 1868. Whether Lord Beaconsfield or Mr. Gladstone has been in power, one thing has remained unchanged: the Premier for the time being has overshadowed both his colleagues and his party. The elections of 1874 and the elections of 1880 were as distinctly contests between Mr. Gladstone and his rival, as if each of them had stood as candidate for the Premiership. But my belief that English electors will, on the whole, wish to place wide powers in the hands of the leading statesman in whom for the time being they have confidence, rests less on the experience of what, after all, is a very short period, than on the general character both of Englishmen and of democracies. An ordinary elector feels—and, I think, rightly feels—that he can form a far sounder judgment on the character and the general tendencies of a leader than on the details of intricate political questions. An intelligent person, who has read the papers and

has observed Mr. Gladstone's career, may say to himself with much more confidence, "I am willing" or "I am not willing," as the case may be, "to trust Mr. Gladstone's conduct of public affairs," than "I have a distinct opinion as to the right policy to be pursued in Ireland or in Egypt." Add to this that a person undoubtedly is more interesting to masses of men than a principle. When Mr. Gladstone "stumped" Midlothian, he excited an amount of interest in his cause which could have been kindled by no mere impersonal appeal, either to reason or to feeling. Moreover, Parliament, which means in reality the House of Commons, is not a body to impress the imagination of multitudes. One may be devoted to parliamentary government, one may hold, as I do hold, that it is on the whole the best form of government which has as yet been discovered by man. But parliamentary government is, one must nevertheless admit, a form of government which is apt to be wanting in dignity and in visible effectiveness. The House of Commons wastes time in debates which are neither instructive nor interesting. It does get through a good deal of business, but the one thing visible to the public is that the House is always in arrears with its work. It is always, as Dickens would phrase it, "trying how not to do it," and in this negative effort the House attains constant and depressing success. Thoughtful democrats will therefore tend to throw power into the hands of some leader who is able to make Parliament work with effect. The less thoughtful electors will feel more and more that a known and admired individual, such as Palmerston, Lord Beaconsfield, or Mr. Gladstone, interests them far more keenly than does the House of Commons or the individual members (often commonplace persons enough) who make up the House. Every motive, in short, good and bad, will therefore lead the English democracy to favor that kind of "personal government" under which one man practically elected by and representing the majority of the electors has predominant authority.

Is the growth in England of such personal government as I have described in reality an evil? There are, as it seems to me, valid reasons for answering this inquiry in the negative.

The supremacy, in the first place, of a leading statesman, trusted by the majority of the country, in no way imperils national sovereignty. The loss of popular confidence entails the loss of power. Let it be once ascertained that Mr. Gladstone is no longer trusted by the electors, and a fall of Mr. Gladstone's Government is, we may be certain, at hand. The question, as long as England has a free Parliament and a free press, will never be, as it has often been in France, between the claim of some saviour of society to rule the nation and the right of the nation to rule itself. The only question which can arise must lie between the right of the electors to choose the Premier and fix the general outlines of his policy, and the claim of the House of Commons to elect the Government and actively to control the Executive. On the whole, whenever there exists a statesman of commanding powers, there is every reason to hold that it is better for the nation that he should as far as possible derive his power from the people, and not be trammelled by the intervention of the House of Commons in matters of government. Parliamentary government is excellent. It still remains to be proved whether government by Parliament is in the long run possible, and if it be possible whether it be tolerable. The English democracy are amply justified in preferring that the Executive should be strong. Parliament itself has never done its proper work, has never maintained popular respect, and has never produced effective legislation except under vigorous guidance. England has been great not when Prime Ministers were weak, but when some Premier of genius commanded Parliament because he represented the nation. It is a plain truth, which one would think hardly more disputable than that two and two make four, that a committee of 600 and odd gentlemen cannot govern an Empire; they could not govern a parish. Such a committee does, however, form, under good guidance, a most valuable body of critics. To create and support a vigorous Ministry—that is, a Ministry to a certain extent independent of Parliamentary factions and Parliamentary intrigues—is therefore the one mode of making Parliament itself really efficient.

It is, in the second place, perfectly clear that the electors, who are in the last resort the sovereign power in England, will in some way or other make their will felt. Two ways present themselves in which large bodies of men may exert their authority. The one is the system apparently favored by Mr. Chamberlain, and of which the readers of the *Nation* know much more than I. This system consists in the enforcing of the strictest party discipline, and forming that kind of "machine" which appears to be much better known than admired by Americans who have at heart the welfare of their country. The other mode of bringing the will of the people to bear, is to induce the electors to place confidence in the leading statesmen with whose views they in the main agree, and in whose character and abilities they have trust. This is the system of "personal government" in its best form, and my belief is that in England the ultimate choice is between such personal government and the "machine." If I am right in this conclusion, the *Nation* and its readers will not be hard to persuade that I am right in preferring the influence of a popular Minister to the power of political mechanism. On this matter there are two things which ought to be borne in mind. No man can obtain in England the influence of Palmerston, Gladstone, Disraeli, or Bright without being long and well known to the electors. He must make his character and his way of looking at politics thoroughly well known to them. He must explain to them, so that every man in England may understand his meaning, what are his principles of government. No man till he has done this can, under the present condition of English politics, be a great popular leader. Hence, it ought to be quite possible for the English democracy to combine allegiance to persons with care for principles, and in such personal allegiance will, it is to be hoped, be found a check on the tendency, fostered by men like Cobden, to regard the whole policy of the nation as subordinate to the success of some one cause.

It should, again, be observed that if the English electors place men to a certain extent above measures, they will be following in spirit one of what used to be considered the soundest of Conservative maxims. We used to be told, and certainly with some truth, that an elector could judge of the character and capacity of a candidate far better than of abstract questions of principle. He could tell that Squire A was a sensible, honest gentleman, and that Lawyer B was a sly, pettifogging scoundrel. He therefore acted wisely in electing the respectable though Conservative landowner in preference to the plausible Radical attorney. English democrats are now showing a tendency to apply this principle on a larger scale. They know the character and antecedents of say Mr. Bright or Mr. Gladstone. They send Mr. Bright or Mr. Gladstone to power mainly because they trust in the character of known leaders. In this I see little to regret, though of course every sensible person will admit that the principle of "men," not "measures," has, like every other principle, its weak side.

A. V. Dicey.

THE BRADLAUGH CASE IN ITS LATEST PHASE.

London, March 15, 1882.

We have now entered the third act of the Bradlaugh drama. To us it has become a tedious drama, but to you it must seem so strange, so all but inexplicable, that a letter may well be devoted to explaining the phases it has passed through, and the reasons why it has roused so much warmth of feeling.

Till 1880 Mr. Bradlaugh was known merely as a secularist lecturer, against whom a prosecution (which ultimately failed) had been directed for publishing a book charged with being injurious to public morals, and whose attacks on Christianity, as well as on the Crown and several of the other institutions of the country, had won for him a certain measure of notoriety. He was, however, in no sense a political power; his following was confined to a small section of the working class, and it was rather by his anti-religious than by his political opinions that this section was attracted. For a good many years he had kept himself before the electors of Northampton, where the shoemakers, who form a large part of the population, are extreme Radicals. He contested the borough once or twice; but his Radical adherents were not strong enough to carry him, because the Nonconformists and other Liberals professing Christianity wholly refused to vote for him, and no one would consent to fight along with him in the Liberal interest. In 1880, however, political excitement had risen much higher than on any previous occasion for a long while. No moderate Liberal candidate could be induced to stand for Northampton, because Mr. Bradlaugh's party, though unable to get him in, were able, by giving their votes to him alone, to prevent another Liberal from succeeding. At last, however, a candidate appeared whose political programme was as advanced as Mr. Bradlaugh's, and who consented to run along with him. The recognized manager of the Liberal party, from his office in London, approved their joint candidature. The Nonconformists, in the excitement of the moment, waived their religious objections, and Mr. Bradlaugh, to the astonishment of the country, was returned. When he presented himself in May, 1880, to take his seat in the House of Commons, he asked permission to make an affirmation, such as our statutes provide to be taken in courts of justice by persons who object to an oath. The Parliamentary oath is a short and simple one, but it ends with the words, "So help me, God!" and these words he, not believing in any Supreme Being, claimed not to be obliged to use. The Speaker doubted whether the statute to which he appealed had any application to the Parliamentary oath, and accordingly a committee was appointed to consider the point. When it came to the conclusion that he could not, under the statutes, affirm as he desired, he then claimed to be permitted to take the usual oath in the usual way. A watchful Tory member, however, interposed before he had well begun the ceremony; the Speaker allowed the objection, and a second committee was, after much wrangling, named to consider whether he could be prevented from taking the oath. This committee also reported against his claim, and when he reappeared to take the oath, the House refused to suffer him to do so by a majority of forty-five. He persisted, however, and, being directed by the Speaker to withdraw, refused to do so, so that he was taken into custody by the Sergeant-at-Arms, after a very un-

edifying scene of disorder. Next day he was discharged, because the House did not know what to do with its prisoner, and left at large, while forbidden to take his seat. At length, the position growing more awkward the longer it lasted, Mr. Gladstone took the matter up, and proposed that persons claiming to affirm should be allowed to do so at their own peril, subject to the decision of a court of law. The statute prescribing the Parliamentary oath provides that whoever votes or speaks without having taken it shall forfeit £500 for every offence, and shall vacate his seat. Thus a means was furnished of trying the question at law. Mr. Bradlaugh made the affirmation, and then voted. An action was brought against him for the penalty, which, after the lapse of eight months, during several of which he had sat and spoken, was decided against him. Thus his seat became vacant, and the first act in the drama came to an end.

The second opened with his offering himself again at Northampton and being reëlected. Proceeding once more to the House of Commons, he now declared himself ready to take the oath in the usual way, which he had previously declined. But his opponents were more than ever on the alert. They now insisted that he could not be permitted to take the oath, because he had previously declared that it was not binding on his conscience, since the words, "So help me, God!" had no meaning for him. It would, they urged, be a profanation of the oath, an insult to the Deity and to Parliament, to allow the words of the oath to be repeated, and God to be appealed to by one who knew no God at all—to whom the words were so much idle gibberish. To these arguments it was answered that the House of Commons had nothing to do with the administration of the oath, and no right to inquire into the mental state of the person who took it: all that the statute required was that the words should be duly repeated and the ceremony performed; if they saw and heard him do what others did, that was enough. Moreover, he had been reëlected, and such knowledge as they had obtained of his opinions by what he stated when he was a member before, and came up asking to affirm in 1880, must now be put out of sight, since he now appeared with the new title to sit derived from his second election in 1881. These considerations were urged by one or two Liberal lawyers and by Mr. Gladstone, who, though he did not make the question a matter of confidence in the Government, was evidently anxious to have it settled. But the House of Commons decided by a pretty large majority not to permit Mr. Bradlaugh to take the oath, and when he persisted in coming forward again and again, passed a resolution directing the Sergeant-at-Arms to exclude him from the precincts of the House. Insisting, however, that it was his duty to take his seat, and that the House was acting illegally in keeping him out, he forced his way into the lobby one day last summer, and had to be removed by force, after an unseemly scuffle. When this session began, and he presented himself as usual to take the oath (the resolution of last session for his exclusion having expired), Sir Stafford Northcote, as leader of the Tory party, again proposed that he should not be permitted to take the oath, and again carried his proposal against the Government, by a majority of about sixty. Three weeks afterward, Mr. Bradlaugh, having carefully chosen his opportunity, darted up the floor of the House one evening, to the table, and there administered the oath to himself before anybody had time to move the Speaker to interpose and stop him. Alleging that he had thus satisfied the statute, he took his seat and voted in a division. This open defiance of its authority irritated the House, so, after a tumultuous debate, the Conservative leader carried his summary expulsion. Mr. Gladstone and many of the Liberals, condemning his conduct as disrespectful to the House, declined to vote, but about eighty still supported him, on the ground that his offence did not deserve expulsion, and that the question whether he had vacated his seat ought to be regularly tried.

With this expulsion—an extreme penalty, which the House of Commons has the legal right to inflict, rarely as it has been inflicted—the second act of the drama was wound up. Most people thought, and many Liberals as well as nearly all Tories hoped, that the whole play had ended. They were tired of Mr. Bradlaugh, and expected to see him no more, because they conceived that the borough of Northampton would disapprove of his principles and his conduct, and, perceiving that Parliament was resolved not to have him, would choose some other representative. In so reasoning they forgot to allow for the dogged persistency of the English character, and that tendency to sympathize with any man, however little they may otherwise like him, who seems to be getting less than justice. Had Parliament been dissolved and an election taken place in the ordinary course of things, it is almost certain that Mr. Bradlaugh would have lost his seat. The Nonconformists would have been swayed by their old dislike of his secularism, and without the Nonconformists his own special partisans could have done but little. His expulsion, however, had raised the feeling of the town in his favor. Northampton felt itself pitted against the House of Commons, and determined to show that it could be as obstinate as the House. Accordingly, Mr. Bradlaugh was again returned, by a smaller majority no doubt, but after such great efforts by his opponents that it was plain that the whole Liberal party in the town was disposed to stand by him and back him up in his struggle with the House of Commons. That struggle immediately recommenced; for as soon as his election had been announced, and before he appeared applying to be sworn, Sir Stafford Northcote once more moved and carried a resolution forbidding him to take the oath. An amendment was moved by one of the Liberals who had formerly opposed his admission, declaring that some measure ought to be introduced permitting an affirmation in lieu of an oath; and this being put as an alternative to Sir Stafford Northcote's resolution, was lost by sixteen votes only. The result has been to leave things exactly where they were before. Mr. Bradlaugh is member for Northampton, but cannot take his seat, cannot vote or speak, because he has not taken the oath, and cannot take the oath because the majority of the House of Commons will not let him—a strange and uncomfortable predicament for all parties; but nobody seems to know how to get out of it. One person, however, has seen what is the logical result of the action of the House of Commons. This is Lord Redesdale, an old-fashioned and sternly-consistent Tory, who has introduced in the House of Lords a bill providing that every member of either House of Parliament shall before admission solemnly declare his belief in Almighty God. The notion of imposing a new theological test at this time of day has caused some amusement, and the bill will of course never pass even the House of Lords.

What, then, some one may ask, is the explanation of the behavior of the House of Commons? Why should it be thought absurd for Lord Redesdale to propose formally what they have done practically? The answer is that they have been drawn on, step by step, into their present position, and that they have been governed not so much by general principles applicable to the case of every person who, being an unbeliever, should offer to take the oath, as by dislike to the particular man in whose person the case has arisen for solution. When the first objection was taken nearly two years ago, it was laid hold of by the Tories, then smarting from their defeat at the polls, as an unexpected means of harassing the Liberal Ministry. Soon they became interested in the struggle, their animosity to Mr. Bradlaugh increasing with his persistency, and their dislike to his taking the oath, which at first seemed in some of them not altogether sincere, having now become a strong and earnest feeling. Although not many would go so far as to say that all atheists or pantheists ought to be absolutely excluded from Parliament, a great many really think so, and are glad of the opportunity of excluding one who has become conspicuous by his attacks on religion. Among the Liberals few would confess to such a feeling, and all are sensible of the mischief done to the party by keeping the question open. The Government have suffered in credit by having been overridden by the majority of the House; the party as a whole suffers by being mixed up in the minds of respectable people with an unpopular personality. Nevertheless, a large number of Liberals inside the House of Commons have steadily voted, against their party leaders, to prevent Mr. Bradlaugh's being permitted to take the oath, and a considerable body of Liberal opinion in the country, particularly in Scotland and the North of Ireland, supports the same view.

They are swayed by a mixture of feelings. In the first place, they think that as he began by declaring that the oath was meaningless to him, it would now be enacting a solemn farce to let him repeat its words. The oath would be desecrated, the House would be stultified; public respect for the sanctity of such a solemn appeal to Heaven would be gravely shaken. Then, further, they have conceived a horror of Mr. Bradlaugh's views—not merely his political and anti-religious views, but his declarations on other moral and social questions as to which public opinion in England is very sensitive. His presence in the great legislative assembly of the nation seems to them a misfortune, which they would willingly avert. If there were no technical objection to his entering it, why of course he must be allowed to enter; but when there is such an objection, they are not eager to remove it. And lastly, they fear that if they should vote for his admission their vote would be misunderstood by pious and respectable men among their constituents. They would be thought to be "voting for Bradlaugh"—*i.e.*, voting for a man who has spent his life in diffusing doctrines which most well-conducted people hold in horror. The electors, they fear, would make no fine distinctions as to the legal points in the case, but would simply consider that a member who voted to admit Mr. Bradlaugh voted in his favor, and thereby expressed sympathy with his position and his views. Under these combined influences of personal feeling and fear of misconception, a considerable number of Liberal members have either abstained from voting or have voted with the Tories for the exclusion of the member for Northampton; and it has now apparently become too late to get the matter considered as a mere dry legal question, with which the doctrines or behavior of the individual has nothing to do.

How will the problem be solved? The obvious solution is to pass an act abolishing the oath of allegiance altogether (a rational course, for which people seem hardly prepared), or permitting any person who does not wish to take the oath to make an affirmation instead, as various classes of persons are now allowed to do in courts of justice. There would be a majority in the House of

Lords against any such measure ; and probably the House of Lords in its present warlike temper might reject it. It would, moreover, be so strenuously opposed by the Tory party in the House of Commons that much precious time might be spent in carrying it, and not merely spent but lost, if it were to be rejected by the Lords. This is probably the reason why Mr. Gladstone refuses to take the matter up. Although he has of course great aversion to Mr. Bradlaugh's opinions, he has been so much annoyed by the behavior of the House that he would gladly see the question settled by the admission of the excluded member. That must come sooner or later ; the only question is, whether the Tory party will be able to keep the sore open till a general election is at hand, in the hope that the Radical party may be discredited by their support of Mr. Bradlaugh's claims.

However small the legal question involved, the case becomes instructive when one sees in it an instance of the perplexities in which assemblies become involved by the necessity of observing fixed rules. Here is a purely technical matter which, with a little common sense, might have been disposed of in a few hours had people been so willing. Party spirit getting hold of it, and taking advantage of the forms of the House of Commons, makes out of it a problem which has cost weeks already, and is as far as ever from solution. It is also an instance of the way in which men tend to confound an abstract principle with a concrete example. The fact that Mr. Bradlaugh is an atheist and an assailant of the monarchy looms so large before people's minds, that they cannot or will not consider whether the House of Commons has not gone beyond its strict legal right in keeping him out. "Ought atheists to be legislators?" "Is not Christianity a part of the Constitution?" These and similar questions are the questions which we hear put, as if the point of law were to be decided by them. Yet nobody would have thought of putting them in the case of any man elected a member who might, like Mr. J. S. Mill, have written books in which the existence of a Deity was questioned. Everybody knows that there are already in Parliament persons who make no secret of their disbelief. No one, except Lord Redesdale, thinks of interfering with them. But Mr. Bradlaugh is thought fair game. Nor can those who pursue him be brought to see that they are really making him and his opinions far more familiar to and influential with the working classes than they could otherwise have become. It is lucky that there is no revolutionary party in England now, for if there were, Mr. Bradlaugh's case would go far to rouse it into action, and to provoke a quarrel between the House of Commons and the masses. B.

Correspondence.

THE CHINESE AND THE DEMAGOGUES.

To the Editor of The Nation :

Sir : Although I am a constant reader of the *Nation*, I have never been more deeply impressed than I was by your late article on the Chinese Bill, which I see from the newspapers has just passed also the lower house of Congress. I was in California when the measure was first brought forward in the United States Senate, and when it was exciting the greatest interest, I might say, among all classes of the population of the Pacific coast. In connection with your comments, made respecting the speech of Mr. George of Mississippi, in the Senate, "in which he assumes the bill to be a confession that this is 'a white man's government,'" I was much struck with one argument I remembered as having been used, in discussing this same subject, by some of the most intelligent men of San Francisco, at the time I have referred to. This was, that every Californian should profit by the sad, but at the same time perfectly logical, result of the powers granted the negroes, as in Virginia, and avoid at once in California every possibility of similar occurrences, and the great dangers, not to speak of the disgrace, attending them.

The present political revolution in Virginia, one of the oldest and most conservative communities of the country—involving the repudiation of a great part of the State debt, and the changes for the worse in its judiciary, together with the total disorganization in the management, not only of the charitable, but even of the educational State institutions—brought about by Senator Mahone, by means of the vote of nearly the entire negro population, has had no little influence, I assure you, in alarming even the less intelligent here as to what may be in store for every community on this coast with a Denis Kearney in the place of Mahone, using for his own ends the balance of power which the Chinese too, if the negroes are to be upheld, will surely gain through the ballot with time and any further increase in their number.

Respectfully, C. M. B.

Tucson, Arizona, March 24, 1882.

LANGE'S 'ALTERTHUEMER.'

To the Editor of The Nation :

Sir : A "Note" in the *Nation* of February 16 recalls to my mind studies once pursued with ardor, but for some time pressed aside by more urgent duties. Speaking of Madvig's 'Verfassung und Verwaltung des Römischen Staates,' you refer to the "great works" of Mommsen-Marquardt and Lange. Objection should be taken, I think, to the commendation of Lange here implied, as misleading to the student who looks to the German scholar for something more than a collection of facts—for a comprehensive, judicious presentation of the development of Roman institutions. Going over such a battle-ground for scholars as the early history of Rome is, it is important that the student should estimate the real value of a work to which he may trust for guidance in respect to its treatment of the history as a whole ; in respect to what I may call its *statesmanlike touch*. It is important to judge how it grasps the constitutional growth of Rome, as the modern historian grasps the constitutional growth of England, for example—as a reality to be illustrated and explained by the critical ingenuity of scholars, not as a proposition of historical dialectics to be maintained and controverted by successive generations of disputants. Judged by this test, I do not think Lange's 'Alterthümer' can fairly be called a great book. Extensive it certainly is, and with great apparent erudition in the foot-notes, though I think serious exception can be taken to it in this respect.

It is of course not to be expected that the most careful student will verify the majority of the references in the foot-notes of such a work as Lange's. But he must feel confidence that his author has done so, that they really represent what the text claims they do, and are supports of the positions taken in the text. A very extended and thorough use of Lange gave me reason to doubt that the notes are of this kind. Frequent attempts at verification led me to the conclusion that, to a considerable degree, these notes are simply transferences at second or third hand, without verification, from numerous other modern historians and compilers. Compared with the full and accurate quotations of the Mommsen-Marquardt series, of Mommsen's essays, of Schwegler's history, they are almost worthless.

This is, however, a small matter compared with the defect in the work I have implied above—its failure to grasp Roman history as an organic whole, with a vital and real development, which determined the character of the several institutions, and which must be the guiding line of valuable criticism on its several parts. This broad, statesmanlike perception of Roman constitutional growth is one of the great features of Mommsen's work—perhaps the greatest feature of his History, and hardly less noticeable in the masterly essays, published (I believe) in 1864, under the title, 'Römische Forschungen.' Here we have a most acute scholar, as his book on the tribes shows, applying himself to the study of institutions in such a way that it is always the statesmanly instinct which directs and holds in hand the exercise of that critical argumentation and ingenuity which sometimes run away with other Germans. Here, it seems to me, Lange falls far short. He has none of the broad, strong grasp on Roman polity which I have just spoken of as characteristic of Mommsen. His ingenuity is ingenuity pure and simple, with no other necessary connection with Roman history than that the latter affords the subject of its exercise.

In illustration of what I mean, take Lange's complicated, artificial, and improbable notion of the *patrum auctoritas* and *lex curiata de imperio ;* or, as a better illustration, and one which goes deeper into the character of the political life of the early republic, the way in which he discusses the relation of the *plebs* to the curiate assembly. After Mommsen had well-nigh demonstrated the presence of the plebs in the *curiæ* and the *comitia curiata*, at a very early period, Lange, feeling the force of Mommsen's argument, but unable to see that this is a great political factor in the institutions of Rome, a probable or improbable result of the development of Roman institutions, to be passed on as fact, in its entirety ; and also unable to see that the theory of their exclusion is purely artificial, the result of Niebuhr's critical, but sometimes extravagant, reconstruction of Roman history—Lange, I say, unable to judge of historical facts as such, and unwilling to abandon a theory entirely, invents a compromise which he passes as history.

This letter is too long already, but an old enthusiasm for the study of the Roman Constitution was awakened by your Note, and I have hoped to induce the small number of special students of this subject to carefulness in their reading.—Yours very truly,

D. W. Brown.

New York.

[In speaking of Lange's book as "great," we had reference of course to its size. We should not call the Becker-Marquardt work "great" in any other sense : the Mommsen-Marquardt treatise is the only one to which this epithet will apply in any broader sense. But while admitting that Lange is not a great writer, in the sense in which Mommsen and Niebuhr are great, and that he has not the deep and intuitive insight of these writers—that he fails in a degree "to grasp Roman history as an organic whole, with a vital and real development"—his book is nevertheless one that we value highly and make constant use of. No writer has worked out so satisfactorily and completely the patriarchal institutions out of which the Roman institutions grew ; and the chapters upon the constitu-

tional history of Rome which occupy part of the third volume and the whole of the fourth, while, it is true, principally made up of detail, are nevertheless the best book of reference for these details. If not a "great" book, it is a very useful one.—Ed. Nation.]

Notes.

Houghton, Mifflin & Co. will publish, by subscription, in an elegant edition, limited to 1,000 copies, 'English and Scottish Popular Ballads,' edited in their entirety and purity by Prof. Francis J. Child, of Harvard University. They have also in press 'The Gipsies,' by Charles G. Leland.

Cassell & Co. will shortly have ready 'The Constitution of the United States,' a popular exposition by Simon Sterne, of the New York Bar.

We understand that Mr. F. H. Underwood, whose sketch of the poet Lowell has lately been published by J. R. Osgood & Co., is now well advanced in the preparation of his biography of Longfellow, projected and begun over a year ago, and aided by frequent counsels and suggestions from Mr. Longfellow, who had also chosen most of the subjects to be used as illustrations. Messrs. Osgood hope to have it ready in a few weeks, as the pictures are now well advanced. They will include the ancestral home at Newbury, the birthplace of the poet at Portland, and other scenes of similar character.

Alfred Barbou's 'Victor Hugo and His Times,' translated by Ellen E. Frewer, and profusely illustrated, is announced by Harper & Bros., as also a work on 'The New York Volunteer Fire Department,' by George W. Sheldon.

Henry Holt & Co.'s announcements include the second volumes of Cory's 'Guide to Modern English History' and of Fyffe's 'History of Modern Europe'; Lady Jackson's 'The Old Régime'; J. A. Doyle's 'English Colonization of America'; Frances Anne Kemble's 'Records of Later Times'; Bernhard Ten Brink's 'English Literature'; and Heine's 'Romantic School.'

A new and uniform edition of Mr. T. W. Higginson's works, and new editions of Wendell Phillips's 'Speeches and Lectures' and 'Scholar in a Republic' (the latter with an appendix containing Mr. Phillips's plan of civil-service reform), and of Mrs. Mann's 'Life of Horace Mann,' are promised by Lee & Shepard.

'The Geological and Mineral Resources of the James River Valley of Virginia,' by Dr. J. L. Campbell, is in the press of G. P. Putnam's Sons.

Peter G. Thomson, Cincinnati, issues immediately General J. D. Cox's 'Second Battle of Bull Run, as connected with the Fitz-John Porter Case.'

'American Caves,' from an historical, scientific, and descriptive point of view, by Professor H. C. Hovey, is the title of a work announced by Robert Clarke & Co.

Of timely interest is the 'Walking Guide to the White Mountains,' by a member of the Appalachian Club, which will have the imprint of A. Williams & Co., Boston.

'Hunting and Trapping,' six months in winter camp in the Maine wilderness, by Captain F. C. Barker and J. S. Danforth, will be published this month by D. Lothrop & Co., Boston.

The Soule Photograph Company, Boston, succeeds John P. Soule in the business of photographic art reproductions, so long and favorably known to the public. The new firm consists of Messrs. W. B. Everett and W. S. Soule.

The *Journal of Nervous and Mental Disease* (Putnam's), formerly edited by Dr. I. S. Jewell, of Chicago, begins its ninth volume with a new editor, Dr. W. J. Morton, of New York, and with a large and attractive number of 240 pages. In two long articles Drs. Beard and Hammond urge that, while Guiteau is a lunatic, he is or may be at the same time deserving of punishment—a view of the relations between medical and legal insanity much more familiar to alienists in Europe than to those in this country. The *Journal* will, no doubt, be attractive reading to others than specialists.

Those interested in the education of defectives will find much that is valuable in the modest little pamphlet on the 'Education of the Blind,' from the pen of Mr. M. Anagnos, Boston. A hasty and popularly written sketch of the condition of the blind from the middle of the seventeenth century to the present is followed by an account of the Perkins Institution, of which the author is the head, and of Dr. Howe and Laura Bridgman. Mr. Anagnos is his own publisher.

Macmillan & Co. will shortly bring out Matthew Arnold's 'Irish Essays' and J. P. Mahaffy's 'Decay of Modern Preaching.'

Under the title of 'One of Cleopatra's Nights, and Other Romances' (New York: R. Worthington), Mr. Lafcadio Hearn has translated Gautier's charming dream-stories into English with a scholarly understanding of their mythological and historical basis, and with such rare insight and sympathy, as well as skill and taste in reproducing phraseology, that the author's glowing fancies and grace and delicacy of style are even more noticeable to a foreigner than in the original. Comparing the translation with the French, it proves to be perfect in every respect, excepting a few words that might have been better chosen.

Three instalments of the 'History of the Second Massachusetts Regiment of Infantry' have recently been published in Boston. Captain Geo. A. Thayer writes of the part taken by the regiment at Chancellorsville, Colonel Charles F. Morse describes Gettysburg, and Captain Samuel M. Quincy reproduces his diary, kept while a prisoner of war, between August and November, 1862. Each of these papers was read at one of the annual reunions of the officers. Of their great value, not only as material for military history, but also as graphic pictures of the every-day life of the rank and file during the great war, there can be no question, and no stronger evidence could be produced of the high character of the famous Second Massachusetts than these three admirable papers, showing the culture and education of the men who were company-officers in that regiment. Captain Thayer's paper not only describes the part played by his regiment at Chancellorsville, but gives an excellent summary of the principal features of the whole battle.

Marcus Ward & Co., 734 Broadway, send us a great variety of floral emblems in the shape of Easter cards. While most of them are fine specimens of color-printing, the range of both designs and mottoes is inferior to that of the Prang series noticed last week.

E. C. Bridgman, 83 Warren Street, sends us his new railroad and township wall map of New York State, which is on a scale of five miles to the inch. The lettering is bold and distinct. In the free spaces are given the whole of Long Island, at scale, a ward map of New York city, a map of the whole United States, and various tables of statistics—population, Congressional districts, railroad distances, post-offices, express companies, etc. As railroads in process of building (like the West Side and the New York, Lackawanna and Western) are represented as complete, the map in this respect will be less out of date a year or two hence than now.

Late in life Mr. Tennyson took up dramatic writing, and saw three of his plays acted on the stage. Mr. Tupper is moved by the same tardy spirit. W. H. Allen & Co., London, announce as in press "Three Five-Act Plays and Twelve Dramatic Scenes, suitable for recitation and home theatricals. By Martin F. Tupper, D.C.L., F.R.S., author of 'Proverbial Philosophy.'" It will be remembered that Mr. Tupper kindly wrote a drama about Washington at the time of our Centennial Celebration, and not long after Mr. Tennyson had published "Queen Mary."

Mr. Henry B. Wheatley has recently published in a thin volume (London: Elliot Stock; New York: Scribner & Welford) a paper on 'Bookbinding Considered as a Fine Art, Mechanical Art, and Manufacture,' which was read by him two years ago before the Society of Arts. In so contracted a space the essayist must perforce take a hasty view of a widely extended subject; and this paper is therefore of less interest and value than Mr. Cundall's volume, and than the admirably illustrated book of Mr. Zaensdorf, both of which are about contemporaneous with its delivery originally. But anything is to be welcomed which draws attention to the fact that bookbinding is an art and not a mere mechanical process. Mr. Wheatley's essay is illustrated by eleven plates, all more or less rough. The most important is an English binding of the sixteenth century from Queen Elizabeth's library, with the badge of her mother, Anne Boleyn.

—At the last meeting of the Biological Society of Washington, Dr. Elliott Coues laid before the members the advance sheets of his latest contribution to ornithology, about to be published in Boston by Estes & Lauriat. This work is ostensibly the second edition of his 'Check List of North American Birds,' published in 1874, but enlarged to include a lexicon of the etymology, orthography, and orthoepy of the scientific names of North American birds, a concordance of previous lists, and a catalogue of the author's ornithological publications, some 300 in number. In his remarks on recent advances in the study of ornithology, Dr. Coues sketched the progress of our knowledge of North American birds under heads of the Wilsonian, the Audubonian, the Bairdian, and the modern periods, showing that in round numbers the current lists of birds of each of these periods increased by 200 names—the Wilsonian showing 300, the Audubonian 500, the Bairdian 700, and the present one 900. The total number of names in Dr. Coues's new list is 888, being an increase of 120 over the 768 tenable names of the original edition of 1874. A portion of this accession results from the formal inclusion of Greenland birds in the North American list; and another large portion from discoveries of species over our Mexican border and in Alaska. The speaker stated that some twenty or thirty, perhaps, of his 888 species or sub-species might not be regarded by all persons as valid; and with this margin of probable reduction of his figures, making due allowance for probable discoveries, he presumed that the list of North American birds, stragglers, etc., included, would finally settle at about 900. The novel feature of Dr. Coues's work was stated to consist in the philological character of the explanation it gives of the derivation and application of the technical names. Every word, both generic and specific, is defined, with the usual diacritical marks of quantity and accent. The "Roman" pronunciation is adopted and recommended. The treatise makes a royal octavo of some 200 pages.

—Surgeon Joseph R. Smith, United States Army, has prepared a paper concerning the 'Retired List of the Army,' which has considerable interest at the present time, in view of the provision in the Army Appropriation Bill now pending in the House of Representa-

tives, which places all officers on the retired list when they reach the age of sixty-two. He shows that the retired list originated in 1861, and under the laws then and subsequently passed it now consists of five different classes of officers—namely, (1) those retired on their own application after forty years of service, (2) those retired on the report of a Board as being incapacitated for active service, (3) those retired in the discretion of the President after forty-five years of service, or having attained the age of sixty-two years, (4) those retired on their own application, in the discretion of the President, after thirty years of service, and (5) those restored to the service and placed on the retired list by Act of Congress. The whole number at present is limited to 400, and three-fourths of them are included in the second class. The whole number retired in twenty years has been 583. The mortality in the first and third classes (those retired for age) has been about 6 per cent. per annum, while in the second class (retired for wounds) it has been less than 4 per cent. The mortality among officers on the active list in the last twenty years has been 1.36 per cent., excluding losses in battle, and 1.94 per cent., including such losses. The great number of officers, of the same average age, placed in the Army upon the reorganization at the close of the war, has now brought about such a stagnation in promotion as very seriously to affect its *morale*. Officers are attaining their fiftieth year while still captains, and their sixtieth year as majors; more than one-third of the first lieutenants of infantry are over forty years of age, and a large proportion of officers have been serving from fifteen to twenty years in one grade. The result is that officers pass the prime of their life in subordinate positions without responsibility, and only attain the more important positions at such an advanced age and so little accustomed to responsibility that their usefulness is greatly diminished. In order to remove this stagnation, at least in part, it is now proposed to remove the restriction as to numbers on the retired list, and to apply to the Army the same law that has been found to work very well in the Navy for the past twenty years—viz., that every officer *shall* be placed on the retired list on attaining the age of sixty-two. It is found on examination that under such a law forty-two officers would be retired during the present year and smaller numbers on succeeding years, the number reaching 119 in the space of six years. Surgeon Smith's paper is in advocacy of such a law, and the statistics and arguments which he presents are valuable and interesting.

— The total number of students in attendance at the University of Michigan this year is 1,534, just the same as the total given in the annual calendar for 1880–81. Compared with last year, the Department of Law and the School of Pharmacy have made slight gains. In no department has there been any material loss. In point of numbers this university has risen rapidly, till it now holds the leading position among the higher educational institutions of the country. Organized and conducted primarily for the purpose of meeting the wants of citizens of Michigan, it pursues a wise and generous policy toward students coming from other States and countries. At the present time only forty-five per cent. of its students have their homes in Michigan. The number of women in attendance is about one hundred and eighty, or nearly twelve per cent. In the department of literature, science, and the arts, or, as it might be called, the collegiate department, students are allowed a wide though not unlimited choice of studies. The aim appears to be to secure the benefits and to avoid the dangers of the elective system by prescribing a part of the work to be done by the candidates for the several literary degrees, or by requiring the student to elect a specified amount of work from limited groups of studies. The announcement of the organization of a School of Political Science, and a description of some of the studies to be pursued in the School, appear for the first time in the calendar for the current year.

—The first volume of Dr. Hayman's edition of the Odyssey, containing the first six books, appeared in 1866; the second, containing the next six books, in 1873; and the third volume, covering the remaining twelve books of the poem, is now published (London: David Nutt; New York: B. Westermann & Co.). Soon after the appearance of the second volume, in the spring of 1874, the trouble which the editor had been having with the assistant masters and with the governing body of Rugby School came to an end in his dismissal from the head-mastership. To this he makes indignant and pathetic reference in the preface to the third volume and in the Greek motto (Od. 14, 372 f., which runs thus in English: "But as for me, I dwell apart by the swine and go not to the city"). The whole work is a monument of untiring industry and perseverance, which does not flag even in the last twelve books of the poem, where most readers find their interest somewhat languid except at one or two points. As a contribution to Homeric scholarship, the chief value of this edition lies in its marginal references to occurrences of words and phrases in other parts of both Homeric poems. These will be used, however, mainly by specialists in the study of Homer, while the discussions in the prefaces and appendices contain matter interesting to other scholars. Those in the first volume, it is true, are confined mainly to the history of the text of Homer and to discussions of the characters and language of the poems. But before the second volume appeared, Mr. F. A. Paley had set forth, in the prefaces to his edition of the 'Iliad,' a theory in regard to the late origin of the present form of the Homeric poems, arguing that it was not earlier than the Peloponnesian war. This led Dr. Hayman to devote the prefaces to his second and third volumes, of 138 and 152 pages respectively, to a minute discussion of the evidences of a knowledge of the poems as we have them, and of the use of the art of writing for literary purposes, for a century or two earlier than that time. Mr. Paley's theory has produced a great many magazine articles and pamphlets, but, so far as we know, he has made only two converts, Prof. A. H. Sayce, in England, and Dr. Johannes Overdick (*absit omen!*), in Germany. Whatever we may think of the wisdom of adding two hundred pages on such a subject to an edition of a classical author, there can be no doubt that there is much valuable matter in Dr. Hayman's essays, and very little doubt that he leaves the Paleian theory in a rather mournful condition.

—Berlioz's symphony of "Romeo and Juliet," which will receive its first complete representation in New York at the sixth concert of the Symphony Society next Saturday, is spoken of as follows in an article by M. Blaze de Bury in the *Revue des Deux Mondes* for March 15:

"'Romeo and Juliet' is a tragedy which has come down from the stage into the orchestra. It not only undertakes to depict the psychologic state of two lovers, their ardors, their frenzy, their despair; it does more: the entire drama is unfolded, scene by scene, and without words; the altercation between the domestics at the rising of the curtain; the intervention of the prince as a peace-maker; the ball of the Capulets—and all this splendid, imposing, inspiring; possessing an interest at once musical and dramatic; a Delacroix set to orchestral music, with a programme written by Shakspere."

The article in question is devoted to Schubert and his indebtedness to Diderot's novel of 'La Religieuse,' and abounds in bold epigrams which almost defy translation. Among other brilliant things in his essay, M. de Bury cites a long conversation which he once held with Musset concerning Schubert. "What secrets this man possessed," said Musset. "Do you know a single voice of nature of which he has not caught the individuality? . . . Truly, an incomparable landscapist." Further on we are told that the influence of the piano was so powerful on Schubert that his most beautiful songs make the impression of *études* for the piano with a human-voice accompaniment. Again, Schubert is the most modern of the moderns. His music is impregnated with the picturesque and with literature. Music was architectural with Sebastian Bach, sentimental and psychologic with Haydn and Mozart, the art of pure thought with Beethoven, and in Franz Schubert turned to the picturesque.

—In the same number of the *Revue* M. Othenin d'Haussonville, one of the French delegates to the Yorktown celebration, prints the second instalment of his American diary. It is throughout almost always laudatory, the writer evidently feeling that the cordial reception given to our visitors and the great pains that were taken to make their stay agreeable forbade his saying anything that could offend American susceptibilities. It is worth noting that he collected a great deal of correct information, although he does not entirely escape the mistakes to which travellers in general and Frenchmen in particular are liable in judging of foreign countries. Thus, in mentioning that the corner-stone of the monument at Yorktown was laid by the Grand Master of Masons instead of President Arthur, he expresses a doubt whether this circumstance, in spite of the very simple explanation it received, did not point to a dangerous increase of the influence of the Freemasons on public affairs. Our public men generally made a favorable impression on him, and he was particularly pleased with General Sherman, whose appearance was about what he had imagined—at once martial and unaffected, half soldier, half gentleman-farmer, a Davout tempered by a Bugeaud.

—The Academy of Sciences, Paris, has lately awarded the Valz Astronomical Prize to Mr. David Gill, Her Majesty's astronomer at the Cape of Good Hope. Mr. Gill has devoted his time most energetically for many years past to researches on the distance of the sun, and it is in recognition of this service that the award of the Valz Prize has been made to him—especially in consideration of his observations of Mars, at the Island of Ascension, in 1877, as discussed in a recent volume of the Memoirs of the Royal Astronomical Society. The committee was of opinion that the expedition to Ascension was fully successful, as Mr. Gill obtained twenty-two series of observations of the planet, each of which gives a value of the parallax of the sun; and the value resulting from a combination of all these was considered one of the most exact yet obtained. The astronomical prizes offered by the Academy for the present year are the Lalande and the Valz Prizes, and a renewal of the Damoiseau Prize, 10,000 francs in value, for a review of the theory of the satellites of Jupiter—this subject having been first proposed in 1869, and renewed four times since, no memoir having so far been presented to the Academy which could be regarded as meriting the award.

—Nothing is more bewildering to students in the field of Biblical criticism than the manifold attempts to harmonize the chronology of the Hebrew Scriptures with that of the Assyrians, Babylonians, Egyptians, and Persians, as re-

corded in the cuneiform and hieroglyphic inscriptions, in the Canon of Ptolemy, the fragments of Manetho and Berosus, Herodotus, etc. Some of the works devoted to the subject are perfect mazes of speculation, computation, and conjecture. Such is preëminently Johann Raška's 'Die Chronologie der Bibel im Einklange mit der Zeitrechnung der Egypter and Assyrier' (Vienna, 1878). Less extensive, but more perplexing in its method and execution, and surpassingly venturesome in its conjectural flights, is Victor Floigl's 'Geschichte des Semitischen Altertums in Tabellen' (Leipzig, 1882), with introductory elucidations, which has so speedily followed the same author's 'Cyrus und Herodot nach den neugefundenen Keilinschriften' (Leipzig, 1881). Both these bold, if not reckless, reconstructors of ancient chronology are Austrian provincial scholars, Raška being professor at Budweis, and Floigl dating his preface at Gratz. A less ambitious, and, we believe, much sounder, attempt in the same sphere is Heinrich Matzat's (a Prussian provincial teacher) 'Chronologische Untersuchungen zur Geschichte der Könige von Juda und Israel' (Weilburg, 1880). But the best recently published summary of the ancient history of the states east and west of the Euphrates is Fritz Hommel's 'Abriss der babylonisch-assyrischen und israelitischen Geschichte . . . in Tabellenform' (Leipzig, 1880). This little book presents in a succinct and clear manner the most generally adopted results of recent investigation, and will be found a very handy companion by teachers as well as students.

— Scholars in this country have often deplored the fact that they were cut off from one attractive and valuable class of studies, that of palæography and its application to textual criticism. The improved methods of photographical printing, however, are gradually bringing within their reach treasures heretofore locked up in European libraries. We need not refer to the facsimiles of classical and Oriental manuscripts which have been published lately in Germany and England, but will pass to a more restricted and less-known field, that of Romance palæography. Until quite recently even the most famous monuments of the French language were accessible only in the unsatisfactory facsimiles in Roquefort's 'Glossaire,' and Chevallet's 'Origine et Formation de la Langue Française.' In 1875 Gaston Paris published for the Société des Anciens Textes Français superb heliogravures of the 'Oaths,' 'St. Eulalie,' 'The Passion,' 'St. Leger,' and the 'Fragment' of Valenciennes. Three years later Prof. Stengel, of Marburg, had the Bodleian MS. (Digby 23) of the 'Chanson de Roland' photographed entire and published in that form by Henninger, of Heilbronn. Although the appearance of such a book will not compare with that of the work before mentioned, it is on the whole the most satisfactory process, and there is a sentimental feeling of satisfaction and security in using the direct photograph which one does not experience with the other methods, though they may be as safe. The next essay in this direction was by Professor E. Monaci, of Rome, who published the 'Provençal Mystery of St. Agnes.' The favorable reception accorded to this work has induced Signor Monaci to undertake other similar ones, the first of which is before us. Part 1 contains twenty-five sheets of heliotype facsimiles printed upon hand-made paper, and is sold at the very low price of twelve francs. The manuscripts, with two exceptions, are from Roman libraries, and contain Old French, Provençal, Catalan, Spanish, and Italian texts. A brief notice directs attention to printed editions of texts (where such exist), and to detailed descriptions of the MSS. The four Provençal texts are from the two famous Vatican MSS. (5232, 3207) of the thirteenth and fourteenth centuries, and consist of biographies of several troubadours, parts of *canzoni*, and a portion of a short treatise on Provençal poetry. Among the old French texts the most valuable are the Glosses of Cassel, here given entire in seven sheets, and the fragment of the poem on Alexander the Great (first published by Heyse, 'Romanische Inedita,' 1856), in two sheets, which may be had separately for the use of students. The Italian texts consist of a Latin legal document, dated 1193, and containing an admixture of Italian words, a formula of confession in Latin and Italian, an extract from a volume of annals of Perugia, the beginning of a will (Siena, 1367), one hundred and eleven verses from the 'Tesoretto' of Brunetto Latini, and an extract from G. Villani's 'Chronicle.' This last MS. is the only one that possesses any artistic interest. At the bottom of the page is a miniature representing the execution of the unfortunate Conradin. We trust that Signor Monaci's enterprise may meet with the warm encouragement of Romance scholars in this country, who ought to be especially grateful for such publications. The same publishers announce an *Archivio Paleografico Italiano* conducted by E. Monaci and C. Paoli. It will appear at irregular intervals, in numbers of about ten sheets, of the same form, we presume, as the 'Facsimili.'

SYMONDS'S RENAISSANCE IN ITALY.

Renaissance in Italy. By John Addington Symonds. 2 vols. Part 1. The Age of the Despots. Part 2. The Revival of Learning. New York: Henry Holt & Co. 1881.

It is pleasant to chronicle the issue of an American edition of Mr. Symonds's history of the Renaissance in a style quite worthy to be compared with the original. Such American spellings as *theater, center, meäger, equaled, practiced*, strike the eye; and we note an occasional misprint, as *adventures* for *adventurers*, i., p. 131; *villians*, p. 147; *credible* for *creditable*, p. 185; *imperasse* for *imperasset*, p. 180. But, on the whole, the reprint is as correct as it is elegant.

These books have so high and well-established a reputation that it would seem hardly necessary to do more than mention their publication. But we understand that the issue of part 3, "The Fine Arts," is conditional upon the reception accorded to these volumes; we wish, therefore, to express very heartily our gratification at the undertaking, and to hope that it will prove a success in every respect. In order to emphasize more strongly the importance of the work, it will be well to call attention more particularly to the character of the epoch and to Mr. Symonds's treatment of it. The great reawakening of the fifteenth century is largely associated in our minds with inventions and discoveries—the invention of printing and the discovery of America are perhaps the two things that occur to us first in connection with it. With neither of these fields did the "Renaissance in Italy" have much to do: Columbus and Cabot were Italians, to be sure, but it was as Spaniard and Englishman that they made their voyages. It was upon classical literature and art that the activity of Italy was exercised at this period: "It was the duty of Italy in the fifteenth century," says our author, ii., p. 321, ". . . to resuscitate culture." To each of these two topics, therefore—the revival of learning and the fine arts—the author has devoted a volume; an introductory volume undertakes to characterize the age in its political and historical character—this is 'The Age of the Despots.'

The state of society depicted in these two volumes is without question the foulest of which we have any record. We cannot say that it was worse in reality than that of Rome in the early empire, or of Greece in its decline, for there is no description of society in those earlier periods so complete and detailed as that which we are enabled to construct of the period before us; but, so far as we possess the materials for a comparison, the fifteenth century of our era must be pronounced worse than the first. We have no knowledge, in all human history, of anything so profoundly and universally corrupt. When, in part 1, the reader comes to the account of a prince, Duke Frederick of Urbino, distinguished for integrity, good faith, and personal purity; or, in part 2, to the description of a scholar, Vittorino da Feltre, at once learned, simple, and pious, he is struck with a certain sense of unreality and incongruity. Is it possible that characters like these could be produced in such an age as this? Of course, as such examples show, there were exceptions to the general demoralization, and Mr. Symonds denies (part 1, p. 488) "that the humanities of the race at large . . . were vitiated." He adds that "the immorality of the age descended from the upper stratum of society downwards." Here, we imagine, is the great contrast between the corruption of this age and that of the early Roman Empire. Whatever virtue survived in ancient Rome was in the upper classes—the representatives, so far as they were to be found, of the genuine Romans of the Republic. In the period before us, the people at large retained something of practical Christianity when it had wholly vanished from the upper clergy and the nobility.

This will serve to explain the fact that the picture of the age, painted by itself, is so much worse in the period of the Renaissance than in the Roman Empire. The Latin writers belonged to that class in which survived whatever good there was. They were patriots, Stoics, men of austere morality, in whom still lived something of that spirit which sacrificed everything for the common good. In this age of the decay of paganism men still admired virtue, and placed before themselves a high standard of purity and integrity. In the last days of the mediæval Church, on the other hand, virtue itself was no longer praised—the very name had lost its signification: the standard of conduct was vice. There was no Persius or Juvenal to hold the age up to scorn; there was no Tacitus to depict with loathing the crimes of princes; there was no Lucan to sing of heroic deeds; among the soldiers of Italy there was no Agricola, among her philosophers no Seneca, among her sovereigns no Trajan or Marcus Aurelius. The foulest writers of Greece and Rome would have found congenial companions among the most eminent churchmen and most distinguished humanists of the Italian Renaissance.

The causes of this ineffable depravity are to be found partly in the political demoralization of mediæval Italy, partly in the condition of the Church at this epoch. The former topic is largely illustrated throughout the volume; the latter forms the subject of a special chapter—"The Church and Morality." A rapid examination of the earlier history of Italy shows why it was that no union of the peninsula was possible during the Middle Ages; and why, therefore, at the threshold of modern history, it fell a prey to foreign invaders. The selfish "particularism" of the Italian states goes a great way to explain the universal bad faith, unscrupulousness, and want of genuine patriotism of the public men of this period; their incredible inhumanity was a natural enough outgrowth of their selfish isolation; and when men are perfidious and cruel, licentiousness is not far distant. The moral sense

has already been destroyed. But even this sequence and development of vice seem inadequate to explain corruption such as existed at this period. Mr. Symonds proceeds boldly—but after all treading in the footsteps of Machiavelli and Guicciardini—to lay it to the charge of the corrupt and worldly Church. It was not merely that the ecclesiastical system of the Middle Ages proved ineffective to prevent immorality; it was not merely the example of popes like John XXIII. and Alexander VI.; it was the false standard of conduct sedulously inculcated and made into a rule of practice—a rule which burned Huss and Savonarola and made Cæsar Borgia a cardinal. The causes of "the inherent feebleness of Italy" in respect to spirituality and morality are summed up in vol. i., page 455, as "an intellectual apathy toward religious questions, produced partly by the stigma attaching to unorthodoxy; partly by the absorbing interests of secular culture; partly by the worldliness of the Renaissance; partly by the infamy of the ecclesiastics; and partly by the enervating influence of tyrannies." All of these receive ample illustration in these volumes.

Of course a condition of society like this could not endure. It would have speedily conducted mankind into a universal barbarism far worse and more hopeless than that out of which it had emerged generations before. Immorality is compatible with a high state of civilization, but not with the continuance of a high state of civilization. The terrible sack of Rome by the mercenaries of Charles V. was the crisis in the moral history of Italy. "From the shame and torment of that sack she [Rome] never recovered, never became again the gay, licentious, lovely capital of arts and letters; the glittering, gilded Rome of Leo" (p. 445). But "the Papal state had learned by its misfortunes the necessity of a reform. . . . No force of arms could prevent the Holy City from returning to a better life, and proving that the Christian priesthood was not a mere mockery and sham. In truth, the counter-Reformation may be said to date historically from 1527."

Part 1, "The Age of the Despots," is the volume which possesses most interest for the general reader; the second part, upon the "Revival of Letters," will be very acceptable to those who wish to obtain a clear and connected idea of this great era of scholarship, and to have the names of the leading humanists something more than names to them. The humanistic movement, our author thinks, may be said to have passed through four distinct phases or periods. The first, that of Petrarch, was "the age of inspiration and discovery." The second, associated with Poggio Fiorentino, was "the age of arrangement and translation." The third is "the age of academies"—"whereof the Platonic Academy at Florence, that of Pontanus at Naples, that of Pomponius Lætus in Rome, and that of Aldus Manutius at Venice, are the most important. . . . At the same time, Italian erudition reaches its maximum in Poliziano." The fourth is "the age of the purists, over whom Bembo exercises the sway of a dictator." This is in reality a period of decay. This volume, besides an elaborate sketch of each of these periods, has a chapter upon "Latin Poetry" and a concluding chapter.

We do not understand the definition of *municipality*, given part 1, p. 195: "To begin with, the Italian republics were municipalities. That is, like the Greek states, they consisted of a small body of burghers who alone had the privileges of government, together with a larger population who, although they paid taxes and shared the commercial and social advantages of the city, had no voice in its administration." This defines correctly the citizenship both of the Greek cities and the Italian republics; but neither the Greek cities nor the Italian republics were true municipalities. The Greek cities were sovereignties in the fullest sense of the word, and the Italian republics were sovereignties to all intents and purposes, even though some of them might owe a nominal allegiance to some lord, and all of them, except Venice, were in theory subject to the Emperor. But the very essence of a municipality is that it is not sovereign—that it forms part of a larger organism in which sovereignty resides; the municipality exercises only delegated authority over purely local concerns. There is a slight inconsistency in speaking of Isabella, wife of Gian Galeazzo Sforza: page 543 she is correctly spoken of as daughter of Alfonso II., of Naples, but page 555 she is called his sister.

THE PAINTER COPLEY.

The Domestic and Artistic Life of John Singleton Copley, R. A. With notices of his works, and Reminiscences of his son, Lord Lyndhurst, Lord High Chancellor of Great Britain. By his granddaughter, Martha Babcock Amory. Boston: Houghton, Mifflin & Co. 1882. Pp. 478.

THIS labor of love on the part of the late Mrs. Charles Amory will doubtless meet the fate of the thousands of other useless biographies. The materials so carefully collected and copied seem of priceless value to the editor, but they are hastily glanced over by the unsympathetic reader in quest of new facts or equally desirable amusement. The volume is composed mainly of family letters, of interest only to the recipients at the time, and of no value to any one at the present day. At best it may be said that they prove a lively attachment between the members of the Copley family, and give a touch of human warmth to our impressions of the learned, stately, and elegant Lord Chancellor.

John Singleton Copley, born in Boston in 1737, of parents who had but lately immigrated, will long be remembered as the great portrait-painter of New England prior to the Revolution. As the artist who perpetuated the faces of the most distinguished gentlemen and ladies of the local aristocracy, he occupies a place analogous to that of Lely and Van Dyke in England. In England, however, where he passed the latter half of his life, he is known as an artist of a certain rank, but more especially as the father of Lord Lyndhurst. The names of the father and son are thus closely united, somewhat as those of the elder Disraeli and Lord Beaconsfield will hereafter be. It is with regret that we add that this book gives us no new information of value in regard to the artist A few references to well-known pictures painted by Copley are no great contribution to history. We had hoped at least for an attempt at a list of Copley's English paintings, somewhat on the plan of the American catalogue published by Mr. A. T. Perkins, of Boston, in 1873. As none is given, we may briefly recapitulate the leading points of Copley's history, correcting some errors of his biographer.

According to Mrs. Amory, the artist's father, Richard Copley, married Mary Singleton, sister of John Singleton, of Quinville Abbey, County Clare, Ireland, and the Copleys were a Yorkshire family long settled in County Limerick. It is added that Richard Copley and his wife went to Boston in 1736, and the former died in the West Indies about the time that his son was born—in 1737. Cunningham, in his 'Life of Copley,' says the artist was born, "by the most credible accounts, at Boston July 3, 1737." From the utter silence of the Boston records it seems most probable that the father did not remain there long, and that Mrs. Copley was soon left a widow. In 1747 the widow Copley married Peter Pelham, an English artist, who had been for some twenty years struggling with untoward fate in uncongenial Boston. "Though engaged in trade, like almost all the inhabitants of the North American colonies at that time, his stepfather had some knowledge of art, as many drawings and engravings of tolerable execution by his hand still remain," says this memoir. The newspapers of the date contain a much clearer statement in the month following her marriage. "Mrs. Mary Pelham (formerly the widow Copley on Long Wharf, tobacconist) is removed to Lindel's Row, against the Quaker Meeting House, near the upper end of King Street, Boston, where she continues to sell the best Virginia Tobacco, Cut, Pigtail, and Spun, of all sorts, by Wholesale and Retail, at the cheapest rates." This we print as a sure indication that Mary Singleton, when first left a widow, possessed the energy to maintain herself, and that after her second marriage to a widower with at least three children, she lacked neither ability nor wish to contribute to the support of the new establishment. She lived to a good old age, and the following brief letter, dated Boston, February 6, 1788, is worth copying: "Your fame, my dear son, is sounded by all who are lovers of the art you bid fair to excel in. May God prosper and cause you to succeed in all your undertakings, and enroll your name among the first in your profession." It is not unreasonable to presume that it was from her that Copley and Lyndhurst inherited not only longevity, but those qualities of mind which raised them above their fellows.

According to previous accounts, Copley is here represented as a self-instructed artist, whose excellence was intuitive and wonderful. But an examination of the facts must correct the error. Peter Pelham, his stepfather, was an artist of no small ability. John Chaloner Smith's recent 'Catalogue of British Engravers' shows that Pelham executed some thirty-six mezzotint engravings, more than twenty being published in England before he came hither. These portraits certainly place him in a very good rank among engravers, and would to-day be readily purchased on their merits. Coming to New England about 1726, he must soon have found that there was no large demand for his skill. He taught a school for the education of children in "Reading, Writing, Needlework, Dancing, and the art of Painting upon Glass"; he engraved portraits of a few of the clergymen, and in fact did what he best could to earn an honorable living. After his second marriage he continued his "Writing and Arithmetick School." We will add briefly that success rewarded him; that his oldest son, Charles Pelham, was an honored citizen of Newton, and married a niece of Sir William Pepperell; and that the late distinguished lawyer, Charles P. Curtis, was his grandson. A second son, Peter Pelham, jr., went to Virginia, and was the ancestor of many noted bearers of the name in the South.

It is beyond dispute that Peter Pelham was also an artist with the brush. His engravings testify to this; and one or two specimens remain of the portraits which he painted as preliminary to his use of the graver. Though rather sketchy, they prove his ability to teach all that the master can impart to the readiest pupil. Moreover, in 1753, Copley painted and engraved a portrait of Rev. William Welsteed, of Boston, so evidently in Pelham's style as to render it certain whence he had obtained his instruction. Copley's earliest known picture is a portrait of his stepfather, Pelham; another early production is the portrait of his stepbrother, Charles Pelham; and his first step toward fame was the sending to England that portrait of his half-brother, Henry Pelham,

known as "The Boy with the Squirrel." Again, the well-known artist, John Smibert, lived until 1752 in Boston, and his inventory embraced "thirty-five portraits, forty-one History pieces and pictures in that taste, thirteen Landskips, two conversation pictures, bustoes and figures in Paris plaister and models, prints and books of prints, and drawings." Smibert's son, Nathaniel, pursued his father's art till his death in 1756. John Greenwood (born in 1727) was at this time painting; Richard Jennys, jr., and Nathaniel Hurd, engraving. In fact, the young Copley was reared in the midst of surroundings which impelled him to art; and an examination of his pictures compels us to believe that he was less an artist from overwhelming impulse than from circumstances. In 1767 Copley himself wrote, "I am now in as good business as the poverty of this place will admit. I make as much money as if I were a Raphael or a Correggio; and three hundred guineas a year, my present income, is equal to nine hundred a year in London."

The valuable catalogue of the American portraits painted by Copley, prepared by Mr. A. T. Perkins,* contains notes of some three hundred, executed before the artist left this country. These pictures are of the highest interest historically, and of very high rank artistically. But after Copley had visited Italy in 1774, and taken up his residence in London under the influence of West, he added to his profession of portrait painter that of historical painter. Vast pictures of Scriptural subjects were to the taste of the King, and consequently of the wealthy collectors. Equally large canvases were given to famous events, as the "Death of Chatham," the "Death of Major Peirson," the "Arrest of the Five Members," etc. But many of these pictures remained unsold, and the artist was evidently less prosperous than he would have been had he been less ambitious. From this memoir we learn that the main support of the family during the closing years of the artist was furnished by his learned and devoted son.

The few letters of Copley's herein given are unimportant, and in fact the reader will gain a much better idea of him from Cunningham's well-known 'Life,' brief as it is. So in regard to Lord Lyndhurst: the letters here copied, especially those narrating his visit to America in 1795, are pleasant to read, but they contain nothing of importance. They will be duly prized by his relatives, but the public will not find any cause for wonder that the Lord Chancellor was not deficient in politeness or affection to his nephews and nieces. It is, indeed, rather strange that none of the Boston literati have essayed a suitable memoir of Lyndhurst, certainly one of the most distinguished of all the sons of that goodly city. The subject is a tempting one, for he was eloquent, witty, learned, and successful. English writers protest against Lord Campbell's description of him, but the great party which he served has no longer, apparently, any interest in its past history.

We can only say in conclusion that the article, also by Mrs. Amory, which was printed in *Scribner's Magazine* for March, 1881, contains the essence of this volume. The book will be read by Bostonians, and will perhaps in an abridged form contribute to the reputation of the writer. It is an ungracious task to review a posthumous work, but in this case we presume that nothing more has been printed than the author intended, and its diffuseness is the chief weakness of the book.

On a Raft, and Through the Desert. By Tristram J. Ellis. 2 vols. London: Field & Tuer. Pp. 122, 128. Small 4to, illustrated. 1881.

THIS work, apart from the artistic merit of its numerous etchings, is chiefly interesting for its graphic descriptions of scenes witnessed in the author's search after subjects for an exhibition of paintings. It has the additional value of being the testimony of an eye-witness to the utter misery entailed by Turkish rulers, and the gradual but certain destruction which they are bringing upon their subject peoples. In this respect it should be read in connection with Mr. Tozer's account of his journey through Turkish Armenia, published last year. Both tell the same story of corrupt and inefficient government, of a wasted and despairing people, of famines frequently recurring and inevitable. In all parts of the Turkish Empire traversed by these gentlemen there were but two or three places which showed any signs of prosperity. In one of these, at least, Deir on the Euphrates, the cause was to be found simply in the fact that the Governor, Ali Pasha, was an "honest official." Nearly everywhere, however, both the population and the flocks and herds were decreasing at an alarming rate. Aleppo, for instance, contained more than 300,000 inhabitants fifty years ago; "now there are less than 100,000"; while in the winter of 1879–80 "as many as 240,000 sheep" perished under its walls. This winter was exceptionally severe in the East, and Mr. Ellis, on touching at Sidon, "found the picturesque little town in a great state of agitation. Three inches of snow had fallen—a thing never known or even heard of before. The people were alarmed lest its weight lying on the flat roofs of the houses should break them in. Many were the consultations they held with Mr. Eddy, the American missionary, who had kindly received me as guest, as to what ought to be done. They had such an exaggerated notion of its weight, that they were afraid of sweeping it into the street, lest in falling it should kill the passengers. . . . On account of the unaccustomed cold the people made a change in their clothing, and, as they were quite unused to snow, this took rather a surprising form: they put an extra handkerchief on their heads, and, taking their shoes off for fear they should be spoiled, walked about barefooted."

Our author's route was by steamer from Beyrut to Iskanderoon, "the most unhealthy spot in Syria, or perhaps in the world." Though he only spent one night there, it was long enough for him to have an attack of fever. From thence he went by Antioch and Aleppo to Diarbekir on the Tigris, the true starting-point of his adventurous journey. Just before they reached the city, he says: "We presently met a long line of shivering people that we learnt had been turned out of Diarbekir for fear of pestilence breaking out there. They were slowly making their way westwards, where they had heard there was plenty to eat." Apparently, the only method of descending the Tigris is by rafts, which are constructed in the following manner:

"A number of long, straight boughs of the poplar are lashed together with rope made of bark and fine osier-twigs, so as to form a grill with bars eight inches apart, of the full size of the raft. A few inflated skins are fastened to this, and it is floated out into the shallowest and stillest water available. The rest of the skins are pushed underneath the grill, and tied to it in rows, touching each other, so that the skins completely hide the water. . . . After the inflated skins have been fastened to the grill, the principal framework made from the trunks of poplar-trees is laid over it and firmly tied. Over the whole a flooring of osier-sticks is laid, and upon this the merchandise, or in my case a hut, is placed. As my raft consisted of only 120 skins, and measured about 12 feet by 9 feet, my hut had to be very limited in dimensions. It measured 6 feet by 7 feet 6 inches, and 5 feet 6 inches high. It had a floor of wood. The framework was made of stout branches of trees, and the covering of thick Kurdish felt, quite impervious to the weather. The layer of osier-branches on the raft is very difficult to walk on, as, unless one is very careful, a foot will slip through on to the skins. These give way on each side, and one's leg is in the water in a second. The skins immediately close round the ankle, and it requires the assistance of others to haul one's foot out."

It was with the greatest difficulty that Mr. Ellis could find two raftsmen who were willing to take him to Mosul, as the banks of the river between Diarbekir and this place were lined with a starving people, who stopped every raft in the hope of getting food. The deplorable condition of Mosul, however, had aroused the Government to decided action, and navigation was opened by the aid of soldiers and a mountain battery. Mr. Ellis's raft, containing six persons, was the first to descend the river after the blockade. The voyage was without incident, though there were numerous alarms of robbers. At one point "the scenery became very grand. The precipices grew bolder and higher, with lofty snow-covered mountains in the background. The windings of the river were so sharp that every now and then we seemed rushing headlong into a wall of rock. When within a few feet of it the banks suddenly opened to right or left, and we rushed down that gorge only to see another precipice just before us a few hundred yards off. It required all the skill of the raftsman to prevent the kelek from striking any of the sunken rocks, and, in spite of all precaution, half a dozen skins were broken during the day, each going off with a sudden and discomfiting pop." On his reaching Mosul he found the famine still raging with fearful intensity. "My servant sought in vain for edible bread. He brought in a specimen of the only stuff he could find; it was a cake five inches across and a quarter of an inch thick, made of fine chopped straw, with just enough flour to paste the bits together, and the price demanded was twopence." A few days later none even of this could be had at any price. Though trade generally was at a standstill, the armorers were very busy, as "every one was arming himself against the expected rising" of the poor. In the neighborhood of the bazaars the wretched people were gathered in great numbers.

"Many had sold all their clothes, and were lying, covered with sores and swarming with flies, on the ground, naked except for a dirty rag. They were fearfully emaciated, all their ribs and the articulations of the joints showing with the utmost distinctness. It seemed impossible that such people could live, and on noticing a crowd that had formed round a young man, who had been lying on his face without even a single rag, I went up to see what was the matter. I arrived just in time to see him turned over. He was quite dead. This happened close to a small stall for the sale of cooked gaubs, yet not a morsel had been given him, so selfish did want make even the usually charitable Arabs."

But for the daily distribution of soup at the English Consulate, chiefly through Lady Strangford's agency, many more would have perished.

At Bagdad Mr. Ellis found himself in the midst of entirely different scenes. He was invited to a feast celebrating the marriage of the principal consular dragoman, who was also one of the richest Christians in the city.

"I was surprised that none of the ladies present had dark complexions, being as fair as southern Europeans. Their out-door dress entirely protects them from the sun, and they seem to have none of that dark blood which is prevalent in India. The hair was black, with hardly any exception; the eyebrows and eyes were also dark, but the skin was frequently of an ivory whiteness, sometimes assisted by cosmetics—in fact, there was not a lady there who did not paint her eyes and eyebrows, and there were very few who did not also color their lips and cheeks. The eyes are painted in a way much in advance of ours in Europe. Besides the usual dark line under the lower eyelashes,

* Reviewed in the *Nation*, No. 436, Nov. 6, 1873.

the full thickness of the lower eyelid is stained or painted a deep brown or black, and frequently the upper eyelid is slightly darkened all over, graduated toward the edge. The effect is splendid at a distance, and after a time one gets so much used to seeing it, one scarcely notices the means by which the effect has been obtained. . . . My partner had two large cascades of jewels with pendants hanging down in front from each shoulder, besides half a dozen necklaces, enormous ear-rings, strings of coins in the hair, numerous bracelets and bangles, and rings covering all her fingers up to the first joint. Most of the other ladies were as profusely bedecked. The hair was carefully parted in the middle, and frequently cut in a crop over the forehead, the rest generally hanging down the back in plaits from one to twenty in number, each with a little gold or silver knob at the end."

The most direct way from Bagdad to Damascus, 450 miles distant, is by the desert, which is traversed by the post in ten or twelve days every fortnight. "The carriers are always Bedaween, and [during a service of forty years] scarcely a single instance is known of the letters failing to arrive at the other end." It should be said that all money and valuables are rigidly excluded. To the usual difficulties, however, arising from the scarcity of food and water for the camels, was added at this time the presence of large bands of hostile Bedaween. The alternative routes, however, were so fatiguing, and required so much time, that Mr. Ellis determined to brave the dangers of the desert. We have no space left to follow him in his wanderings by day and night as he successfully strove to elude the Anezeih, the especial friends of Lady Anne Blunt. Damascus was reached on the twenty-second day after leaving Bagdad, the 450 miles having become 750. Of Mr. Ellis's etchings we can only speak in terms of very high praise. The sketch-map accompanying these volumes, though drawn with sufficient accuracy, is disfigured by numerous (we have counted eight) gross typographical blunders. In every other respect the work is an unusually fine specimen of the book-maker's art.

John Quincy Adams. By John T. Morse, Jr. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1882.

No better choice could have been made for a beginning of the important series to be edited by Mr. Morse than the life of John Quincy Adams. Not only did Mr. Adams's great age, the extraordinary precocity and the no less extraordinary persistence of his public career, serve to connect the first days of the republic with the middle and later periods; not only was he Ambassador, Secretary of State, President, and (proudest of all) Representative in Congress; not only did his independence reject the badge of party; but, thanks to his invaluable diary, in the case of no other American statesman is the record so complete, the "human document" so ready to be summed up. Judgments will of course differ as to the greatness or wisdom of Adams, but they need neither await nor expect any further materials. That Mr. Morse's conclusions will in the main be those of posterity, we have very little doubt, and he has set an admirable example to his coadjutors in respect of interesting narrative, just proportion, and judicial candor.

If entire patriotism, incorruptibility, political fairness, prescience, initiative, and high physical and moral courage are the marks of statesmanship, it would be difficult to point to any of his contemporaries or successors who possessed them in an equal degree with Mr. Adams. Forty-eight hours after he had taken his seat in the Massachusetts Senate, as one of the Federalist majority in 1802, the first act of his legislative life was to propose that the Republican minority should enjoy a proportional representation in the Council (the Governor's body of advisors). Yet he had just been spitefully removed by President Jefferson from the position of Commissioner in Bankruptcy. As President he determined (and with Mr. Adams to determine was to act) to renominate every Federal office-holder "against whom there was no complaint which would have warranted his removal." Though desirous of a reëlection, he refused to heed those who exhorted him to make a clean sweep of his political opponents and fill their places with his friends. "An invidious and inquisitorial scrutiny into the personal disposition of public officers will creep through the whole Union, and the most selfish and sordid passions will be kindled into activity to distort the conduct and misrepresent the feelings of men whose places may become the prize of slander upon them." He rated liberty above the Union, and foresaw the dissolution which actually occurred. He menaced slavery with the "war power" long before civil war was imminent. He was almost the sole champion of free speech and the right of petition on the floor of Congress, for more than half a generation, maintaining a veritable state of siege against all the onslaughts of the slave power, until reinforcements could arrive and the defence be committed to younger though not more ardent or able combatants.

Mr. Adams entered the House of Representatives in the same year with the founding of the *Liberator*. The final campaign against slavery was thus simultaneously begun within and without Congress, yet neither ally quite recognized the other. In December, Mr. Adams presented fifteen petitions from Pennsylvania Quakers, asking for the abolition of slavery and the slave-trade in the District of Columbia. He expressed his opinion that the suppression of the slave trade might be a proper subject of legislation, but astonished the Abolitionists by giving notice that he hoped the other subject would not be discussed in the House, and that it would not receive his countenance. This seemed to the editor of the *Liberator* "a trimming policy—an attempt to court Southern popularity," the trifling of a "Northern doughface." Later on, this misunderstanding disappeared, but Mr. Adams always felt uncomfortable under the pressure of the Abolitionists. They were constantly urging him "to indiscreet movements" which would be his "irredeemable ruin in this world." Between them and the "adverse impulses" of his family his mind was "agitated almost to distraction," and he felt himself walking upon the edge of a precipice in every step that he took. Throughout his diary one remarks Mr. Adams's dread of "ruin," which seems paradoxical even when explained to mean a fear of losing the estimation of the public. His Congressional career, with vigilant hostility for his normal condition, as Mr. Morse happily phrases it, has the appearance of the most absolute indifference to public opinion or to future political preferment. Yet he was never as reckless as his enemies thought him, and, while never abating his abhorrence of slavery and contempt of slaveholders, weighed carefully every step, whether personal or official, as if it involved a calamity which we can even now hardly define.

The fact is that this eminent man, who had "a strong natural propensity to give offence and make enemies," who was "an adept in alienation—a novice in conciliation," and was doomed by nature to an austere isolation from his fellows, had an inextinguishable craving for their approval. When they gave him the Presidency, he felt it was only his desert, but he did not cease to exact of them a continuance of their approbation—not in the vulgar form of office, for nothing higher remained, and he cared nothing for the mode or measure of their good opinion. He did extort the respect even of his bitterest foes, but it brought him small comfort, for what he wanted was sympathy. The Abolitionists offered him this as they were able, but he could not reciprocate it. Their allegiance to duty was not more high or more single than his, but they voluntarily accepted the slight and hatred of their countrymen. He watched their progress like a prophet who "sees what he foresaw," but he had no desire to share their odium, or to descend with them into the fiery furnace. He congratulates himself (April 19, 1837—the date is significant) on having escaped it in the late session of Congress, and writes: "It behooves me well to consider my ways before I put myself in the way of being cast into it again. On the other hand," responds his Puritan conscience, "may God preserve me from the craven spirit of shrinking from dangers in the discharge of my duty!"

A Monograph of the Pribylov Group; or, The Seal Islands of Alaska. By Henry W. Elliott. Washington: Government Printing Office. 1881. Pp. 171. With 29 plates, 2 maps, and 12 sketch maps.

THIS is the second of the series of monographs published, or to be published, by the Census Bureau. Mr. Elliott, as a special agent of the Treasury Department, spent more than two years upon the Seal Islands, in 1872-3-4. He tells us that in former times the range of the fur-seal was very greatly extended. It was found in great numbers at many localities in the Antarctic, South Atlantic, and South Pacific oceans; but, being unprotected, it became the prey of the sealing fleets of all nations. As the result of the indiscriminate slaughter which ensued immediately upon their discovery, they were almost exterminated in the Southern hemisphere, and to-day, of the vast rookeries which once existed, there remains only a small one at Cape Corrientes, owned and protected by the Argentine Republic, and a few individuals scattered about along the coast, or upon rocky, uninhabited islets. The fur-seal in the North Pacific, on the other hand, has been found in large numbers in only two localities, the Pribylov and the Commander Islands. The latter are of much less importance than the former, the number of fur-seal taken there annually being less than one-half that taken on the Pribylov Islands, while they are probably worked much more nearly up to their maximum capacity.

The Pribylov islands (St. Paul and St. George) are mere islets in the heart of Behring Sea. For six months of the year they are surrounded by ice, and during the other six months are enveloped in dense fog. They are the breeding-grounds of hosts of seals, which congregate here in dense bodies along the shore, landing in June and remaining until August and September. Their total number upon the two islands is estimated by Mr. Elliott at 4,700,000. The first to arrive upon the islands are the mature males, who at once take up their positions upon the shore, to receive the females as they come. The seals are polygamous, each male having as large a harem as he can obtain by fair or foul means. The natural result is that the younger and weaker males are forced to remain bachelors, and, through fear of the older ones, keep aloof from the rookeries, and are found in droves or herds of thousands scattered along the shore. The adult male seal measures six and a half to seven and a quarter feet in extreme length, and, when in good flesh, weighs 400 to 600 pounds. The female is very much smaller, measuring only four to four and a half feet, and weighing only about one-sixth as much. The pups, when first born, weigh only three to four pounds, and measure twelve to fourteen inches in length.

The Alaska Commercial Company has, by lease, the monopoly of this amphibious stock-yard, under certain restrictions, the principal of which are that no female or pup seals shall be killed, except for food, and that the killing shall be restricted to 100,000 of the young males, or "bachelor seals," annually upon the two islands. These conditions are obviously to the advantage of the company; but Mr. Elliott makes a suspiciously labored argument to prove that the contract has been fulfilled in this respect, and almost casts doubt on his own estimate of the total number of seals on the islands by attempting to show that an annual product of 100,000 skins can be maintained without injury to the stock. That self-interest is not a guarantee against killing the goose that lays the golden egg, our lumber devastation abundantly demonstrates. The killing of the seals is done in June and July, for later than the latter month the skins are not in prime condition. It is conducted in this wise: A body of "bachelors" is surrounded by a dozen natives, who cut off their retreat to the sea, and then gently drive them inland to the killing ground, which is convenient to the village. Arrived there, the seals are killed by blows from clubs, with which their skulls are crushed. The skins are at once taken off and prepared for shipment.

Besides the fur seal, Mr. Elliot treats of the sea-lion and the walrus, and briefly of the feathered tribes which inhabit these islands in the summer. The volume is fully illustrated by maps and sketches made by the author. Of the latter, it is fair to say that while the figures of animals are admirably drawn, the artist has only a shadowy idea of perspective.

Anecdota Oxoniensia. Aryan Series, Vol. I., Part 1. Buddhist Texts from Japan, edited by F. Max Müller, M. A.

By this little publication, the Oxford University has initiated an enterprise of which the plan is wholly praiseworthy, and which may well enough grow into something really important. The intention is, as the prospectus informs us, "to publish materials, chiefly inedited, taken directly from MSS.," especially from those contained in the Oxford libraries; and there are to be four series, namely: Classical, Semitic, Aryan, and Mediæval-Modern. Taking advantage of the extraordinary vogue attaching to anything that bears the name of Prof. Müller, the University issues first a little Sanskrit text, of less than thirty pages (there is added a preface of eighteen pages), containing the *Vajrachedikâ*, or 'Diamond-Cutter,' a Buddhist philosophical treatise of the *Mahâyâna* or Great Vehicle (we might fairly render it "highfaluting") school. The edition is founded on manuscripts or block-books recently brought to light from three of the countries to which Buddhism long ago spread out of Northern India; that is to say, from China, Japan, and Tibet. Filled as these countries are with Buddhist monasteries, and priests, and nominal adherents, and abounding in voluminous translations of the Sanskrit Buddhistic literature, little understood and well-nigh unintelligible (for neither country has had the independence and mental force to produce a literature of its own, or to add anything but a chapter of decay to the history of this religion), it has long been surmised that there must be Sanskrit originals in some form still preserved there. Prior, however, to the recent complete opening of Japan, nothing came, or could be expected to come, from any attempt at discovery in that country; and China had proved equally barren.

Now the aspect of affairs is quite changed; and Müller finds reason to make profuse acknowledgment of the good offices of certain young Japanese, Buddhist priests, who had come to England to study the ancient languages of India, the dialects of their own sacred books, and who have helped to procure him knowledge or copies of such material as is still accessible among the Buddhists of Japan. And, as it never rains but it pours, sundry Sanskrit texts from China were found already within reach, in England, in the hands of returned missionaries; and others, it may be added, are known to exist in this country. Such discoveries, until the present stage of study of the Buddhist literature, would have been of little account; now, they are comparatively timely; for it is a matter of some degree of interest to see how the originals preserved in the furthest East compare in text with the same documents as found nearer home. But that is all, or nearly all. That we should gain by their aid any deeper insight into the origin and early history of this system of belief is not in the very least to be expected. In fact, largely for personal reasons easy to understand, the value of these discoveries has been vastly overrated. First communicated by Prof. Müller to the Asiatic Society, with an emphasis heightened by his non-attendance for many years, the story was told again at the last autumn's International Oriental Congress in Berlin, and its author, supported by his Japanese neophytes, laid the present little work on the table as his contribution to the interest of the occasion. And once more, on the way home to England, the same *cortège* exhibited itself for a like purpose before the Institute of France.

Seldom has so much *renommée* been won at so small an expense. One cannot but contrast it with a case or two of another character. By exceptional acuteness and energy, Prof. Roth, of Tübingen, caused the bringing to light in Cashmere, some years ago, of the new text of the Atharva-Veda. It is the most important find made for a generation, in Hindu literature, of which the credit is due so exclusively to an individual, and all specialists know it as such; but the great public has never been asked to look on and applaud. Of kindred merit was Burnell's discovery of a new and voluminous text belonging to the second, or Brâhmana, period in the religious history of India; but of that, too, the knowledge is limited to those whom it really concerns, and who are capable of estimating it at its true value.

BOOKS OF THE WEEK.

Abbott's Young Christian. A Memorial Edition, with a Sketch of the Author by one of his Sons. New York: Harper & Brothers.
Auerbach, B. Spinoza: a Novel. New York: Henry Holt & Co. $1.
Baker, T. Ueber die Musik der Nordamerikanischen Wilden. Leipzig: Breitkopf & Härtel.
Baker, G. M. The Reading Club and Handy Speaker. Boston: Lee & Shepard. 50 cents.
Boker, G. H. The Book of the Dead. Philadelphia: J. B. Lippincott & Co.
Hughes, T. Tom Brown's School-Days. Harper's Franklin Square Library. 10 cents.
Madvig, J. N. M. Tulli Ciceronis De Finibus Bonorum et Malorum Libri Quinque. New York: Harper & Bros.
Metcalfe, F. Passio et Miracula Beati Olaui. Oxford: Clarendon Press; New York: Macmillan & Co.
Newton, W. W. The Voice of St. John; or, The Story of the First Easter Day. New York: A. D. F. Randolph & Co.
Paine, Harriet E. Bird-Songs of New England. Boston: A. Williams & Co.
Perry, W. C. Greek and Roman Sculpture. 268 illustrations on wood. New York: Scribner & Welford.
Pebody, C. English Journalism, and the Men who have Made it. New York: Cassell, Petter, Galpin & Co.
Pollard, Josephine. The Decorative Sisters. New York: A. D. F. Randolph & Co. $2.
Polly's Scheme. By Corydon. Boston: D. Lothrop & Co. $1.
Reiss, W., and Stübel, A. The Necropolis of Ancon in Peru. Part 5. New York: Dodd, Mead & Co. $7 50.
Scribner's Geographical Reader and Primer. New York: Chas. Scribner's Sons. 60 cents.
Seymour, T. D. Selected Odes of Pindar, with Notes. Boston: Ginn, Heath & Co.
Sime, J. Schiller. Philadelphia: J. B. Lippincott & Co. $1.
Shepherd, P. First Aid to the Injured. New York: G. P. Putnam's Sons. 50 cents.
Shorthouse, J. H. John Inglesant: a Romance. New York: Macmillan & Co. $1.
Spofford, A. R. The American Almanac for 1882. New York: American News Co.
Subdued Southern Nobility: a Southern Ideal. New York: Sharps Publishing Co.
Three Hundred Outlines of Sermons on the New Testament. New York: A. C. Armstrong & Co. $1 50.
Underwood, F. H. James Russell Lowell: a Biographical Sketch. Boston: J. R. Osgood & Co. $1 50.
Verhandlungen des Ersten Deutschen Geographentages zu Berlin am 7. und 8. Juni 1881. Berlin: Dietrich Reimer; New York: L. W. Schmidt.
Warington, R. The Chemistry of the Farm. New York: Orange Judd Co.
Weeden, W. B. The Social Law of Labor. Boston: Roberts Brothers. $1 50.
Wheatley and Delamotte. Hand-books of Practical Art: Art-work in Gold and Silver—Mediæval. Also, Art-work in Earthenware. New York: Scribner & Welford.
Wright, W. A. Life of King Henry the Fifth: Shakespeare Select Plays. Oxford: Clarendon Press; New York: Macmillan & Co.

DEALER IN NEW AND OLD BOOKS.

PRICED CATALOGUES, containing valuable standard literature, as well as rare, curious, and out-of-the-way books, are issued from time to time, and will be forwarded to any address.

BOOKS PURCHASED.

A General Index to the Nation

From July, 1865, to September, 1880.

Net price (no trade discount), $2 50. Purchasers will please remit with order. Address Publisher of the *Nation*, Box 794, New York, or Q. P. INDEX, Bangor, Maine.

WE SHALL PUBLISH APRIL 10, 1882:

A Series of

TEN GEOLOGICAL PLATES,

27½ x 36 inches, containing Fifteen Diagrams designed for use in Schools and Colleges. Edited by A. S. Packard, Jr., Professor of Geology and Zoölogy, Brown University, and Editor of 'The American Naturalist,' author of 'Zoölogy,' etc.

The diagrams are to be accompanied by a Text-Book, FIRST LESSONS IN GEOLOGY, 128 pages, 8vo, by Prof. Packard.

The series of diagrams are arranged in the form of landscapes, and contain a number of original restorations of American, Silurian, and Devonian animals, especially Carboniferous, Jurassic, and Tertiary Vertebrate animals, by Prof. E. D. Cope, H. F. Osborn, and the Editor; with restorations in the text.

Price for the ten diagrams and book, postage paid, $6. Address all orders to THE PROVIDENCE LITHOGRAPH CO., Providence, R. I.

Engravings and Etchings.

Old and Modern. Fine framing. FREDERICK KEPPEL, 23 East Sixteenth Street (Union Square). Correspondence invited. Visitors always welcome.

NEW ENGLISH BOOKS

At 25 Cents to the Shilling,

Sent, post-paid, direct from London, on receipt of price of publication in bankers' draft, currency, or post-office order.

The recent Custom-House and Post-Office Circulars permit all printed matter to be mailed to the United States with safety and economy, and the duty, if any, to be collected from addressees.

Stevens's Priced List of nearly 500 English, French, and German Periodicals, with fuller Announcement for supplying books by mail or freight, is distributed gratuitously by every public library in the United States, by Tice & Lynch, 34½ Pine Street, New York, and B. F. STEVENS, American Library and Literary Agent, 4 Trafalgar Square, Charing Cross, London, England.

The Nation.

NEW YORK, THURSDAY, APRIL 13, 1882.

The Week.

THE President possesses a discretion in making up his Cabinet on which no reformer proposes to place any formal restriction. Cabinet offices are, and must be under every system, political offices, for the manner of filling which he cannot be held accountable anywhere except at the polls. He may fairly, in making them, consider various things besides a man's administrative capacity, because the Cabinet is, in a certain sense, a representative body. But in making appointments to subordinate offices, he is bound to consider nothing but administrative efficiency. President Arthur has acknowledged this himself, both in his letter of acceptance as Vice-President, and in his message to Congress last year, which contained by implication complete condemnation of the use of the subordinate offices of the Government to reward party services. Whatever, therefore, may be said for the manner in which he has filled the Cabinet, it is difficult to see what can be said for the appointment which he has just made to the Boston Collectorship. There is no point of view from which it will bear examination. The President said in his message that the tenure of office should be "stable." Well, the late Collector, Mr. Beard, had given universal satisfaction to the business community, and had brought the Custom-house to a high degree of efficiency; so that there was no administrative reason whatever for his removal. Nor was there any political reason which even a good party man ought to be willing to avow. Mr. Beard is undoubtedly the choice of the great body of the Massachusetts Republicans, and was carrying out to some extent that system of reform to which they gave emphatic approval in their platform of last year, which defined the reform as consisting in "the relief and exclusion of members of the legislative branch from the business of selecting officeholders in the department of administration"; in the prohibition of assessments on officeholders for party purposes; in appointment through competitive examination and a short term of probation; and "tenure of office during good behavior or for a reasonable fixed term." The Convention called on their representatives to support measures designed to bring this reform about, and denounced the system now in use as "aristocratic," and as affording the "fewest restraints against abuse," and as tending to "extravagance and inefficiency in the public business," and to "selfishness, corruption, and violence in politics." The Republican press of Boston, too, with one exception, strongly approves of the retention of Mr. Beard, and strongly reprobates his removal.

This one exception is the *Traveller*, which has long been in a position of bitter antagonism to the bulk of the Republican party, and represents nothing but the small clique which followed General Butler's lead until he went over openly to the Democrats. Since then it has been rabidly "Stalwart," but has mainly displayed its Stalwartism in ridicule and abuse of civil-service reform, and has surpassed every politician now in public life in its advocacy of the spoils system. It not only does not believe in competitive examinations or tenure during good behavior, but does believe in appointment for party services, and tenure during any kind of behavior which does not diminish a man's usefulness as an electioneering agent. Moreover, no paper, except the Whiskey-Ring organs of the West, has descended to such coarse abuse of everybody who makes any profession of a desire to improve the character of the public service. Well, the editor of this paper, Mr. Worthington, is to be the new Collector, in Mr. Beard's place. As an expression of indifference to the opinions not only of the Massachusetts delegation in Congress, who have not a word to say for him, but of the best part and by far the larger part of the Republican party of the State, which has over and over repudiated both his opinions and his associates, nothing equal to this has occurred since General Grant appointed Mr. Simmons, Butler's henchman, to the same place. In that case, as in this, neither the wishes of the Boston merchants, nor of the local party leaders, nor of the Republican press, nor of the Senators or Representatives of the State, had any weight with the President. It would be interesting to know from some qualified source under what system such an appointment is made. It cannot be the "spoils" system, properly so called, for in that case the Senators or Representatives would control the appointment; it cannot be the reformers' system, for Mr. Worthington glories in his contempt for it, and will make haste to destroy any vestiges of it he may find in his office; it cannot be the business system, for he knows nothing about Custom-house duties. What system is it, then?

It is obvious to everybody who remembers the events of last spring, that the President by his nomination of Worthington for the Boston Collectorship has placed Senators Hoar and Dawes, of Massachusetts, in exactly the position in which Senators Conkling and Platt were placed by the Garfield Administration when they resigned their seats. The long letter to the Governor in which they justified their course contains hardly any argument which the Massachusetts Senators might not now use. That Mr. Arthur felt the force of those arguments, and thought the resignation justifiable, we infer from his coming on to Albany and lobbying for a month to procure the vindication of Messrs. Conkling and Platt by re-election. We are forced, therefore, to ask whether he has meant by his recent action to compel Messrs. Hoar and Dawes to resign, or to confess that he was mistaken in thinking Messrs. Conkling and Platt did right in resigning. In either case we trust Messrs. Hoar and Dawes will not resign; but they can hardly avoid open opposition, however meekly they may feel, because in selecting Worthington for the Collectorship the President has made that nomination, of all possible nominations in the State, which most distinctly indicates his disregard for the formally expressed views of the Massachusetts Republicans on the question of civil-service reform. It is as if the Mayor of Boston, by way of revealing his opinion of the license and screen laws, were to place a renowned and audacious liquor dealer and old toper at the head of the Police Commission.

The President's veto of the Anti-Chinese Bill has been sustained by a vote of the Senate. The Pacific Coast is in a blaze of indignant excitement, and the Democrats, with an eye to the vote of the Pacific States, declare with exultation that now the record of the Republicans and of the Democrats respectively on the Chinese question is complete. Senator Miller, from California, has reintroduced the vetoed bill, changing only the period during which Chinese immigration is to be suspended, from twenty to ten years. This change, while to some extent meeting the President's most prominent objection to the bill, is quite insufficient to cover the case. Not only should any law passed by Congress upon this subject be consistent with the provisions of our treaty with China in point of form, but its substance should be such as to render the maintenance of friendly relations with China possible. The people of the Pacific States have lashed themselves into an unreasoning fury about the Chinese question, which has made them entirely blind to their own manifest interests.

The Californian papers give expression in various ways to this indignation. One says the veto is "appalling"; another says it is "arbitrary"; another says it has caused great "dejection"; and another that it has given "a shock of painful character," so painful, indeed, that "it is difficult to find language to describe it." The Pacific Slope is not easily appalled, and never remains long dejected, and gets over even the most powerful shocks with much rapidity. Of course reflection is not easy for persons in deep affliction, but it will come by and by; and when the time for it has come, we advise the Californians to read the resolution which Mr. Miller, their Senator in Washington, and the promoter of the Anti-Chinese Bill, introduced and got unanimously passed by the Republican State Convention in 1869. This resolution ran as follows:

> "Resolved, That we recognize the power of the general Government to restrict or prevent Chinese immigration whenever the welfare of the nation demands such a measure by terminating our commercial relations with China. But it should be considered that the adoption of non-intercourse in respect to China surrenders to Europe the commerce of the Empire of China. We believe that the general prosperity will be greatly enhanced by fostering commercial intercourse with Asia, and that the closing of our ports at this time against Chinese immigration would be most injurious to the material interests of this coast, a reproach upon the intelligence of the American people, and contrary to the spirit of the age."

Of course Mr. Miller was no wiser or more trustworthy then than he is now, when he is full of

anti-Chinese fury and fuss, but the facts have stood by him as he was in 1869 remarkably, for the Chinese immigration has not increased in the same ratio as the white population, while the Chinese trade has increased in much greater ratio. Our imports from China in 1870 amounted to $8,520,000; in 1881 they amounted to $22,358,908. Our exports to China amounted in 1870 to $420,000; in 1881 they reached $4,661,957.

President Arthur has now completed his Cabinet. As it stands it may be considered the Cabinet of his choice, for it is generally believed that Mr. Lincoln will remain at the head of the War Department at the President's request. Mr. Kirkwood leaves the Interior Department with the reputation of an upright and faithful officer. His successor, Mr. Teller, is a man of ability and brings to the discharge of his duties such an equipment as the experience of the Senate, of an active law practice in land and mining cases, and of Western life gives. He takes charge of a department which is an unwieldy conglomeration of incongruous parts, some of which would separately be sufficient to put even more than ordinary executive ability to a severe test. The duties upon which Mr. Teller enters are of the most complicated and thankless kind, and in the judgment passed upon his performance of them he will be entitled to a candid consideration of the great difficulties which every man in that position has to contend with.

Mr. William E. Chandler, who has been nominated as Secretary of the Navy, is undoubtedly a man of capacity, who may soon succeed in mastering the duties of the department. But in some respects his appointment borders upon the grotesque. What end President Arthur expects to accomplish by it is a matter of speculation. Mr. Chandler has so far been known mainly as a shrewd and not overnice political manager. Although thoroughly in sympathy with and profoundly versed in "Machine" methods, he has been counted as a member of a faction opposed to that to which the President belonged. If the President intended to make a concession to the "Garfield Republicans," for the purpose of "uniting the party," it will be thought that he might have selected a representative carrying more weight with the great mass of them. Mr. Chandler has been considered one of the principal lieutenants of Mr. Blaine in his political operations. If he continues to be such, he may form a connecting link between the Administration and that candidate for the Presidency, but he would be a very uncomfortable link for the President to have in his political family, supposing Mr. Arthur to cherish any aspirations himself. But if, as is rumored, Mr. Chandler has severed that intimate connection with Mr. Blaine, he will be regarded with distrust in that quarter, and it is difficult to see with whom he is to connect at all. We apprehend that the President, in attempting an exceptionally shrewd thing in the way of political management, has made an investment that will not pay. When in addition to all this it is remembered that Mr. Chandler was rejected by the Senate when nominated for the office of Solicitor-General about a year ago, and that the same Senate will now have to pass upon his nomination for a higher position, the case appears in a still more curious light.

The bill passed last week by the Senate for counting the electoral vote, originally drawn by Mr. Edmunds, probably guards as efficiently as any Congressional legislation can against a recurrence of such troubles as arose out of the electoral contest of 1876. It provides, in the first place, that the electors of each State shall meet and give their votes on the second Monday in January next following their appointment. The law at present requires them to meet on the first Wednesday in December, a date which gives only an interval of a month from the November election for the settlement of all disputes in each State, as to the persons entitled to certificates of election. In 1877, this interval was found to be altogether too small. The Senate bill now doubles it, and, having done this, proceeds to provide, or at any rate to suggest a way of providing, for the summary settlement of all disputes in any State by the State itself. The bill enacts that each State may, pursuant to its laws existing on the day fixed for the appointment of electors (this of course excludes retroactive measures passed after the popular election), determine, in the interval between their appointment and the meeting of the electors in January, any controversy concerning the appointment of any of them; and that the determination shall be conclusive evidence of their title, and shall bind the two Houses of Congress in counting the vote. It will be seen that the whole object of this bill is to throw upon the States themselves the responsibility of deciding all disputed questions as to their respective electoral votes, and to limit the work of Congress to the function devolved upon the two Houses by the Constitution—that of counting the votes sent in.

In an interview reported by the *Evening Post* on Friday, Postmaster Pearson commented with praiseworthy freedom on the recent letter of First Assistant Postmaster-General Hatton. Mr. Hatton said that President Grant's order forbidding postal clerks to hold municipal offices, and President Hayes's order forbidding Federal officers to take part in political work, did not "include employees of post-offices." What he meant was rather that under the present Administration these orders would not be applied to such persons, for the orders themselves are sufficiently explicit. The first one relates to postal employees in terms, and the second makes no exception in their favor. Mr. Hatton does, indeed, add, "unless the [municipal] employment interferes with the efficient discharge of their duties in the post-office." He decides that "under this limitation" a postal clerk may "accept the office of Alderman." The original order, however, makes no such qualification. It was not intended merely to prohibit neglect of Federal duty for other work in particular cases, but to lay down a general rule for the correction and prevention of a tendency to neglect, which is inevitable if such double employment is tolerated. There is also a political reason for the order. The inexpediency of blending diverse and perhaps conflicting public trusts in this way is recognized by the Constitution of this State, which provides (Article III.) that no member of the Legislature shall receive any civil appointment from the Governor or the Legislature during the time for which he shall have been elected, and that no person who, at the time of election, or within a hundred days of it, holds a civil or military office under the United States or any city government, shall be eligible to the Legislature. The State thus embodies a sound principle in its organic law, and the United States should at least respect it in practice.

As to participation in politics, Mr. Hatton holds that it is not only the privilege but the duty of a postal clerk or other Federal officer to exercise his "rights as a citizen" by promoting "the success of all public and political measures" which he regards as "beneficial to his country"—that is, to help the "grand old party" to "win victories." Does this mean that a Democratic clerk will be allowed to promote "political measures" which he believes to be beneficial, or that only Republican officers will be permitted to help their "grand old party"? Postmaster Pearson points out the "radical change in the civil-service regulations" which his superior officer's letter implies, and says that the duties of municipal or State and Federal offices simultaneously occupied "will naturally clash"; and while he cannot in the circumstances forbid the double employment, he will deal as the interests of the service require with any man who neglects his duties for any reason whatever. This may have the effect of practically prohibiting in this city what the Washington department in terms allows.

The scenes attending the burial of the late Jesse James on Thursday, at Kearney, Missouri, were very affecting. Crowds of people flocked together from all parts of the State to get a last sight of the dead bandit, who had, while alive, done so much to enable them to lead what they call in Boston "full" lives. Mrs. Samuels, Jesse's mother, was on the ground early, and talked without reserve to everybody. Her conversation naturally, under the circumstances, was colored with deep religious feeling, and she said to a reporter, who in his shy way ventured to express his sympathy with her in her bereavement, "I knew it had to come; but my dear boy Jesse is better off in heaven to-day than he would be here with us"—a sentiment from which no one will be likely to dissent. The officiating clergyman with much tact avoided dwelling on the life and character of the deceased, and improved the occasion by enlarging upon Jesse's chances of future improvement in Paradise, in a manner that would probably have struck Mr. James himself as rather mawkish. The wide-spread belief in the West that he has gone straight to heaven is a touching indication of the general softening of religious doctrines.

Dr. G. Halsted Boyland, of Baltimore, has contributed a letter to the Lamson case in which he mentions the following facts as tend-

ing to show that Dr. Lamson is not criminally responsible: first, that once, about twelve years ago, he went off into a "state of semi-syncope," and was at that time of "an anæmic temperament generally"; second, that on another occasion he displayed a violent and unreasonable temper; and third, that he prepared an anonymous letter containing groundless complaints about a surgical amphitheatre. He adds in a postcript, "I remember well his passion for experimenting with different chemicals." He modestly forwards this "on oath, in the interest of justice, for what it may be worth." Now, supposing that twelve years hence Dr. Boyland himself should commit a crime, could not this letter be used in the interest of justice, for what it is worth, to show that in 1882 he had begun to develop symptoms of mental weakness, and mental weakness, too, on the very subject of responsibility for crime? What is a better test of irresponsibility than symptoms of confusion in the patient's mind as to responsibility? Dr. Boyland probably does not himself intend to poison any one in 1895, but we throw out the hint to all physicians contemplating a career of crime as among the possibilities of the future—for what it is worth.

Bishop Elder, who presided at the late Catholic Provincial Council at Cincinnati, has written a long letter to the Cincinnati *Commercial*, explaining the pastoral letter issued by the Council, whose doctrines touching the sources of political power and the equality of men had alarmed that paper, as well as a great many others. The Bishops had denied that political power came from the people, or that men were equal either in mind or body—which led some editors to tremble for popular government, and for equality before the law, and for the authority of the Declaration of Independence. Bishop Elder now says that the inequality of men is a fact which stares us in the face; that everywhere around us we see differences in physical and mental power and in social advantages, and everywhere we see the many ruled by the few. There can be no harm, therefore, he argues, in describing what exists and has always existed, and this was all the Council did in the matter of equality. As to the source of power, he cites the Scriptural proposition that "the powers that be are ordained of God," in support of the doctrine of the Council that power does not come from the people, and points to the difference between the duties of officers and those of the people, in support of the proposition that rulers have rights which the ruled have not. All this is really very harmless word play. Power always and everywhere originates with those who have it. If the priests have it, it originates with the priests; if the aristocracy, with the aristocracy; if the people, with the people. Nobody ever held power which he had got in the wrong place. We shall be in danger from the pastoral letters of Catholic theologians whenever they seem likely to persuade the people to give up the elective system; but until this comes to pass, an opinion that power comes from some place else than the popular vote, is as harmless as an opinion that it comes out of a hole in the ground.

During the week the Treasury called for redemption $15,000,000 more United States 3½ per cent. bonds, which makes $90,000,000 called since last November. This gives some idea of the amount of the surplus revenues of the Government, and shows also how rapidly investment-money is being driven from United States bonds into other securities. No gold was exported during the week, although foreign exchange ruled most of the time near to the point at which gold must leave the country. The disbursements of the Treasury for interest and called bonds were heavy, and the domestic exchanges were generally in favor of this city. The method, however, of the banks in making a statement of average condition for six days, instead of actual condition at the close of the week, accounts for an apparent decrease in their surplus reserve. The money market was throughout very easy for borrowers, and at declining rates. At the Stock Exchange the course of prices for speculative stocks was downward, although varied with "sharp rallies" from time to time. United States 4 and 4½ per cent. bonds advanced to the highest prices ever paid for them—119¾ and 115⅞ respectively. All the foreign money markets continue very easy. Silver bullion advanced in London to 52½d. per ounce, and the bullion value here of the 412½-grain silver dollar to $0.8855.

The Imperial Government of Austria has done a thing which if it had been done at the right moment by Prince Bismarck, would have saved Germany much shame, and if it had been done by the Czar a year ago, would have spared Russia great material loss and deep disgrace in the eyes of the civilized world. There is just as much and just as little reason for anti-Semitic movements in Austria as there is in Germany or Russia. But the Imperial Prime Minister, Count Taaffe, has nipped them in the bud by issuing stringent orders forbidding all anti-Jewish demonstrations, and declaring the duty and the resolution of the Government to protect the rights of every subject, regardless of politics or religion. In Germany the Jew-baiting movement has been suppressed by public opinion. The last elections showed that the disreputable disturbance had been caused by a very small minority of the people, who stopped their noise as soon as their feebleness was exposed. In Russia it will continue as long as the Government maintains an attitude leaving it uncertain on which side its sympathies are. In Austria and Germany people are sincerely ashamed of it, but in Russia they are not.

Prince Gortchakoff has finally retired from office—we believe for the third time. His advanced age and long term of service have kept him on the point of retiring ever since he repudiated in 1870 the restrictions put on Russia in the Black Sea by the Treaty of Paris. This marked the close of that process of self-examination, not sulking, to which Russia, he said, in a famous *mot*, subjected herself after the Crimean war. It marked, too, her reappearance on the stage of European politics, and her readiness for any venture which might offer itself. For this rehabilitation the Empire was indebted to nobody so much as to the old diplomatist who is now disappearing, for this must be his last final departure. He belonged to the Metternich school of diplomacy, which plumed itself on its finesse, its reticences, its evasions, and its skill in the use of social influences, and has, since the Emperor Nicholas's death and the rise of Bismarck, had to play a game which was a little too novel for an old man. Bismarck's brutal frankness and truthfulness have in fact worked a change in the methods of the art to which nobody who had learnt it in the old days before 1859 could find it easy to adapt himself; and the Prussian was undoubtedly too much for Gortchakoff in the long game which preceded Sadowa. The conditions of official life in Russia, too, since Nicholas's death have considerably changed. The good old times, which De Maistre describes, in which envoys and generals had nobody to account to but the sovereign, and no place in which they needed to stand well but the Court, have come to an end in Russia as well as elsewhere. The great advantage which the Continental diplomatists used to enjoy over the English in having no public behind them, has been lost even by the Russian Foreign Office. Gortchakoff's "august master"—the Russians are now the only diplomatists who make free use of the phrase—is really not his master any longer. There is behind the throne a power greater than the throne, and which the throne is vainly trying to shake off, but whose will is still somewhat inscrutable, and which a man of Gortchakoff's training could never have effectively served. The world he leaves is in fact a new world, made by steam, electricity, and, though last not least, by dynamite and other explosives.

There can be but little question that the exhibition recently made of his treasury by the Sultan to General Wallace and Mr. Phelps was the result of his recent investigation of American matters through the former of these gentlemen. He doubtless heard of the exhibition of his securities made by Jay Gould, and thinks Gould is a great pasha, of unusual skill in "squeezing" the taxpayers, and in all sorts of ways getting money out of people against their will, which is now the art which the Sultan estimates most highly. As he has several times within the last year come near being out of mutton for the palace, owing to inability to pay a long-standing butcher's bill, and as he can borrow no more from the "Galata bankers," he probably thinks, from Jay Gould's example, that by merely "showing his securities" he can revive his credit. This will hardly do in his case, however, because he has no stock market to work on. Our advice to him is to get Gould to Constantinople, and put him at the head of the Ministry of Finance. We promise him that he will in three months open his eyes as to the resources of his unfortunate empire. Even Osman Pasha, the old ruffian who secures payment of his salary by knocking down the Treasury messengers and rifling their bags, thinks the Turks are a used-up people, but Gould would soon show him his mistake.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

THE President sent to the Senate on Wednesday a report of the Secretary of State relating to the American citizens imprisoned in Ireland, from which it appears that all but three of the prisoners have been set at liberty in response to the request of Mr. Lowell. Mr. Frelinghuysen further states that the negotiations have been carried on for some time "in a spirit of entire friendship." The London *Times* says the Government hold all persons resident in Ireland liable to British law, and to be treated as British subjects, and that the naturalized subjects of the United States who have been released, were released for reasons entirely unconnected with their citizenship.

The President sent a large batch of nominations to the Senate on Thursday, among which were those of Senator Henry M. Teller, of Colorado, to be Secretary of the Interior, William E. Chandler, of New Hampshire, to be Secretary of the Navy, William H. Hunt, the Secretary of the Navy, to be Minister to Russia, and Roland Worthington, to be Collector of Customs at Boston. The last nomination has been received with a general feeling of disapproval throughout the country.

The Senate took up the Chinese Bill on Wednesday, and, on a motion to pass it over the veto, sustained the veto by a vote of 27 yeas to 21 nays.

The bill to fix the day for the meeting of the electors of the President and Vice-President, and to provide for and regulate the counting of votes for those officers, and for the decision of questions arising therefrom, was passed by a *viva-voce* vote by the Senate on Thursday.

The Senate has passed a bill which opens the entire reservation recently occupied by the White River and Uncompahgre Utes to settlement. This tract of land, amounting to nearly 10,000,000 acres, is declared by the bill to be public land, subject to disposal in accordance with the regulations of the Ute Bill of the last Congress.

Senator Dawes introduced a bill into the Senate on Thursday, appropriating $50,000 to provide for a deficiency in the subsistence of the Cheyenne and Arrapahoe Indians. He submitted a telegram from General Pope, showing the necessity for an immediate appropriation to save these Indians from starvation, and explained that the exhaustion of the regular appropriation had been caused by a rise in the price of beef, the principal element in Indian subsistence, and that an outbreak was threatened if the deficiency was not provided for. The Senate promptly passed the bill, but the House (by way of rebuke for encroachment on its prerogative) threw it out, and at once passed a bill of its own of the same tenor.

A resolution was passed by the Senate on Tuesday authorizing Lieutenant-Commander Sigsbee, United States Navy, to accept a decoration from the Emperor of Germany, and Senator Hawley to accept decorations tendered to him, as President of the Centennial Commission, by the Governments of the Netherlands, Spain, and Japan.

The House passed the Army Appropriation Bill on Wednesday, and the Committee on Elections adopted, by a vote of 7 to 2, a resolution declaring that E. W. Mackey was duly elected and entitled to a seat as Representative from the contested Eleventh district of South Carolina.

The debate on the bill to create a tariff commission continues in the House. The subject has been almost exhausted by the speeches which have already been made upon it, but there are over a hundred more members who have given their names to the Speaker as wishing to speak for or against the bill.

The House Committee on Education and Labor has directed Representative Sherwin, of Alabama, to draft a bill to be submitted to the Committee, recommending that an appropriation of $10,000,000 be made to be expended throughout the United States for educational purposes in accordance with the ratio of illiteracy.

The accounting officers of the Treasury, who were constituted a committee on the question of Government supplies, have made a report to Secretary Folger. They recommend that the existing laws be so amended as to do away with all advertising for proposals in the case of necessary articles of small value, and in the case of articles in which there cannot possibly be any competition. It is probable that Secretary Folger will bring the matter to the attention of Congress.

The limited appropriation remaining at the disposal of the Bureau of Steam Engineering, and the expense of fitting out certain ships at the navy-yards at New York, Boston, and Mare Island, California, have made it necessary to suspend work at all the other navy-yards until the next appropriation becomes available. Many artisans and laborers have thus been thrown out of employment.

The Hydrographic Office at Washington has just perfected a new circumpolar chart showing the course of the *Jeannette*, the location of the islands discovered by Commander De Long, the boundaries of Wrangel Island, as recently determined by the United States ship *Rodgers*, and other valuable data, embraced, for the first time, in a chart of the Polar regions.

The report of the Naval Board that examined the *Jeannette* at San Francisco before she sailed in 1879 has just been made public. The report says, among other things, that it was not possible to make the *Jeannette* "particularly adapted" for the service for which she was intended. It is regarded as singular that Commander De Long should have been willing to start in the *Jeannette* in the face of this report, as he had authority to buy a vessel that would be fit.

Secretary Hunt has received a despatch from Engineer Melville, dated Yakutsk, January 27, in which he says that he has completed all necessary arrangements for supplies and outfits for six months, and will "leave this place for Bulun to-day, thence to the Lena delta to continue the search for missing comrades. The provision train is four days in advance of me, and, unless some unforeseen circumstance arises, I shall be at the Lena delta before March 1. No mails pass between Bulun and Yakutsk between March 8 and October; therefore no anxiety need be felt for the safety of myself and party for that time."

Reports received by the Agricultural Department at Washington show a hopeful prospect for good crops in the South. There is a general increase in the acreage of spring wheat and oats, and a slight decrease in that of cotton.

The Secretary of War has not yet given out his report in the case of Sergeant Mason. It is said, however, that he has recommended a mitigation of the sentence to four or five months' confinement in the regular guard-house, to forfeit all pay due or which may become due to him, and to be dishonorably dismissed from the service.

Mrs. Scoville has filed a petition in the County Court at Chicago, praying that a conservator be appointed for the person and estate of Charles J. Guiteau. She alleges that he is possessed of copyrights, manuscripts, etc., valued at several thousand dollars, and has a large income from the sale of photographs and autographs, and that by reason of his insanity he is incompetent to take charge of this property. She alleges also that he is negotiating a sale of his body to be preserved after death.

In the Criminal Court at Washington on Monday Judge Wylie rendered his decision on the motion to quash the indictments in the Star-route conspiracy cases. He decided that the indictments were good and sufficient and must stand. It is believed that the cases will be brought to trial in May. The prosecution are confident that the same great array of evidence that secured the indictments will secure conviction, and the defence is said to be growing despondent. S. W. Dorsey having left Washington for New Mexico, his recognizance was declared forfeited and a bench-warrant issued for his arrest. Mr. Ker, of Philadelphia, who drew up the indictments, said on Monday night that if Dorsey did not surrender himself no effort would be spared to find him, and, in conclusion, said, "We have relied on Colonel Ingersoll's honor, and he has promised to produce his clients in court."

After Judge Wylie's decision in the Star-route cases, on Monday, Colonel Totten, counsel for the defendants, stated that in the cases of Brady and Turner he had certain pleas of abatement to file, to the effect that, pending the time the Grand Jury were finding the indictment, certain persons other than the District Attorney and his assistants had free access to the Grand Jury room, and laid before them pamphlets and other ex-parte evidence; but the court decided not to go into the matter.

Mr. George M. Chilcott, of Pueblo, has been appointed United States Senator from Colorado, to succeed Mr. Teller, recently appointed Secretary of the Interior.

The Senate and House Executive Committees of the Democratic Congressional Campaign Committee met in Washington, on Monday, and elected General Rosecrans permanent chairman of the Joint Committee.

The Republicans carried Rhode Island on Wednesday by 4,583 majority and elected a Legislature that will return Mr. Anthony to the Senate.

A correspondence between Wharton Barker, a prominent Independent Republican of Pennsylvania, and Mr. Mitchell, Senator from that State, has been published. Mr. Barker thinks that the Republican party will no longer be able to control Pennsylvania unless something be done to emancipate it from the control of the "Machine" headed by Senator Cameron, and writes to ask Senator Mitchell to take some steps in the matter. The latter suggests a conference of regulars and independents.

The Readjuster measure for redistricting Virginia for members of Congress, so as to give that party eight out of the ten members of Congress to which the State is entitled, passed the House of Delegates on Saturday.

Governor Cameron, of Virginia, has commuted the sentence of the oyster dredgers, who were recently convicted of violating the oyster laws of the State, and sentenced to one year each in the Penitentiary. The captains are to be confined for sixty days in the County Jail, and all the seamen, except one, are pardoned.

The Oregon Democratic Convention have adopted resolutions demanding the legislative regulation of railroads and the reform of the tariff. The resolution on the Chinese question states that the President's veto of the Chinese Bill is a public misfortune, and that it treats with "contemptuous derision" the protests and appeals of the entire Pacific Coast. In behalf of the people of Oregon the veto is disapproved and condemned.

The Mormon spring conference at Salt Lake City adjourned on Sunday. The Mormons purpose hereafter not to trade with Gentiles. A secret meeting of business men was held on Saturday, and stringent pledges to that effect were signed.

The striking operatives of Fall River as represented in the Spinners' Union have published a temperate and sensible address, in which they deplore the wide separation of capital and labor in the United States, and assert that only "foolish obstinacy and foolish pride" keep them apart. There is no material change in the condition of things at Lawrence; but very few of the strikers have returned to work.

M. de Struve, the new Russian Minister at Washington, was formally presented to the President, on Tuesday, by the Secretary of State.

The boiler of the steamer *Bella Mac* exploded near Brownsville, a few miles below Milwaukee, on Friday, killing six men and injuring many others.

Jumbo, the elephant, arrived in New York by the steamer *Assyrian Monarch* on Sunday. He behaved well on the journey, and seems to be none the worse for it.

FOREIGN.

A Russian imperial ukase has been published, stating that in deference to the wish of Prince Gortchakoff, the Czar has relieved him of the functions of Minister of Foreign Affairs, on account of his shattered health and advancing years. The Prince still retains the dignity of Imperial Chancellor and member of the Council of the Empire. By a second ukase, M. de Giers, who has been Assistant Minister of Foreign Affairs for the last five years, was promoted to succeed Prince Gortchakoff. This appointment is looked upon in Berlin as an "eminently pacific symptom," and it is thought that it will do more to restore confidence regarding the intentions and policy of Russia than all the friendly assurances that have been hitherto received from St. Petersburg. In Constantinople, also, the appointment has given great satisfaction.

Because of the activity of the Nihilists of Moscow, the question of holding the coronation of the Czar elsewhere is being seriously discussed.

A despatch from Vienna to the London *Daily News* said that the Russian authorities took great precautions against a renewal of the anti-Jewish disturbances at Easter. Over 2,000 persons with unsatisfactory papers were expelled from Kieff. A despatch to London on Friday said that grave apprehensions have been felt in Warsaw of a renewal of the outbreak against the Jews. Placards were posted threatening them, and causing great terror among the Jewish population. The Government ordered the shops to be closed, and took military precautions against an outbreak. Easter passed off in comparative quiet, however, and no serious disturbances have as yet occurred. Jewish immigrants from Russia and Poland continue to arrive in the United States in considerable numbers.

Count Taaffe, President of the Austrian Council and Minister of the Interior, has issued positive orders forbidding all meetings avowedly for the purpose of anti-Semitic demonstrations, and maintaining the duty of the Government to protect the rights of every subject regardless of politics or religion.

A meeting of the Mansion House Committee, on behalf of the suffering Jews of Russia, was held in London on Thursday. A telegram from Mr. Laurence Oliphant, one of the honorary commissioners of the fund on the Continent, was read, which stated that 1,221 refugees had already registered at Brody, in Galicia. The committee's fund was reported to have reached £66,000.

The condition of Ireland continues serious. The Coercion Act seems to be an admitted failure, and the Radicals are asking for the removal of Mr. Forster, the Chief Secretary for Ireland. Outrages of the most brutal kind continue. Mr. Smythe, a Westmeath landlord, who, while returning from church a week ago last Sunday with some ladies, was fired at, but who escaped while one of the ladies was killed, has written a violent letter to Mr. Gladstone, in which he "lays the guilt" of his sister-in-law's murder at his door, and says that "the terrorism existing under the protection of your police is so tremendous that I know there are but few who would venture to denounce the assassins had they seen them. Were they to do so their lives would certainly be forfeited, while the prisoners would almost as surely escape after the farce of a trial by jury." Mayor Traill, a resident magistrate of County Mayo, draws an interesting picture of the state of the county in a letter. He says he has often been threatened, and has been warned that his assassination was not only planned but actually paid for. He never travels without the escort of two armed policemen and an armed groom, and his escort search all the plantations, hedges, etc., on the route; and the neighborhood of his house is patrolled all night by an armed guard, who are provided with dogs to aid in the search for explosives and assassins.

Mr. Parnell was released for a week on parole on Monday, in order that he might visit a sister in Paris whose child had died. It was not generally known that he had only been released on parole, so the event was celebrated with great enthusiasm in parts of Ireland.

In conversing with a friend on his way to Paris, Mr. Parnell said he had little to complain of in regard to his treatment in prison. He and his imprisoned followers regarded the recent outrages with the greatest indignation, and he expressed the belief that the state of things in Ireland would improve if the Government introduced a bill to relieve the poor tenants of arrears of rent, and amended the clauses of the Land Act regarding purchase, so as practically to assist tenants to become owners of their farms—a result which he thought would go a long way to restore peace and order.

The "no-rent" disturbances seem to have reached Scotland. Lord McDonald having sent summonses to twenty of the tenants on his estate of Skye, for non-payment of rent, the process-server was seized by a mob and warned not to return, and the summonses were burnt. The no-rent agitation is said to be rapidly spreading on the island.

It is said that MacLean, who attempted to assassinate the Queen at Windsor, will be tried at Reading "with unusual pomp."

A meeting was held at the Mansion House in London, the Lord Mayor presiding, on Wednesday, with a view to taking steps to raise a fund for assisting unemployed working people to emigrate to Canada. Sir Alexander T. Galt, the Canadian High Commissioner, announced that Canada offered to give £1 a head for certain families to which the Canadian Pacific Railway Company offered employment. It was announced that £6,000 would be required to start the scheme.

The first of a series of large parties of colonists for Manitoba arrived in Halifax on Saturday. The party consisted of upward of 500 persons, and carried with them sums of money aggregating £500,000.

The Easter Volunteer Review came off at Portsmouth, England, on Monday. The Prince of Wales, the Duke of Cambridge, and Sir Garnet Wolseley witnessed it.

The returns issued by the Board of Trade show that during the month of March British imports increased, as compared with the same month last year, by £1,200,000, and that British exports increased £1,900,000.

Dean Bradley has issued a statement concerning the memorial window to Dean Stanley, subscribed to by Americans. He says that the list of subscribers thoroughly bears out the statement of the Rev. Phillips Brooks as to its widely representative character, and cites the names of our elder poets, including the late Mr. Longfellow.

Dante Gabriel Rossetti, the well-known English poet and painter, died on Tuesday, at the age of fifty-four.

Señor Sagasta, President of the Spanish Council, in replying to a deputation of Catalonian merchants, reiterated his refusal to make any modification of the commercial treaty with France. The Ministry count on 250 votes in the Chamber of Deputies in favor of the treaty. A meeting organized by Catalonian workmen was held in Madrid on Friday, at which free trade was denounced. It was declared that the treaty between France and Spain would be ruinous to Spanish industry, which the Government ought to foster by imposing high duties on foreign products. An anonymous proclamation has been circulated encouraging the workmen of Barcelona to persevere in their attitude of opposition to the Franco-Spanish treaty. Confidence has, however, been restored in a great measure in the disturbed districts, and on Tuesday most of the shops and manufactories at Barcelona which were closed on account of the recent disturbances, were reopened.

A syndicate of merchants has addressed a petition to the Spanish Cortes, praying that the Treaty of Commerce with France be ratified only after an inquiry has been made by a committee into the industrial condition of the country. The improved state of affairs in Catalonia is said to be due to a report that the Government will consent to an amendment to the treaty providing that it may be terminated at the discretion of either Government.

A despatch from Vienna says that the "bitterly cold weather and frosts now prevailing will, it is feared, greatly injure the crops. Fruit trees, vines, and young wheat in Rumania are almost entirely destroyed."

An official despatch published at Vienna states that the Austrian troops have completed the operations intended to clear the northern part of Crivoscie of insurgents. The Austrians advanced until they sighted the Montenegrin cordon, and saluted the Montenegrin troops.

The Porte, replying to the complaints of Bulgaria of the movement of Turkish troops near the frontier, stated that Bulgaria was aware of the efforts which are being made to produce a revolutionary movement, and should not be surprised at the Porte's endeavor to guard against them.

The Sultan of Turkey on Wednesday granted to General Wallace and Mr. Phelps, Ministers to Turkey and Austria respectively, the permission, now rarely given, to inspect the imperial treasury.

A semi-official newspaper in Constantinople says that the Porte has received a despatch announcing the movement of French troops toward the Tripolitan frontier, which inspires doubts of the value of the pacific declarations of France. The Porte proposes to raise the effective force of Turkish troops in Tripoli to 30,000.

News from Algiers announces that the French column has overtaken Bou Amena's forces south of Fighig, and completely defeated them, capturing his provision train and twenty-six of his women. Almost all of the fighting men were killed or captured. Bou Amena himself escaped. Nearly all of the insurgents in the south of Tunis have taken refuge in Tripolitan territory. A despatch received from Tunis on Tuesday stated that the Wergama tribe, inhabiting the Tripolitan frontier, have petitioned to be allowed to lay down their arms, and it is believed that this will hasten the time when the various other tribes will submit.

The French Government will despatch eight different expeditions to take observations on the transit of Venus on December 6, four of which will be stationed in the southern, and four in the northern hemisphere.

M. Paul Bert, ex-Minister of Worship, has been elected a member of the French Academy of Sciences.

Prince Bismarck, in reply to congratulations on his birthday extended by M. de Saburoff, the Russian Ambassador, wrote as follows: "It makes me happy to be able to inaugurate a new year of life by an expression of sentiments, personal and political, which facilitate the work in which we are both engaged."

A despatch from Cairo says that a plot has been discovered to assassinate Arabi Bey, Minister of War, and that many Circassian officers have been arrested in consequence.

TUESDAY, April 11, 1882.

BRIGANDAGE AND PIETY.

THE extraordinary doings in Missouri concerning the death and burial of Jesse James, the noted robber and murderer, have attracted a great deal of attention from the press, though hardly as much as they merit. James was a successful brigand of the worst kind for nearly twenty years. He served as a guerilla in the war, and when peace was concluded became a common bandit of the Greek or Italian type, but without holding his victims to ransom, there being no proper facilities in this country for transporting captives. His operations, however, were extended over an area, and conducted with a boldness, which make the most famous of the Greeks or Italians seem a petty knave. He robbed all along the Mississippi, from Minnesota down nearly to Louisiana, and some of his greatest exploits were performed in broad daylight, and not on lonely roads, but in the streets of small towns, and in business hours, and were frequently accompanied by murder. In fact, when we consider the extent of country over which his jurisdiction extended, the character of his crimes, the long period during which he enjoyed impunity, and the smallness of the force with which his blows were struck, we must admit him to be the greatest robber of either ancient or modern times, surpassing in many respects both the condottieri and the buccaneers.

The manner of his death, too, has something unprecedented about it. All the great robbers of old times, and of other countries, lived in caves, or in mountain fastnesses, to which it was difficult for troops to pursue them, or in strong castles, or kept the sea in long, low, rakish black schooners. James, however, lived in a comfortable house, surrounded by a loving family, and went off on his expeditions apparently as a business man goes off to collect debts or to solicit orders. Moreover, although the State of Missouri had for long years been trying to arrest him, it was never able to do so, and in order to compass his death the Governor had to resort to the means by which the Venetian Council of Ten and other mediæval powers occasionally tried to get rid of obnoxious foreign sovereigns. He hired an assassin to go and kill him unawares, so that James really died what may be called a royal death. He fell as Henry IV., and William the Silent, and Admiral Coligny fell, the victim of the hostility of a great community who were unable to get the better of him in open fight, but felt that his taking off was necessary to their safety and prosperity. The Governor in fact justifies his own course in language which might have been used by Elizabeth after the defeat of the Armada. He describes the assassination of James as the relief of the State from a great hindrance to its prosperity, and as likely to give an important stimulus to real-estate speculation, to railroad enterprise, and to foreign immigration.

"If you want to know the value of the deed," he said, "ask the managers of banks; ask the owners of land in that part of the State; ask the managers of the many railroads constructed in this State; ask the ticket agents at St. Louis, Kansas City, Omaha, and Chicago; ask the hotel keepers at St. Louis and Kansas City; ask the property-holders and real-estate agents at Kansas City and in Jackson County; ask those who own land in Clay and Platte; hear all their responses, and then say it was not a good deed in behalf of law, order, and general prosperity."

James's relations to the church, too, had a curiously mediæval flavor about them. He was the son of a Baptist minister, but his career apparently did not strike his mother, or any of his family or neighbors, as inconsistent with the possession of a stock of fundamental and ineradicable piety. When he died, she rejoiced in the thought that he had gone to heaven. Two Baptist ministers performed the funeral services, and a vast concourse of friends, including the sheriff, who was deeply affected, followed the remains to the grave, not sorrowing, apparently, as those who are without hope. In fact, the James territory, which includes the adjacent corners of four States, is a region which seems closely to resemble in its religious and moral condition a Frankish kingdom in Gaul in the sixth century. Every one knows how very early in the history of the Church the tendency to make faith take the place of right living began to show itself. St. James had to warn the very first generation of Christians that pure religion and undefiled consisted not in sound belief, but in good deeds. The difficulty of making people show their faith by their works has beset Christianity ever since. Barbarians rapidly accepted the Christian dogmas, and took eagerly to the rites and ceremonies of the Church, but they never were quite ready to accept its views about behavior. Gregory of Tours, in his most instructive chronicle, tells some very grotesque stories of the difficulties which the bishops had in Gaul in his day in refusing the communion to notorious evil livers. One Frankish chief—a great robber and cutthroat—insisted on having it administered to him, and the bishop had to let him have it, in order to save life, for he threatened to kill all the other communicants if he was not allowed to partake also. The comfort the Italian and Greek brigands find in the external observances of their creed, while committing the most atrocious crimes, is now an old story. A sceptical or agnostic robber is in fact unknown in eastern or southern Europe.

The devout brigands all belong to the Catholic or Greek Church, which has always greatly exalted the value of external worship and pious credulity, and thus furnishes only too much temptation to those who are ready to believe without limitation for the purpose of postponing any change in their habits. The Protestant Church has been much more exacting in the matter of conduct, and in fact has afforded in its teaching but few of the refuges for easy-going sinners which its great rival provides so plentifully. But the fight between faith and right-living nevertheless rages within its borders unceasingly, and not always to the advantage of the latter. It is not only in the James district in Missouri that one comes on the strange compromises by which a certain external devoutness is made to atone to the conscience not only for spiritual coldness, but for long and persistent violations of the fundamental rules of morality. Startling as are these revelations about the state of society in that part of the country, they are hardly more startling, everything considered, than the frequency with which our defaulters and embezzlers in this part of the world prove to have been vestrymen, deacons, Sunday-school superintendents, and prominent church members during long years of delinquency and perfidy. There is nothing new about it at all. It is, in fact, as we have said, simply another phase of one of the oldest struggles in the moral world. But the James story derives much freshness from the fact that he is probably the first Protestant who managed to keep his standing good in the local church and retain the affection of his pastor, and maintain a happy home, while openly pursuing robbery and murder as a profession.

THE "DUNGEON" CORRESPONDENCE.

THE official correspondence in the Irish "dungeon" cases has been communicated to Congress by Mr. Frelinghuysen. The correspondence begins in the Blaine period, and the first letter is an excellent specimen of the turgid, lurid, but somewhat obscure rhetoric in which Mr. Blaine was accustomed to open his diplomatic controversies. He ought in common courtesy to have begun by finding out whether any American citizens had been imprisoned under the Coercion Act, but this was much too tame a method for his ardent and impressionable nature. He accordingly assumed at the very outset that the Act had been applied to naturalized citizens of the United States "whose business relations may render necessary their presence in Ireland," or "whose filial instincts and love for kindred may have prompted them to revisit their native country," and then goes on to describe the manner in which these industrious and affectionate creatures ought to be tried, instead of pointing out the absurdity of trying them at all. They should, he said, "immediately upon arrest be informed of the specific crime or offence on which they were held, and be offered an opportunity for a speedy trial before an impartial court and jury," all of which is "essential to every criminal prosecution." But such naturalized citizens as he described and was writing about ought not to have been arrested or tried in any manner whatever, and it was a gratuitous piece of discourtesy to assume that the British Government had done such a thing, or would think of doing it. The decencies of diplomatic intercourse, to say nothing of anything higher, required Mr. Blaine to assume that if the British Government had arrested any naturalized citizen, it had some honest reason for believing that he had not returned to Ireland simply to revisit his aged parents, or prosecute some peaceful and respectable calling. Moreover, it was more than absurd to give the British a lecture on the mode of conducting criminal prosecutions—something with which Lord Granville is probably as familiar as Mr. Blaine—before finding out exactly whether there were any American citizens who were in a position entitling them to the benefit of "those common principles of criminal jurisprudence" to which he called that pampered and haughty nobleman's attention.

Mr. Lowell's answer brought the matter down to the regions of business and common

sense, which Mr. Blaine found so dull and dreary. It was in substance that as the matter in hand was to obtain a speedy trial or release for an American citizen, it would be just as well not to lecture the British Government on the impropriety of passing the Coercion Act, and not to undertake to instruct them as to the proper manner of conducting jury trials in criminal cases. Having thus cleared the ground of rhetorical rubbish, Mr. Lowell seems to have gone to work with businesslike judgment, first to find out what persons, if any, claiming American citizenship were held in dungeons under the Coercion Act; next, whether their claims to American citizenship were well founded; and thirdly whether the British Government would release them if asked to do so. The result has been that of seven persons claiming American citizenship who have been arrested since January most have been released. Of these one is undoubtedly not an American citizen. Another did reside in the United States after the war, during which he served in the Navy, and did apply for naturalization papers, but never got them until 1880, and has now been residing in Ireland and keeping a public house since 1875. He is accused not of "business relations" in Ireland, "or filial instincts or love of kindred," but of participation in an attempt to murder a magistrate. Another, O'Connor, had an interview with Mr. Lowell, described in one of the latter's despatches, in which he disclosed his strong desire for a war between England and America, but admitted that he was a bonâ-fide and permanent resident in Ireland. Although he was a Land League Secretary, Mr. Lowell suggested that he should not be locked up as long as he kept quiet.

In fact, the sum and substance of the whole matter is that everything that can be done through the usual forms of intercourse between civilized nations, to procure the release or trial of every imprisoned Irishman who can make even a show of being an American citizen, has been done, and that these efforts have been remarkably successful and are being continued, although most of the objects are unworthy of either aid or interest.

Only two things more remain to be said about it. One is that the precedents from our own diplomatic history which Mr. Lowell anticipates as likely to be cited against us, have not the importance which he seems to suppose, because they are war precedents. Our arbitrary imprisonment of foreigners, so far as it went, took place while war was actually raging on our own soil, a state of things for which there is no counterpart in Ireland. There the police holds the entire country, the courts are open, and any form of trial that Parliament chooses to prescribe can be peaceably and effectively held. Trial by jury is not, as Mr. Blaine, with characteristic inaccuracy, supposes, a foreigner's right under international law. But some fair trial is his right in time of peace. It is, however, discretionary with every government whether it will use its influence or its power to obtain such trial for its citizens who have infringed foreign laws. The practice of our Government has hitherto been to deal with each case on its own merits, or, in other words, to let a person whose American citizenship is used merely as a means of enabling him to defy the authorities of the country in which he has taken up his abode, get out of his scrape as best he can unless he chooses to come back to the country which he claims as his own, while fully protecting every honest man who has gone back to his native soil from motives either of affection or of lawful pecuniary interest.

SPANISH TROUBLES.

The Sagasta Ministry in Spain has from the first determined to distinguish itself by all sorts of economic reforms; so many, in fact, that if they are all carried out, they will transform the kingdom. It has, however, to be borne in mind, in discussing Spanish affairs, that an immense amount of reform may be effected in legislation in that country of which no trace appears afterward in practice. At the last session of the Cortes, Señor Comacho, the Minister of Finance, carried through very extensive changes in the system of internal taxation, including the reduction or abolition of or change in the mode of assessing stamp duties, mining and real-estate taxes, taxes on agricultural produce, the salt tax, internal tolls on roads and bridges, besides altering the system of keeping the public accounts, suppressing private lotteries, and opening new railroad and telegraph lines. Not content with all this, he provided also for a "conversion" of the public debt, as he calls it, but really for its "readjustment," as it would be called in Virginia, or "scaling down," as it would be called in Tennessee, or its partial repudiation, as it would be and is called in other parts of the world. The Spanish debt has been readjusted six times already within the present century. Each new régime which has come into power has felt unable to pay the interest, but has been too proud to resort to the plan of drawing a sponge over the whole account and making a new departure, although this expedient was actually resorted to in 1746 by Ferdinand VI. He found his father's debts an inconvenient burden, and got a junta, composed of bishops, ministers, and lawyers, to declare that a king was not bound to discharge the debts of his predecessors; whereupon he indulged in a wholesale repudiation, and began borrowing anew, as did his successor, during the troubles following the French Revolution. At the close of the Revolutionary period nobody knew what the debt was exactly, and there were constant disputes about its amount till 1851, when it was decided to be about $550,000,000, and was divided into halves, one being called "active," on which interest was to be paid, the other "passive," on which no interest was to be paid, but which was to be gradually redeemed.

It is needless to say that neither the interest of the active nor the principal of the passive was ever forthcoming. On the contrary, the Government went on steadily increasing what was practically the passive, until, in 1870, the total debt was supposed to amount to about $1,185,000,000. Since then deficits have occurred every year, and the "floating debt"—or debt which could be contracted without borrowing—has been largely increased. In 1876 a scaling operation was again performed, the bondholders submitting to a considerable reduction of the principal in consideration of three per cent. interest to be paid regularly. But it has not been paid regularly, and Señor Comacho now proposes another scaling, by which the principal will be again reduced over fifty-six per cent., but the interest promised is to be four per cent. instead of three. Some of the bonds affected by this arrangement are held in Spain, and the holders of these the Minister has at his mercy. They cannot choose but submit. The foreigners, however, mainly Dutchmen and Englishmen, are not so tractable, and are tired of scaling. They accordingly refuse his terms. They have in their hands, too, the means of coercing him to a certain extent. Before 1876, Spanish bonds had been for a long time excluded from the lists of the London and Amsterdam Exchanges, as a punishment for repeated acts of bad faith; and as long as this exclusion lasted, of course, no fresh foreign loans were possible, and home loans were out of the question—Spaniards, besides being poor, being much too shrewd to lend money to their own Government. In order to prevent this last scaling having the same disagreeable consequences, Señor Comacho asks the foreign bondholders not only to submit to the reduction of their principal, but in doing so to sign a paper acknowledging that "all their rights are wholly satisfied." This they absolutely refuse; and unless they do it, his new bonds will be excluded from quotation both in London and Amsterdam, and his hopes of a new loan nipped in the bud.

His difficulties have been increased by the resolute opposition of the Catalonians, who carry on most of the manufacturing industry of Spain, to the commercial treaty which he proposes to conclude with France as part of his system of economic reform. In this he makes heavy concessions to the French on the cotton, silk, and woollen goods of which the province has until now enjoyed a monopoly. The manufacturers made a determined effort in the Cortes to arrest the negotiations, but without success, and the workingmen, particularly in Barcelona, have of late shown a disposition to rise in insurrection sooner than submit to the competition of "the pauper labor of France." A great deal of violence has already occurred, and more is expected, in anticipation of which the Government has been compelled to pour huge bodies of troops into Barcelona and the other large towns.

Nor is the discontent of the working classes confined to Catalonia. It has shown itself in Madrid and every place else in which there are native manufactures. But it is the Catalonian discontent which is most formidable, because the population far surpasses that of the rest of Spain both in energy and capacity, and is markedly indifferent to the national traditions. It is also much permeated by socialistic ideas, and has a deep-seated hatred of the clergy. In troublous times in Barcelona it is dangerous for a priest to show himself in the streets. This being the case, one might naturally expect that turbulence in such a region would give no comfort to the reactionary party, whether Carlist or Clerical. But, curiously enough, it does. In Spanish politics, it is more than usually true that "it is an ill wind that blows nobody good." The

Opposition to the established Government never had much sense of responsibility, and it has now less than ever. Its great object is always to bring about, in any way that offers itself, the failure of the existing régime. The Republicans are ready to use this weapon against the Conservatives, the Carlists against the Constitutionalists, and the Clericals against everybody who is not a Clerical. Consequently, the turbulence of the Catalonian protectionists, socialists, and infidels, is grist for the Carlist mill, and they are doing their best to take advantage of it. If it could be fanned into revolution, and the present monarchy should disappear in a general *débâcle*, they would desire nothing better, for in a *débâcle* in Spain everything is possible and one thing about as probable as another. They are, however, not likely to be gratified. In the work of economic reform the Ministry has the support of the national Republicans, like Castelar; and the Army, which counts for so much in Spanish politics, has but little sympathy with the griefs of riotous operatives.

THE NEW RULES OF PROCEDURE.

LONDON, March 28, 1882.

THOSE who in America follow the course of English politics must have been surprised to observe the great warmth with which the question of altering the procedure of the House of Commons, by introducing a rule similar to your "previous question," is discussed. You naturally ask, firstly, how it happens that up till now there should not exist any standing order under which a debate can be closed, however long it may have lasted, and however small may be the minority which seeks to continue it; and secondly, why it is that a change which might appear to be a mere matter of general convenience, equally to be desired or opposed by both the great parties, should now be vehemently urged by the one and opposed by the other. I shall try to answer both these questions.

Down till the Reform Bill of 1832 the House of Commons was practically a small body. Its number was indeed very large when compared with the population of the country and with representative assemblies in other countries; but of this large number comparatively few attended the ordinary proceedings. When a great party debate or division was to be taken, members were whipped up from their country houses; but during nine-tenths of the session only a third or a fourth of the total were in constant attendance, and of this number very few took part in the discussions. In the great days of Mr. Pitt and Mr. Fox only some twenty or thirty members were in the habit of speaking, representing the Ministry on the one side and the leaders of the regular Opposition on the other. Moreover, the debates were generally short, as short as those of the House of Lords are now. Even in the decade before 1832, they generally lasted not more than two or three hours in each day, and turned on comparatively few questions, which were discussed with much oratorical dignity, but rather in the spirit and tone of an aristocratic assembly like the Roman Senate than of a body of practical business men dealing with complicated practical questions. The members belonged exclusively to the upper classes; a great proportion of them represented pocket boroughs, and owed allegiance to the owners of those boroughs; the rest were very obedient to the leaders of their party, and controlled by the general sentiment of the aristocratic society to which they belonged. Not only was there no idea of obstruction, but the social pressure was so strong that any member who made himself a bore by long speeches or frequent speeches was very soon put down.

The Reform Bill of 1832 completely changed the functions and duties of the House, but did not so quickly nor so completely affect its composition. It found itself confronted by a host of great administrative and legal problems, which threw on it a tremendous mass of work. The sittings became long, and the topics discussed called out a much larger number of speakers. Assiduously as the House labored, new tasks were always arising, new arrears of work accumulating. At length, after some ten or fifteen years, a class of men began to find their way in who had been previously unknown—men of whom Mr. Cobden and Mr. Bright were the most conspicuous types, who did not belong to the upper ranks, and did not care for the social influences which had hitherto swayed Parliament. They brought in new elements of knowledge, and expressed with force and freedom the sentiments and demands of the middle classes, to some extent of the working classes also. Thus the number of speakers was always increasing, and debates came to be less and less under the control of the recognized party leaders. The immense growth of administrative business, the additional subjects for discussion which were due to the development of trade, the creation of railways, the expansion of our colonial empire, the complaints of the Irish people, whose voice was at last freely heard, the tendency of the House of Commons to draw all sorts of executive matters within its cognizance—all these causes piled up the load of business on the House, while at the same time the always increasing number of persons who attended regularly and wished to speak made it more and more difficult to get this business despatched. At last, about ten years ago, systematic obstruction began to appear. Occasional instances had occurred before, but it was not regularly practised till, in the year 1872, it was employed by some Tory members to delay a bill brought in for alterations in our military system. In the next Parliament these first crude beginnings were followed up by a section of the Irish members, who raised obstruction to the dignity of a science, and succeeded, chiefly by the ingenuity, skill, and tenacity of Mr. Parnell, in all but stopping the Parliamentary machine. The evil, which might possibly have been arrested in its infancy by a vigorous leader of the House, appeared at an unlucky time, because Mr. Disraeli had just quitted the House of Commons. Mr. Gladstone was in opposition, and Sir Stafford Northcote, who led the majority, was new to his duties, and showed himself too kindly and good-natured to act with sufficient severity. Remedies of course were tried, but so far they have proved futile, and the experience of last session, when the deadlock was only relieved by the unprecedented action of the Speaker in stopping an unprecedentedly protracted debate, in which the Irish members had kept the House sitting through forty-two continuous hours, convinced nearly everybody that some stronger measures must be adopted.

This is, in brief, the history of the subject. No provision for closing a debate against the will of any members who seek to go on speaking has existed, because, until some thirty years ago, members belonging almost exclusively to what is called "Society" were controlled by the opinion of Society, and by their sense of party allegiance; and because it is only quite lately that a section of the representatives of Ireland have taken up an irreconcilable attitude. Not, however, that Irish members are the only obstructives. They may claim to have perfected the art, but it is one which members of both the English parties have occasionally employed, and will doubtless continue to employ, unless some means be devised of checking its employment. Add to this the fact that, even apart from systematic obstruction, the House of Commons is unable to grapple with its increasing work, that its debates grow longer because more men want to speak, and more subjects turn up for discussion, and it will easily be seen that our position is a serious one. Something must be done if the popular House is to retain its functions in the government of the country and the empire.

Why then, it may well be asked—and this is the second point I desire to explain—why should so great a reluctance be felt to adopt the obvious and simple expedient of enabling a majority to close the debate by voting that the main question be now put? There are three principal reasons. The first is the strong conservative sentiment of what may be called a corporate body. Englishmen are pretty tenacious of old usage in all things, and wisely so; but in an assembly like the House of Commons the unwillingness of senior members to change the rules they have been accustomed to, even when those rules cause them personal inconvenience, is a notable phenomenon. The second is the idea that, somehow or other, the right of free speech will be trenched upon. So long as every member can have his say there is, it is argued, a security for the expression of every shade of opinion, for the unmasking of any mischievous schemes a Government may contemplate, for the advocacy of unpopular causes. Once this is gone, who can say to what lengths the tyranny of a majority may not proceed? A powerful Minister, supported by a compact majority, may run measures through the House which may seriously affect the rights of particular classes before those classes have had a chance of stating their case in defence. Private members may be refused a hearing; the control of Parliament over the Executive may be reduced to a nullity. Arguments like these affect persons of all parties; not only the Tories, who, of course, oppose a proposal coming from Mr. Gladstone, but also a certain number of more cautious or timid Liberals, and a small number of Radicals. Finally, the whole mass of the Tory party objects to the proposal because, being now in a minority, and expecting to be more often than not in a minority, they think it will be used to silence them, and possibly to bring about revolutionary changes. It is all very well to urge that the House of Commons cannot get on under its present rules: they reply that after all it has flourished for more than six centuries, and that other less drastic measures, particularly the increase of a penal jurisdiction over individual offending members, would be sufficient to restore its efficiency. Many add that they would rather put up with all the inconveniences of the existing system than place themselves at the mercy of a Liberal majority. As to the Parnellite section of the Irish party, they are of course strenuously opposed, because it is they who would be the first subjects of the rule if introduced.

Between all these elements of hostility the position of the Government is not an easy one. A good many of their habitual supporters—some say seventy or eighty—do not like the resolution in which Mr. Gladstone has embodied his new rule. Most of these, no doubt, will yield to pressure—that is, to the threat that if the resolution be lost, Mr. Gladstone will either dissolve or resign. Some few of the more obstinate may vote with the Tory Opposition; others may stay away; but the great bulk, dreading the displeasure of their constituents, will follow the Government. It will pretty certainly secure a majority. But to obtain only a small majority

will be a sort of moral defeat, weakening its prestige, and increasing the risk of its being found in a minority in a division on some of the various minor amendments suggested to Mr. Gladstone's proposal. Besides, it is always a misfortune for a Ministry to have to threaten any of its own supporters. They may submit for the moment, but they resent the appearance of dictation, and do not readily return to their former attitude of loyal confidence. There is, therefore, some anxiety felt as to the issue of this debate, which, having now proceeded for three nights, is likely to extend over many more before the rule is finally settled. Probably the most dangerous division will be on one of the amendments which raises the question whether the power to close a debate ought not to be vested in a majority of two-thirds rather than in a bare majority. This compromise pleases most of the hesitating Liberals and would be accepted by most of the Tories. Mr. Gladstone refuses it because it would involve the leader of the majority in negotiations with the leader of the Opposition, and raise the latter into a position of responsibility, almost of power, for which there is no precedent. Others reject it because they think it would so weaken the rule as to make it almost useless, while at the same time it would bear just as hardly upon the rights of a small minority as would the closing of debate by a bare majority. However, that large class of people who think that a middle course is likely to be right because it is a middle course, look favorably on the two-thirds plan, so possibly the Government may elect rather to yield than run the risk of defeat. Y.

THE DEFEAT OF THE TOBACCO MONOPOLY.

BERLIN, March 28.

THE less expected the more gratifying was the news that the Volkswirthschaftsrath (*Conseil Supérieur de Commeree*) had rejected the tobacco monopoly. In itself this result is of little consequence, as that board of so-called experts numbers only two out of its seventy-five members who are really tobacco experts, the one a manufacturer and the other a planter. All the rest are wholly ignorant of everything concerning tobacco. Besides, the majority is so small—viz., thirty-three to thirty-one—that the decision might just as well have been on the opposite side; but it is nevertheless a great relief, not unmixed with malicious joy, to the great majority of the people. The most exhilarating part of the whole performance, however, has been the discouragement of the official press and of Bismarck's organs, and their subsequent recovery in virtue of certain arithmetical calculations. The Government's "Own," the *Norddeutsche Allgemeine Zeitung*, was richest in the manifestation of this sudden change of mind. For the first two days after the negative vote had been given, it did not dare to utter a word; then it mustered courage and declared that the majority of the Volkswirthschaftsrath had decided in favor of the monopoly. Its reasoning runs thus: "The majority were in favor of a higher duty and tax on tobacco; it is, therefore, the minority only which voted against such raising. A minority, of course, has nothing to say as to how tobacco should be taxed. Of the majority, however, a majority has declared for the monopoly, and this majority of the majority must be respected as the majority of the whole body." I wonder that the worthy paper stops at this calculation in its funny argument. Suppose that among the thirty-one members who voted for the monopoly, there were sixteen who were against allowing damages as proposed by the Government, then the majority of the whole board would have given its vote against a higher indemnification. And let it be further supposed that among these sixteen there were nine who wanted to reduce still more the Government's demands, and that among these nine there were five who preferred to pay no damages at all; then, according to the reasoning of the official press, it would follow, as a matter of course, that the majority was in favor of the monopoly without any payment of damages to the parties now interested in the tobacco trade. Thus there is not the least difficulty in proving that two are a majority of seventy-five. "Speed and alacrity," says the prestidigitator, "is not sorcery" (*Geschwindigkeit ist keine Hexerei*).

When the official mouthpieces of the Chancellor saw that these tricks were laughed at, they proposed that the eleven members who had not been present at the voting should be asked for their vote by letter; but they finally found out that the majority of these men too were against the monopoly. As they did not wish practically to turn to account their ingenious majority calculation, they likewise dropped this new improvement in parliamentary practice. In any other country such a defeat, brought about by a body which was expressly invented and appointed for the purpose of voting the Chancellor's most obnoxious plan, would have buried a measure which from the beginning has been opposed by the people. Bismarck, however, is not the man to submit with grace to a popular verdict. On the contrary, he challenges public opinion, and has no thought of confessing himself beaten. He therefore will not withdraw his pet measure, but will bring it before the Reichstag, to be convoked in May next. First, however, he has to lay it before the Bundesrath. As matters stand at present, he will, in the beginning, meet with a vehement opposition, although he will finally obtain a majority. Of the fifty-eight votes of the Bundesrath, Prussia commands seventeen. She is sure of the votes of the smaller states and of Würtemberg, which poll twenty-two votes together, thus making thirty-nine in all; these, even if one or the other in the last hour should join the anti-monopolists, would still form a large majority over the legally-required number of twenty-nine. Positively opposed to Bismarck on this question are Saxony, with four, Baden, with three, Hesse, with three, and the three Hanse towns, with three together, amounting to thirteen in all. Even should doubtful Bavaria throw her six votes against the Chancellor, twenty votes would probably be the utmost that the Opposition could command.

In the Reichstag, however, Bismarck will be defeated, unless in the meantime he can barter for about one-half of the votes of the Centre. This I think is impossible. It is true, these men are equal to any emergency, and they will be ready to sell their votes for a satisfactory compensation, but what is satisfactory to them will not be satisfactory to Bismarck, who in spite of all the advances made to the Pope cannot come to terms with him. Any prospect of effecting a compromise is now further off than at any previous time, and, besides, the Ultramontanes will ultimately hesitate to make themselves unpopular with their constituents. I therefore consider his endeavors to gain the Centre over to his side as entirely futile. What next? Bismarck will not give up his plan until he has exhausted his last resources. Do not forget that he is bound to raise more money for realizing at least part of his social programme held out to the working classes. When the monopoly is defeated he will fall back on some other method of making tobacco bleed; probably on the American system, as it sharply controls and most heavily falls on the small home manufacturer. This system, in my opinion, will be more unpopular among the masses than even the monopoly, and may possibly reconcile them to the latter. As far as I can judge, the American law is not always strictly complied with: compromises with Government spies, tax-gatherers, and internal-revenue officers are not uncommon; but here the police and Custom-house people will carry out their instructions to the letter, and by molesting the manufacturers and imposing fines drive them to despair, while the profits of the trade will be thrown into the hands of the capitalist and large manufacturer. The only advantage of the American system would be the continuance of Bremen as a large port, the chief importance of which is based on tobacco.

Some people apprehend that Bismarck would dissolve the Reichstag if it voted against the monopoly. I do not think so, because, if he should, he would be sure to obtain, and not in this respect alone, a still more unruly majority against his plans. For the present, however, he needs a more popular pretext, and it is more than uncertain whether he will find one. Other countries try to get rid of or solve difficult problems pressing on them. Here the powerful Chancellor systematically hunts them up for the purpose of intimidating or tiring out the people, in order to make it more subservient to his ends. All he desires is to carry out his absolutistic schemes, which, in spite of their tendency, he knows how to adapt skilfully to a constitutional form. For a long while people did not understand the far-reaching bearing of this policy, but finally they have appreciated its dangers, and they are now on their guard. The charm is broken; the number of his most devoted admirers is daily diminishing, and his popularity is dwindling, to say the least. It will not last long, and Bismarck will stand alone on one side, with nothing but his contemptible tools as his followers, and on the other he will find the intellect, the independence, and generosity of the whole nation his opponents. Even the Second Chamber of the Grand Duchy of Baden unanimously voted the other day against the tobacco monopoly, while in former years no part of Germany contained so many enthusiastic supporters of the Chancellor as Baden. The same can to-day be said of the Liberals of Würtemberg. In Prussia he sues more and more opponents for libel and slander. The Bismarck offence is a standing charge on our court calendars. Among the last indicted is Professor Mommsen, for having said (Mommsen contradicts it) that more and more every day Bismarck showed himself a Merovingian major-domo. At the late supplementary election for the Reichstag held in Bunzlau, in Silesia, in place of the Conservative ex-Minister Falk, who had resigned, a member of the Party of Progress was chosen, while a very able but politically nondescript candidate, Dr. Engel, hitherto the chief of our Statistical Bureau, was defeated.

It is now no longer a mystery, even to the superficial observer of our political development, that we are drifting into a centralization in comparison with which the French governmental machine is almost powerless. Whatever may be the political defects of the German, he hates all centralizing tendencies, and is perhaps too obstinate and too stubborn to submit unconditionally to a majority. It was Bismarck himself who once said, that whenever there were two Germans together, there were three different opinions among them. If it were only in the political field that the Chancellor had successfully concentrated all state functions, his absolutistic aims at unification might be pleaded as an excuse; but he stretches out his hands into domains which belong to the individual sphere of the citizen and never ought to be interfered with. It often seems as if he had set up the Jesuits of Paraguay for his model. At the same time he is

very cautious not to disturb the state rights, which ought to be weakened instead of being strengthened, for he knows very well that on the part of the petty sovereigns he would meet with a very energetic opposition. For this reason the small kings and princes have thus far been his most obedient followers, while the Chancellor tries to prove by his relations to the Powers that he is far from any centralizing tendency. In refraining from violent encroachments upon the reserved rights of the small states, he puts all his energy and influence to work in order to realize his social schemes and to monopolize the whole economical and social life of the country. The state-rights men (*Particularisten*) are so foolish as to believe that they have secured their aims, and do not see that they are only helping to lead the current into a course which some fine day will carry away their dams also.

Before the last elections people could not discern that Bismarck's method was very dangerous to self-government in state and town. They hailed his promises that the Government would charge itself with the care of the poor, the maintenance of schools, and the grant of money to towns for improvements and meliorations. They did not understand that the assignment of the state taxes to the towns and communes implied a gross injustice to the poor in favor of the large real-estate owners, and such a crying inequality for the taxpayer that the solution of this problem cannot go beyond the first stage of experiment. The principal result of our late progress consists in the appreciation of the fact that the power of the Government is swelling gigantically. The intrinsic parts of this process begin to be distinguished by those who till now have been indifferent to the deterioration of our political life. The defeat of the tobacco monopoly marks a salutary change in our public affairs. "No new taxes shall be laid," is the general demand of the Liberals, "before their necessity be proved; but, when proved, we will suffer no new taxes without increasing at the same time those on spirits and whiskey." The next elections will prove this important change. † † †

THE PRECURSORS OF THE RENAISSANCE.

PARIS, March 16, 1882.

M. MUNTZ, the learned librarian of our National School of Fine Arts, has given us a most interesting work on 'Les Précurseurs de la Renaissance.' There is perhaps no branch of literature which blooms like the literature of art, as it combines interesting historical and æsthetic details with the beauty of illustrations. The work of M. Muntz is not the history of the origin of the Italian Renaissance; under the name of "precursors" he chiefly takes the men who in Italy, and more especially in Tuscany, were the promoters of the new ideas, whether they were artists, archæologists, or even amateurs, from Frederic the Second and Nicholas of Pisa to Lorenzo the Magnificent. His work ends before the normal and progressive development—before Mantegna, Leonardo da Vinci, Michael Angelo. M. Muntz notices with reason that there is no exact parallelism between the development of art and the development of literature. The first great precursor, the renovator of the art of statuary in Italy, Niccolo Pisano, lived seventy years before the renovators of classical studies—Petrarch and Boccaccio. The attempt of Niccolo Pisano was, so to speak, premature; a second renovation of art became necessary after him. The victory over Gothic art was not complete at first; it was really only achieved by Brunellesco and Donatello.

Niccolo Pisano has much exercised the imagination of the lovers of art. We know now that he was born in Pisa, and really deserved the name of Pisano; but must we admit, with Messrs. Crowe and Cavalcaselle, with Springer, Schnaase, and others, that he studied art in South Italy and got his inspiration from the models he could find at Capua, at Solerno, at Amalfi, at Troja? Or must we believe, with C. Perkins, Dobbert, Milanesi, Hettner, Bode, that his mind was really formed in Tuscany, and that, by the sole force of his genius, he rose above the vulgar masons of Pisa, of Florence, of Pistoia, of Lucca? "This second hypothesis," says M. Muntz, "which is in accordance with the testimony of Vasari, has now for its partisans all impartial minds. The constituent elements of the style of Niccolo Pisano can all be reduced to the models which the artist found in his native city—that is to say, to the sarcophagi and the vases now preserved in the Campo Santo, and, among them, especially the sarcophagus which represents the history of Phædra and Hippolytus, and which received the bones of the Countess Beatrix, the mother of the famous Countess Matilda." Niccolo afterward visited all the cities of Italy, and was able to study the innumerable remains of antiquity at Rome, Pavia, Venice, etc.

In his 'Origins of the Renaissance in Italy,' Gebhart has passed a very excellent judgment on the work of Niccolo Pisano: "Niccolo, in the pulpits of Pisa and Sienna, and in the coffers of Saint Dominico in Bologna, restored the traditions of the great art with an innocent gravity and a sure taste. He is not a neo-Greek, nor a superstitious antiquarian; he is penetrated with the most general principles of antique sculpture; . . . but his eye and his hand have still the habits of the primitive sculptors: the movements are timid and awkward, the figures often heavy. His works give the impression of those of the end of the Empire. . . . Niccolo Pisano, if he discovered and studied Greece, did not renounce nature, and, in his best works, he is a close observer of life." The son of Niccolo, Giovanni (1240–1320), is a champion of naturalism; he is dramatic, often violent, semi-barbarous. Reminiscences of antiquity are found here and there, but the whole of his work marks the era of the triumph of Gothic style. The same can be said of all the school of the Pisani.

Giotto, the founder of the Florentine school of painting, had not the same advantages as Niccolo Pisano: the frescoes of antiquity were as rare as the remains of antique sculpture were abundant. Still, Giotto was seduced by antique models; he constantly borrowed ideas taken from old monuments. You can see it at Assisi, at Padua, in that Christian monument of art, the Capella dell' Arena. Such traces of antique forms and models can be found in the works of Simone di Memmi, of Ambrogio Lorenzetti, of Taddeo Bartolo. It is a curious fact that Florence, the cradle of the Renaissance, was, in the fifteenth century, very poor in antique remains. The representatives of science, the great writers, became the allies of the sculptors and of the painters. M. Muntz gives us curious documents concerning the precursors of Donatello. In his opinion, the great renovation of the fifteenth century had its origin in the journey which Brunellesco and Donatello made together to Rome, toward 1403. They rediscovered, as it were, the old world; they studied every column, every ruin along the Via Latina or the Via Appia; they had the enthusiasm of genius. Can there be a more original, a more extraordinary creator than Donatello? He is, as it were, a connecting link between the past and the future. Sometimes he humbly copies the antique forms, sometimes he seems jealous of his independence. He is an idealist one day, and the next day a realist; he has a double soul.

Ghiberti was a passionate lover of antiquity: the first book of his 'Commentaries' is a history of art in Greece and in Rome. This essay was probably inspired by conversation with Niccolò Niccoli and Poggio. Rio has remarked the preference which Ghiberti gives to Greek art over Roman art. "What strikes us before all," says he, "is his exclusive passion for Greek sculpture. He keeps a disdainful silence as to the monuments of imperial Rome which he had seen, and makes not the slightest allusion to the collection of statues which was then in the garden of the Medici." Ghiberti describes with much enthusiasm three fine statues which were discovered in his time in Rome, near the church of San Celso. In the doors of the Baptistery of Florence we find some figures which have a purely Greek character. Still, the author of these famous doors belongs to the Middle Ages, and the imitation of antiquity is reduced merely to some details. The style is, on the whole, profoundly Christian.

Alberti was the richest organization of the first Renaissance, the true precursor of Leonardo da Vinci. He was an artist and a humanist; he wrote comedies in Latin; he studied science; he wrote the famous 'De re ædificatoria'; he was fascinated by the monuments of antiquity. I have spoken lately of the temple which he built in Rimini for the Malatestas. He wrote also a treatise on painting; he tried to revive the Greco-Roman world. His friend Rossellino inspired himself with the same principles; he copied in the Palazzo Piccolomini at Pienza and in the first Palazzo Ruccellai the masterpiece of Alberti, which is in Florence.

We come now to the masters who were opposed to the invasion of antique forms and formulas. Lucas della Robbia was the chief of a dynasty which was in opposition to the new ideas; he was purely realistic and Christian; he was a mystic. Masaccio seems to have never even glanced at a Greek or a Roman statue; he was a mere naturalist. So was Panicale da Massolino; so were Paolo Uccello, Andrea del Castagno, Piero della Francesca. The pious Fra Angelico had a true Christian spirit; still, like Donatello, he was capable of understanding the past. His frescoes of the chapel of the Vatican, representing the lives of Saint Stephen and Saint Lawrence, show us "the painter *par excellence* of Christianity sacrificing on the altar of the Greek and of the Roman genius." The thought is Christian; the forms, the composition, the types are influenced by the old models.

M. Muntz not only gives us a profound analysis of the work of the precursors; he enters into minute details about the great collectors and archæologists of their time, Niccolò Niccoli, Ambrosius of Camaldoli, Leonardo Bruni, Carlo Marsuppini, Poggio, and, above all, the Medicis. He describes the court of Cosmo de' Medici and of his children, and explains the great influence of Lorenzo il Magnifico. This family of the Medicis will always be remembered in the history of art. If other sovereigns in Italy can rival them in their sacrifices, there will always be in the efforts of the Medicis a trait which will seduce the historian—I mean the familiarity which was established between them and the artists. They were really the friends of the men whom they protected. Their taste was delicate and severe; their collections became a treasure for the world; their inventories are among the most precious documents on art. Their library was magnificent. The Renaissance never showed a more brilliant organization than Lorenzo de' Medici. He seduced his age by his courtesy, his intellect, his generosity; his mind was universal. He was the first founder of a school of fine arts.

He was a passionate admirer of antiquity, of its philosophy, of its art. He worshipped Plato as well as Praxiteles. He was for a quarter of a century the great arbiter in matters of art. His authority was felt in all Europe. He chose architects, painters, sculptors for all the sovereigns. The artists loved to present to him their choicest works; they knew that they would be repaid a hundredfold. He was so generous that finally he embarrassed his finances. M. Muntz has been able, by using various documents, some of which are inedited, to give us a complete account of the various collections of Lorenzo.

From the time of Lorenzo dates the thorough triumph of antiquity; the antique formulas and types are adopted by all the worshippers of progress. They not only introduce some antique details into Christian subjects—Verocchio, Pallajuolo, Botticelli, Domenico Ghirlandajo, Filippino Lippi delight in some subject taken from the Greeks or from the Romans. Science begins to take the place of inspiration. The old world, as it is represented by these artists of the fifteenth century, is defective; they have not the quiet gravity, the calm simplicity of the precursors; their buildings are too complex, their draperies too much agitated. Giulano da San Gallo, the favorite architect of Lorenzo, has too much erudition and not enough simplicity and majesty. Domenico Ghirlandajo, Filippino Lippi, and Botticelli mark the transition between the precursors and the Renaissance proper; the work of Botticelli is a true mythology. Still, at times, the old Christian simplicity gets the upper hand. It is difficult to understand how the same mind could conceive some "Holy Families" full of angelic innocence, and the "Birth of Venus" or the "Calumny of Apelles" of the Uffizi.

I shall have something more to say on the men who were the enemies of the Renaissance, and who struggled against the return toward the forms and ideas of the pagan world.

Correspondence.

THE *NATION* AND THE CHINESE QUESTION.

To the Editor of The Nation:

Sir: The attitude of religious and political fanatics toward the Chinese question has neither surprised nor wounded the people of the Pacific Coast. But we had reason to expect that such a journal as the *Nation* would treat the subject with some degree of fairness, neither employing the arguments of demagogues nor neglecting the commonest courtesies of debate. To stigmatize the entire population of half a dozen States and Territories as hoodlums, tramps, and vagabonds is doubtless the easiest way to answer their demands, but your history has given us the right to expect something better from you.

But, dropping the question of courtesy, do you really think that the exclusion of an undesirable and dangerous class of immigrants offers any parallel to the enslavement of a class, perhaps equally undesirable, but already firmly rooted among us? Do you think that if, two hundred years ago, some Atlantic California had arisen to prevent the importation of negroes, our subsequent history would have been any less happy than it has been? You speak of the deep "faith of the American people . . . in the power of their institutions to withstand even the vice and ignorance of foreigners." The belief that America was a country under the special protection of Providence, and raised above the dangers of ordinary nations, was prevalent enough thirty or forty years ago, but I had thought that among educated men of our day it was nearly extinct. Observers of our political condition are not blind to the perils of an ignorant and degraded proletariat, and I have read the *Nation* to very little purpose if I am mistaken in thinking that it shares their fears. Do you, then, welcome the precipitation upon us of twenty or thirty thousand possible voters every year, not one of whom will ever have the first glimmering conception of the duties of American citizenship? You seem to fear that the enfranchisement of the negroes may be justified only on grounds of expediency. I confess that expediency, in a broad and high sense, is the only standard of right that I can conceive; and by that standard both the negro and the Chinese question should be judged.

I cannot close without referring to a little matter of detail. You say that "according to the best authorities," the number of Chinese in the country has "sensibly decreased since 1870." Do you rank the United States Census among "the best authorities"? And if so, do you think that in calling an increase of over 67 per cent. between 1870 and 1880 a "sensible decrease" you have displayed your accustomed candor?

S. E. M.

University of California, Berkeley,
March 26, 1882.

[Our history not only gives our correspondent the right to expect better things of us than the stigmatization of "the entire population of half a dozen States as hoodlums, tramps, and vagabonds," but gives us the right to expect of him that he shall not put in our mouths wild and ridiculous assertions which we never made. We have not been guilty of such stigmatization, and we refuse to "drop the question of courtesy"; we uphold it until our correspondent retracts and apologizes.

Coming to his questions, we do not think "the exclusion of an undesirable class of immigrants offers a parallel to the enslavement of a class perhaps equally undesirable, but already firmly rooted among us." We have never made any such parallel, and know nothing about it. Our parallel was between the conduct of the Republican party in forcing the Southern whites to admit the negroes to a share in the government, when they were in a condition of ignorance and debasement from which the Chinese issued thousands of years ago, in spite of the solemn protests of six millions of the white population of ten States, and the conduct of this same party in offering to allow the one million white population of half a dozen Pacific States and Territories to exclude, not from the franchise only, but from all residence and industry on American soil, the poor men of another much more civilized race, no matter what their character. This is our parallel, and the more our correspondent meditates on it the worse he will feel. As to "the deep faith of the American people in the power of their institutions to withstand the vice and ignorance of foreigners," we think that, if it has not as yet gone too far, there is danger that it may do so. What is the remedy? Clearly to legislate against vicious and ignorant foreigners. Nothing of the kind is proposed, however, by our Pacific State friends. On the contrary, they are crazy for legislation against a most peaceable, industrious, intelligent, and skilful class of foreigners, and actually use in the American Congress the very virtues of these foreigners as an argument for their exclusion. Moreover, these foreigners are the only ones who come to us who do not seek to take part in our Government, and thus bring their ignorance into play for our political confusion.

As to the numbers of the Chinese, we shall display our accustomed candor by saying that we have fallen into an error through comparing the population in 1880 with the best estimates of 1876. Between 1870 and 1880 we acknowledge there has been an increase from 63,254 to 105,613, or 66.73 per cent. But the Chinese are, after all, only a little over 100,000 among 50,000,000, and, if they go on at the same rate, will at the end of the century number about 300,000 in a nation of 100,000,000. There is not enough danger in this, on the very worst view, to warrant our total reversal of our policy with regard to immigration, and the revival of legal discrimination of the most odious kind directed against race and color. The probabilities are that in the meantime white immigrants will do much to close the gap into which the Chinese are now entering on the Pacific Coast.—Ed. Nation.]

AGNOSTIC CHURCHES IN GERMANY.

To the Editor of The Nation:

Sir: In your article on "Agnostic Worship," in the *Nation* of Feb. 23, you imply that no attempts are being made in Germany, France, and Italy to build up religious organizations upon a non-theological basis. As to France and Italy, I am unable to speak; but the following facts will show that your implication is wrong in regard to Germany.

In June, 1859, there was formed at Gotha a *Bund freireligiöser Gemeinden Deutschlands*, and at the close of the year 1880 the number of free religious societies and clubs belonging to this *Bund* was 136, and there were, besides, several newly-formed societies and clubs which had not yet joined the national organization. There are at present about twenty active free-religious speakers, some of whom do service for several societies. The facts here given are to be found in the *Freireligiöser Kalender* for 1882, published at Gotha.

There is one of these *freireligiöse Gemeinden* in Berlin having a membership of over eight hundred names. This society has a settled speaker, Herr Schäfer, who addresses it every Sunday morning in "a hall." The speaker offers no prayer and reads from no book. Congregational singing before and after the discourse is the only exercise. Connected with the society is a *Religionsschule*, which is attended by 148 children. To the religious instruction of these children the speaker of the society devotes four hours a week. The children are instructed in the mythology and history and principles of the great historical religions, and Christianity is made no exception, but is treated in exactly the same way as the other religions. Belief in a personal God who can hear and answer prayer, in a divine Saviour, and in miracles, is classed among the superstitions. The children are furthermore taught they have a religion of their own, different from Christianity and the other great religions—a religion based upon ethical and rational principle, and one which has to do with the present life.

This school and society are a fair type of others in other cities, and represent a movement which is gradually assuming considerable proportions. It thus appears that Germany must be added to those nations in which an attempt is being made to build up a religious organization which is both non-theological and non-Christian.

Berlin, March 21, 1882.

THE MASON CRAZE.

To the Editor of The Nation:

Sir: Sporadic cases of this surprising perturbation of judgment or obliquity of mental vision, which seems to have been almost epidemic at the West, have not failed to show themselves even in the latitude of Boston, though most of the legal fraternity agree with the *Nation* in regarding the Judge-Advocate's recent decision as bordering upon the bouffe. An impossibility of success is held to imply an equal impossibility of attempt, so that Mason might have clapped his piece against Guiteau's ear and pulled the trigger without committing an assault with intent to kill, if it afterward appeared that he had accidentally reversed his cartridge in loading, so that it could not explode.

But there are those who, while recognizing the absurdity of this doctrine, have yet signed the petition for Mason's pardon as a protest against the unseemly indulgences granted to Guiteau. It does seem surprising that, in view of our nation's yet recent experiences, so many should still remain in apparent ignorance of the essential difference between an army and a mob. Had the officer in command chosen to make an example of such mutinous conduct on the spot, by cutting down or shooting Sergeant Mason the instant that he turned his piece against the prisoner whom he was detailed to protect, such an act would have been abundantly justifiable; for Mason was a non-commissioned officer, and his conduct a direct incitement to mutiny, calling for stern and instant repression. Those who would condone such offences, or resort to strained technicalities to prevent their punishment, seem to labor under an incomprehensible inability to understand their true nature. They fail to see that the crime is one against the whole community, which for the protection of civil rights looks to the Army to support the law—by no means merely against the one detested wretch for whom the gallows waits. S. M. Q.

Boston, April 4, 1882.

THE WORKING OF THE ELECTIVE SYSTEM AT HARVARD.

To the Editor of The Nation:

Sir: The discussion of the elective system of college work in your columns has shown what results may be supposed, on *à-priori* grounds, to attend such a system. Unhappily, though naturally enough, the products of this method do not coincide throughout with facts. It would be interesting to know what the actual results appear to be, as seen from the inside of the college which has been selected by your correspondents as typical of the elective creed. It would, however, be a delicate task for an instructor at Harvard to take up the matter in print. I venture to hope that an ex-instructor of the same college may render this service—not, indeed, with entire delicacy, but with an indelicacy that admits of pardon.

The common objection to the Harvard system is stated in a letter published in your issue of February 16. The writer is speaking of the time when all studies now required shall become elective, and puts the case thus:

> "What will Harvard's degree mean? Not that the graduate has been trained in the methods of classical, scientific, and metaphysical thought, and introduced to history, political science, and all the more important branches of study. It will mean simply that he has pursued for four years the studies most agreeable to his yet unformed taste—those which are easiest to him, or which look toward his profession. There is an immense pressure in our age, and in every age, for superficial education—something to give reputation and polish at the least expense of time and effort."

Though the passage refers to the future, it expresses a view of the present which is held by many. In opposition to this view, I wish to show (1) that, instead of aiming at a saving of time, Harvard has considerably raised the average age of graduation of her students within a brief term of years; (2) that the foundation of required work on which the "elective" system is constructed is a substantial one; (3) that the results which the elective system has brought about, working in connection with its natural ally, the "honor" system (non-existent in your letters), are such as the system of required work has never produced, at least at Harvard. To this end I shall describe the present state of things as briefly as the case will admit, and shall then allow myself an expression of opinion about the future.

It will be observed that this letter confines itself to the system as it exists at Harvard, and neither alludes to other colleges and universities which, avowedly or not, are in sympathy with Harvard, nor takes up the question whether the elective system would be a proper one to introduce next year throughout the country.

The Harvard of to-day is a complex institution, and its system should be judged, not with reference to one detail alone, but as a working unit. Harvard College is really more than a college: it is a college plus a body of preparatory schools. Harvard has the good fortune to be fed by sources which are quick to respond to any advance in her requirements, whether in methods or in quantity. There is of course nothing as yet in this country that corresponds to the relation existing between the German universities and the *Gymnasien;* but some faint approach to such a state of things is already to be seen in the relation of Harvard to her feeders. Secured by this large source of supply, she has steadily raised her demands and freely rejected ill-prepared candidates. The result is, that she is able to-day to exact a high quality of preparatory work, and that—a very important factor in her system—she is dealing with a maturer class of students than formerly. Statistics for the older classes are incomplete, and statistics at the best are treacherous, unless extending over a considerable term of years; for the fluctuation from year to year is great. But there is sufficient evidence that the average age of graduation is rising. As nearly as the figures at my command will show, the average age in the '60s was 21 years 9 months. The mean average of the last four classes, which is accurately known, was 22 years 4.7 months, or nearly 8 months higher than in the '60s (the class of 1881 reached the remarkable average of 22 years 11.7 months). Or, to put the same thing in another way, at least the larger part of the final year at Harvard is practically a pure addition to her course as it was taken by many men who are still young.

It should be noted that this higher grade of preparation is as marked in respect of quality as in respect of quantity. The examinations for admission are of a kind to exact of the candidate a certain amount of power to work in absolute isolation from all helps. This is most conspicuously to be seen in the test of translation "at sight," which forms an important part of the examinations in languages.

Of the young men selected in this way, the most worthless are weeded out during the first year, under a very watchful process which rests finally upon the test of frequent examinations. The actual depletion of the Freshman class through direct dropping at Christmas-time and in June, and voluntary surrender under fear of dropping, is about ten per cent. The same process is repeated in the following years, though naturally on a less striking scale.

At the beginning of the Sophomore year, the student—whose work, with the exception of training in the writing of English, is to be henceforth of his own choosing—has laid the following foundation: he has passed a somewhat severe admission-examination, after having had the training of some school which is in sympathy with the methods of the college, or after some other training of a kind to enable him to maintain himself side by side with the graduates of such schools; and the sum-total of his general preparation for the more special work of the last three years has covered the following range: Greek, Latin, mathematics, French and German (an elementary knowledge of one of the two is required for admission), and the elements of physics and chemistry. Furthermore, during the whole of this general preparation the aim of the work, so far as lies within the power of the college, has been not merely to make the student acquainted with certain subjects, but to prepare him to develop the power of self-direction.

From this time on, with the single limitation that the student (in the words of the Catalogue) "must satisfy his instructors that he is qualified by his previous training to pursue the courses which he selects," "all the courses given in the college are open to him in making his choice; but he is strongly recommended to make his choice with great care, under the best advice, and in such a manner that his elective courses, from first to last, may form a rationally-connected whole." The advice available to him will come mainly from his parents or from his instructors. In the case under discussion, the great majority of the parents concerned are educated, and are capable of guiding the choice of their sons with more or less intelligence. As regards the advice of instructors (if it is safe to judge from the experience of one of the youngest of them), it is asked and given to a considerable extent, and it will be asked more and more as the intercourse between student and instructor becomes more and more natural. However this may be, whether affected by parents and instructors or not, the choice of the student, though absolute in theory, in practice is largely guided by a certain distinct provision which is at once check and stimulus. This provision (which has not made its appearance in your columns) is the most striking feature of the new system. It is to this, working within the lines of the elective system, that the remarkable record of the last few classes owes its existence. The theory of this feature requires a statement: It is the aim of the college, from the very beginning of the Freshman year, so to train its students that at the end of their course they shall be capable of taking a piece of work into their own hands and prosecuting it successfully, or, in homely language, to teach men to go, instead of being led. Go they must, from the moment they carry home their parchment on commencement morning. Very few of them will find an intellectual mentor ready to take them in hand when their alma mater turns them out of the college nursery. It is the belief of the college—and just here is the key-note of her whole system—that that young man is best trained, for whatsoever occupation in life, who, in addition to a general preparation of reasonable breadth, has acquired also the power of self-directed and self-watchful thought—who, in a word, possesses, on however low a plane of absolute attainment, that trained habit of mind which enables a man to think continuously and accurately; and that a college graduate who lacks this mental habit may have a good deal of information, but is not an educated man.

In consequence of this idea, the system is so arranged as to induce students to concentrate their work in the last three years, and to aim at excellence of scholarship and the acquirement

of the power of self-guidance through advanced study in some group of logically-related members—as, for instance, in the classics, in mathematics, in some combination of the natural sciences. Examinations existing only to this end are held twice in the college course, the first set toward the end of the second year (for second-year honors, so called), the second set toward the end of the Senior year (for final honors, so called). As a condition for presenting himself for one of these sets of examinations, a student (1) must have attained a specified standing in the regular work of the preceding year or years in the department concerned—by which arrangement the spirit of the system is made to reach even the Freshman year; (2) must have devoted to his honor-group a specified proportion of his elective work; (3) must have done, with no help from his instructors beyond an indication of methods and of advisable books, a very considerable amount of specified outside work. (The fact that the student has in this work no instructor and no guide but himself is of the utmost importance.) This done, he presents himself for the examinations, which cover the ground of his outside work, and also test him thoroughly by presenting fresh work to be done upon the spot without help. They are of a high character, and represent that grade of scholarship which can fairly be expected of the student at the stage of the college course to which they correspond.

To meet the case of men who are willing to concentrate their work in part, but not sufficiently to become candidates for honors, the college offers what is called "honorable mention at graduation" to such as attain a high specified standing, in a specified number of hours, in one or more of certain studies.

The result of this double system is that it is fast becoming "bad form" to graduate without the one or the other of these two distinctions. And it may well be believed that it is not only the general sentiment of the students upon which the college can rely in this respect. Not many fathers or mothers who see in the yearly Catalogue the record of honors reprinted from the previous commencement programme will fail to throw their influence in the same direction.

The statistics of the last year, as seen in the Catalogue, are as follows: Second-year honors were won by 26 men (of whom 8 obtained them with the highest distinction) out of a class of 217 men; final honors were won by 28 men (of whom 7 obtained them with the highest distinction) out of a graduating class of 182 men; honorable mention was won by 108 men of the same class, of which number 36 received it in two or more subjects.

Unfortunately, however, no statistics can exhibit the true difference between the scholarship of the college under its present system and its scholarship under the old. We reach here a matter of opinion, hard for any one to judge of who has not known the college intimately under both systems. I beg to offer my own opinion, which is this: that the best men of my own time (*quorum pace dixerim*) were far inferior on the day of graduation, both in working power and in actual attainment, to the best men of the present day. The spirit of the best of us was the schoolboy spirit; the spirit of the best of the graduates of the last few years is the scholarly spirit.

Hardly less important is the influence of these better men that seek honors upon their poorer fellows—say of the 108 honorable-mention men in the last class upon the 74 who did not seek, or at least did not win, distinction at graduation. It is the natural result of the honor and honorable-mention system that the numerical advantage in nearly every class-room lies with the ambitious students who have chosen the subject in question because they distinctly desire that which it has to give. These men set the standard for the class. They are critical, exacting, impatient of any waste of time. They furnish a powerful stimulus and a powerful support for the instructor, and the result is that he can, and does, demand higher work of the whole body of students under him — candidates for honors, candidates for honorable mention, and dullards and shirks that have still survived the weeding-out process—than is possible under the system of prescribed courses. And the result is that, while the best men under the present system are better than the best under the old, the worst men are at the same time less bad than the worst under the old.

As regards the other side of college life, the conduct of the students, the effects of the present régime have been as admirable as in regard to scholarship. Under the more natural relation existing between student and instructor, due in part to the attitude deliberately assumed by the faculty, and in part to the increased interest of the students in the work of the university, and under the constantly-increasing influence of that best of all indirect moral agencies—intellectual interests and a conscious purpose—a standard of student-honor has already grown up which does not differ very appreciably from that of the world at large. With the schoolboy spirit of work is disappearing the schoolboy spirit of conduct. Wherever a firm authority is needed, it is still exercised; but it is rarely needed. It is with difficulty that one who has lodged and lived in the midst of Harvard students within the last few years can believe in the reality of the things which he himself saw as student and as proctor under the old régime. Indeed, one sometimes becomes apprehensive that the sense of humor may be dying out at Harvard, and it is with something like a feeling of relief that one reads of such a bit of mischief as that recent one (conducted, it seems, in a perfectly orderly manner) whereby some sixty students made public confession of their conversion, for a single evening, to Mr. Oscar Wilde's gospel of dress.

The spirit of conduct and the spirit of scholarship in the Harvard of to-day—to put into a single phrase the purport of this over-long letter—were well expressed by Mr. James Russell Lowell in my own time, when he began a course of lectures to undergraduates with words that stirred our boyish hearts: "Gentlemen and fellow-students." It was, in honest truth, only a prophecy then; it is fast becoming a reality now.

So much as regards the present at Harvard. As regards the future, there is no reasonable ground for fear of precipitate action. Those who have watched the process of change know it to have been a cautious and gradual one. No step has been taken until the right to take it has been earned. It is more than probable that all the work of the college will become elective when the preparatory schools shall have been brought up to such a standard as to perform, both in quantity and in quality, the work now done in the Freshman year in the college. It is perfectly conceivable that this generation may not live to see that time; but in the face of the astonishing rise in the standard of admission, especially in quality, within the last twenty years, it would be bold to make any confident assertion to this effect.

The problems of university education in America will probably remain for some time in an unsettled state. Their final settlement will turn upon the settlement of the simple question, What is education? If the answer now given by Harvard is false, then her methods are false, and will in time give way; if her answer is sound, then her methods are sound. For the high grade of working power which she is aiming more and more to produce in her students can be attained only by persistent and partly self-directed effort within the limits of a group of subjects of which the student can grasp the relations in something like the spirit of a specialist. But this method requires concentration of work, and that concentration is possible only under the elective system.

Respectfully yours, W. G. Hale.

Ithaca, N. Y., March 31, 1882.

Notes.

James R. Osgood & Co. are to publish the authorized edition of the works of the late President Garfield, now being carefully prepared and edited by President Hinsdale, of Hiram College. It will make two octavo volumes, and will probably leave the press toward the close of the year.

'Rousseau,' by Henry Graham, will form the seventeenth volume of Mrs. Oliphant's "Foreign Classics for English Readers," of which J. B. Lippincott & Co. are the American publishers.

Wm. Chambers's 'Story of a Busy Life,' and 'Toward the Sunrise,' a book of travel, by Hugh Johnston, are among this month's issues of R. Worthington.

G. P. Putnam's Sons have nearly ready 'Thomas à Kempis and the Brothers of Common Life,' by the Rev. S. Kettlewell, in two volumes 8vo.

A. D. F. Randolph & Co. publish immediately 'Saunterings in Europe,' by Charles Wood.

Simultaneously with the completion of part 4 of Skeat's 'Etymological Dictionary of the English Language,' Macmillan & Co. announce that they have arranged with Oxford University for a cheap edition, specially made for the American market, and unabridged. It is almost ready.

Mr. Samuel Hollyer, 27 Warren Street, New York, invites subscriptions to a line and stipple engraving representing the late Henry W. Longfellow in his library. The prospectus indicates less familiarity with the pen than (we may assume) with the graver on the artist's part.

Longfellow's 'Hyperion,' on which, apparently, the copyright has lapsed, has been published in paper covers by the John W. Lovell Company, of this city, in good clear type, and at a very moderate price.

'Bay-Path' and 'Arthur Bonnicastle' are the two latest volumes in the Messrs. Scribner's uniform, handy, and tasteful reprint of the late Dr. Holland's works.

Professor Newcomb's 'Popular Astronomy' has undergone a fourth revision, and, as now published by the Messrs. Harper, contains new matter relating to the great telescopes completed within the past three years, the recent development in cometary astronomy, and the approaching transit of Venus on December 6. These changes are not relegated to an appendix, but take their proper places in the body of the work, thus implying a further periodical revision, which a standard work of this character deserves.

A catalogue which combines antiquarian interest and legal utility has just been published by R. D. Cooke, 73 Cortlandt Street—namely, 'Old Streets, Roads, Lanes, Piers, and Wharves of New York,' by John J. Post, of the New York Bar. The arrangement is simple and lucid, the streets being enumerated alphabetically, first by their former and then by their existing names, with parallel identifications in each case. A third part of this thin volume shows the various street extensions and widenings, or *vice versa*. The labor of such a compilation merits

a full reward. As a sample of Mr. Post's scrupulous minuteness, we quote the ancient synonyms for that part of Nassau Street which lies between Wall and John Streets: "The Pie-woman's Street. The street that leads to the pie-woman's. Street that leads to the pie-woman's. Pie-woman's Lane. Pie-woman's Street."

Mr. H. P. Hubbard's 'Newspaper and Bank Directory of the World' (New Haven) does not differ very much intrinsically from similar undertakings, so far as the American portion is concerned. This fills volume i., which is distinguished from its companion by a greater abundance of illustrations, and these, it must be admitted, very curious. There is a large number of reduced facsimiles of newspapers, old and new, of all nations; views of newspaper offices (pretty ugly, as a rule); and photographs of editors, with abundance of information about the history of printing and of presses. Then there are maps of the United States and of the several States, and physical and statistical accounts of each in the fashion of a gazetteer. The same scheme is pursued with vol. ii., which alone contains the list of banks and bankers and information pertinent thereto. Many of the general articles are in French, German, and Spanish, as well as in English. On the whole, the enterprise bears the marks of great energy, method, and intelligence. Two statements in this 'Directory' are worth remarking: that nearly one-third of our American weeklies are "patent insides" (or "outsides," or "auxiliaries," or "coöperatives"); and that 31,411 of the total 34,274 journals of the entire globe are published between 30° and 60° north latitude.

Ginn, Heath & Co., of Boston, publish a sheet of cardboard, with test-types, for the use of teachers in ascertaining the existence of near-sight among scholars. The type is clear and suitable. All such aids in popularizing a most important branch of hygiene ought to be welcomed.

G. P. Putnam's Sons have published, at the instance of the State Charities Aid Association, a little work, on 'First Aid to the Injured,' which appropriately bears on its cover the Geneva red cross. It is designed as a manual for classes now being extensively formed for instruction in this "first aid."

Mr. H. Courthope Bowen's 'Shakspere Reading Book' (Cassell) has the usual defects of abridgments, expurgatory and other, of the poet. Still, the editor's views on the *quality* of reading in public schools are eminently sound, and too little appreciated in this country, as he says they are in England. The book will well serve his end; and of course, without cutting, this use of Shakspere becomes impracticable.

Among recent classical text-books we may mention, as on our table, Madvig's edition of Cicero's 'De Finibus' (Harper's), a nice thing for the pocket; and the Clarendon Press Livy, books v.–vii. (Macmillan), a little larger than the foregoing, and well supplied with English notes. The text is Madvig's.

Electricity fills a large space—some eighty pages—in M. Louis Figuier's 'L'Année Scientifique' for 1881, which promptly reaches us (New York: Christern). The frontispiece, indeed, pictures the late International Exposition of Electricity, and a special section is allotted to it. America, of course, comes prominently upon the scene here, as in the section on public hygiene, because of the trichinosis scare. The planting of American vines is still noted as one of the defences against the phylloxera. Littré leads the Necrology, and a definition of him by a niece of Lamartine —"C'est un saint qui ne croit pas en Dieu"—is fitly quoted. Dr. I. I. Hayes and Prof. J. C. Watson are the only American men of science whose deaths are here recorded.

A new 'Constitutional History of England,' by Professor Gneist, is announced to be shortly forthcoming.

Aid is still needed for the American Archæological Institute's Assos Expedition, which resumed work on March 1, with the added assistance of a young Danish architect of distinction. The results thus far fully justify the prudent outlay. Contributions may be sent to Prof. C. E. Norton, at Cambridge, Mass.

—D. Lothrop & Co., Boston, have recently published a book by Wm. F. Bainbridge, under the title 'Around-the-World Tour of Christian Missions: a Universal Survey.' What claim this title has to accuracy may be stated in a moment. The author made his somewhat leisurely circumnavigation in 1879–80, starting from Providence, R. I., and following for the most part the beaten tracks. He visited Japan and China, and a few Protestant missionary stations in the East Indies and Syria, returning to Europe by the Suez Canal. How many stations he actually saw it is not easy to make out from this wordy narrative; it may have been one in fifty of those which would be included in a "universal survey of Christian missions." Mr. Bainbridge does not even give a description of those he professes to describe. Thus there is a chapter on the "Sandwich Islands, Alaska, and Siberia"; turning to which, we find the author on board of a steamer in the mid-Pacific Ocean, and reflecting that "in this vast solitude it is a little comforting to think that only a thousand miles away are the Sandwich Islands." We do not learn whether a reciprocal sense of "comfort" was felt in Honolulu. This was his nearest acquaintance with the group; except for a rambling and inaccurate mention of the Hawaiian mission, his "survey" goes no further. The book is worthless, except for a list of missions given in an appendix. Mrs. W. F. Bainbridge's companion volume, of 'Round the World Letters,' reproduced from the journals to which they were written, has a certain sprightliness of style. It does not pretend to be a "universal survey" of anything, and it is at least free from cant.

—Mr. Alexander Johnston's little handbook called a 'History of American Politics' (Henry Holt & Co.) passes to a second edition with its seventh thousand copies, and offers a sum total of forty additional pages. The quite new matter consists of a very useful appendix of nine pages, exhibiting the Cabinet officers of the several Administrations, with their dates of appointment; and, besides many minor revisions, the period since Johnson's Administration has been especially worked over, the whole ending with the accession of President Arthur. Of this manual we need not repeat our praise: it is at once a bird's-eye view and an index, and deserves to find its way into every school of the higher grade, where the special knowledge of the teacher will have scope for indefinite expansion concerning any topic, character, or period. It is, perhaps, in strictness rather to be called a diary or an annual than a history, for its plan does not permit the exposition of political development upon this, that, or the other line. The significant event is noted in its proper place, but we miss its antecedents, and its consequences are not always apparent as such. The anti-slavery movement is a good instance of this. Precisely this defect is overcome in the ingenious and admirable 'Handbook of English Political History,' edited by Mr. Dyke Acland and Professor Ransome, and lately published in London by the Messrs. Rivington. First we have, on the right-hand page, the course, year by year and month by month, of political occurrences, with not infrequent references to the left-hand page for details —of a bill, of a ministry, of a pedigree, of a treaty, etc.—which would have encumbered the diary. Often a good deal of blank space is left for the student's own notes, and the right-hand third of the same page is devoted to contemporaneous events in foreign countries. This is all capitally executed, and, let us add, in very handsome typography. But now follows a series of "Summaries," arbitrarily chosen, of course, but with just knowledge and proportion, and which show chronologically the growth of the powers of Parliament, the drift of matters ecclesiastical, the significant dates and deeds in Welsh, Scottish, and Irish affairs, the steps toward Union, the French and American wars, the struggle for the Corn Laws, the romance of India, the march of Reform, and the like. This synthetic complement of the first part leaves nothing to be desired in the idea of a political manual, and we would counsel Mr. Johnston and his publishers to profit by so excellent an example. We should almost be prepared to recommend imitation also of the arrangement of the first portion, even if it involved the entire resetting of the "History."

—In Mr. Cutter's report to the proprietors of the Boston *Athenæum*, on the completion of his herculean catalogue, he recites a number of laughable errors detected in the work after he came to it. One was the mistaking of *ganz* (Deutschland) for Ghent—"French *Gand*," it was explained. A different sort of mistake was the failure to enter "G. W. Dasent's 'Tales from the North,' which is a translation of Asbjörnsen and Moe's 'Norske Folkeeventyr,' under Asbjörnsen. While Mr. Cutter was exposing this shortcoming, the *Athenæum* was printing a controversy which indirectly exculpated the cataloguer at the expense of the translator—Sir George Dasent had studiously omitted to mention Asbjörnsen as the author whom he was reproducing. Such is the complaint of Mr. H. L. Brækstad, who brought out at Christmas time (through Sampson Low) a translation not only of the 'Folke Eventyr,' but also of the second series, the 'Huldre Eventyr.' Copies of 'Round the Yule Log,' as the book is called, reached this country somewhat past the time for seasonable notice, but we cannot regard it as too late to recommend the pretty volume to all parents, for their children's sake and for their own. The translation is more racy than Sir George Dasent's, as we recall the latter, and it has, what was altogether lacking there, the personal element of the story-teller—the setting of adventure, incident, landscape, weather, which gives an inexpressible charm to Asbjörnsen's tales. Add to this that the illustrations are Norse and not English, and capital in their way. Mr. E. W. Gosse furnishes a brief introduction, and there are portraits of both Asbjörnsen and Moe.

—We are at a loss what to say of another child's book, bearing the same London imprint, which has been lying beside 'Round the Yule Log' on our table. The Norse trolls and witches offer sufficient to alarm and repel the mind of a sensitive child, even when Asbjörnsen represents and reports them; but Mr. Bram Stoker's 'Under the Sunset' has terrors which cannot so easily be shaken off. The first part is an allegory of Paradise Lost, in which the entrance of sin takes the form of a pestilence, and the youthful reader is led along by such cheerful running-titles as "The Scoffer Stricken," "The Ice-cold Hand," "Warning of Danger," "The Procession of the Dead Past," etc., and stimulated by occasional sentences like this: "Lonely nights—black want, cold, hunger, and pain; and through all these darkening shadows the swift moving shadow of the Mother's flying feet." The story of David and Goliath is served up anew, with a nightmare etching of the giant's overthrow. The book ends

with some illusory attempts at humor, still more or less combined with moral allegory, for which the author of 'Alice in Wonderland' may be, but ought not to be, held responsible. To say that no child should be encouraged to read 'Under the Sunset' is not the same as passing judgment on its readability; but that is a secondary matter. The illustrations on copper are striking if gloomy, and in some degree vindicate the author's imaginativeness.

—The circular reading-room of the British Museum, with its superintendent's desk in the centre, from which he has a clear view of the whole room (like the warder in Bentham's Panopticon), the great catalogue circling round this central post of observation, and the lines of readers' desks radiating from that to the walls, where 20,000 selected volumes are arranged at their unrestricted disposal, is at once so simple and convenient that it has excited great and deserved admiration in England. It is one of the features of the metropolis of which Londoners are proud, although it was designed by a foreigner. Its simplicity, far from detracting from the credit of the design, is seen to be like that of Columbus's egg—the simple plan that comes to the man that thoroughly understands his subject, and to him only. It has been always understood that it was made from Mr. Panizzi's drawing; and that there might be no mistake about it, the architect wrote to Mr. Panizzi in 1858: "I feel no hesitation in stating that the idea of a circular reading-room with surrounding library, and with divisions formed wholly of bookcases, was perfectly original and entirely your own." Mr. Panizzi evidently agreed with him—at least he never contradicted Mr. Smirke. And yet there is in existence a copy, *presented to Panizzi by the author* in 1836, of a 'Mémoire,' by M. Delessert, in which a circular library is proposed so like Panizzi's that the ground plan might easily be mistaken for that of the Museum reading-room. There is this difference, that in M. Delessert's plan the space occupied at the Museum by the catalogues is devoted to readers, and the Museum's radiating readers' desks are, in Delessert's plan, radiating book-shelves. Panizzi's modification would easily occur to any one who wanted more room for readers than was afforded in Delessert's arrangement, especially if he had Delessert's plan before him. On the other hand, the coincidence may be merely the result of an impression received, forgotten, and, after lying dormant for twenty years, revived when circumstances made it useful. Or finally, it may be one of those common cases in which two minds, working on the same problem, arrive at the same result. Panizzi had no need to appropriate the credit of other people's ideas.

—An essay by Dr. Brinton, which has just appeared in a pamphlet, treats of 'The Names of the Gods in the Kiché Myths.' These myths are recorded in the Kiché book called 'Popol Vuh,' the most substantial remnant of aboriginal literature which has come down to us from the pre-Columbian time. Concerning this book Mr. Bandelier wrote, in his paper on the "Sources for Aboriginal History of Spanish America," "We do not hesitate to say that American aboriginal history has no document or source whatever which is more valuable than the three last parts of the 'Popol Vuh'; but we are equally convinced that a closer study of the Indian language in which it is composed is absolutely needed. A new translation of it should be undertaken." A careful study, if not a new translation, of this unique document seems to have been undertaken by Dr. Brinton, who seeks to "analyze the proper names of the divinities" which appear in the pages of the 'Popol Vuh'. His special facilities for this task, in addition to his familiarity with the mythological field, consist in certain manuscript vocabularies and grammars of the Kiché and related languages, which are in his possession or at his service. The essay, we are glad to say, is an honest and thorough piece of work, indicating a considerable advance upon anything thus far produced in the Central American field. Dr. Brinton complains, doubtless with good reason, of the "extreme paucity of material for studying the Kiché," and says that, with the exception of a brief vocabulary of the principal roots by Ximenez, "no dictionary is available"—which may be either a momentary oversight, or an utter discrediting by implication of Brasseur's 'Grammar of the Quiché Language,' which contains a vocabulary of eighty octavo pages. Mr. Bandelier, in the valuable essay above referred to, expresses strong suspicions concerning the aboriginal origin of certain portions of the 'Popol Vuh,' especially of the cosmogony embodied in the first part, where he finds traces not only of the Mosaic traditions, but of the "Logos" doctrine of the Gospel of St. John, and says: "Whatever signification may be attached to the Logos, its conception as an acting individuality, a personal spiritual being, is certainly not Indian." From this view Dr. Brinton emphatically dissents, expressing the conviction that "such an opinion will pass away when the original is accurately translated." Nevertheless, the 'Popol Vuh,' in the only form in which we know it, originated after the Discovery, and was reduced to writing by some one who had come under missionary teaching. It is only to be expected, therefore, that traces of Christian thought should appear in it; how much of this element there is in it can be decided only after the document becomes thoroughly familiar to us.

—On another point, which is attracting more and more attention, Dr. Brinton's essay will enable his readers to come to more enlightened conclusions—namely, the place of the Central American peoples (and the Mexican) in the line of human culture. A tribe whose religious beliefs were as crude, and their practices as gross, as those of the Kichés seem to have been, can hardly be regarded as having attained to the conditions of civilization. The late Lewis H. Morgan endeavored, in various works of his, to make people see that the name "civilization" was a misnomer as applied to any of the American tribes or "nations." The more carefully the aboriginal status of these tribes is studied, the more evident it becomes that Morgan was right; and now that he is gone, it is interesting to note the gradual but sure spread of his thoroughly rational views. The temptation to extravagance is greater in the Central American field than anywhere else; but Dr. Brinton speaks with a caution quite in contrast with the old-fashioned random talk. While Dr. Le Plongeon and M. Charnay fairly revel in the conceptions they have formed of a rich and grand civilization once occupying the Central American region, Dr. Brinton simply speaks of the Kichés and Mayas as the race "which approached the nearest to a civilized condition." This is the phraseology of the opening line of his pamphlet; but on page 27 he speaks of them as "these secluded and semi-barbarous tribes." By "semi-barbarous" he means, of course, semi-civilized; but such designations are very unsatisfactory. Would it not be a great gain if some such nomenclature as Morgan suggested in his 'Ancient Society' could be generally adopted, so that the status of barbarism, in which all the American races were included, might be distinguished from savagery on the one side and from civilization on the other?

—A number of well-known lawyers of this city have united in an appeal to the friends of Harvard University, and especially of the Harvard Law School, for the purpose of raising a fund to add to the endowment of the Law School library. A fund of $40,000 has already been secured, but from $30,000 to $40,000 more is needed. Those who know what an important part the Law School at Cambridge is playing in the elevation of the standards of professional education, will be surprised to learn that of all the Cambridge schools it has the poorest endowment. The total endowment is a little over forty-eight thousand dollars ($48,070 63); apart from the income of this fund the school lives upon its earnings. On the other hand, the Scientific School fund is set down at nearly eight hundred thousand dollars ($765,519 71); the Divinity School fund at over three hundred thousand ($310,833 90); and the Medical School fund (deducting their building fund of over $160,000) at nearly a hundred and nineteen thousand ($118,619 18). It may be added that vigorous efforts are now being made for the increase of the medical endowment. On the other hand, the expenses of the Law School have greatly increased. There are now five professors and an instructor, where there were formerly only two and afterward three professors; and the professors, instead of being paid two or three thousand dollars, have now the not excessive salary of forty-five hundred dollars. On the other hand, instead of admitting to its degree any person who chooses to attend for eighteen months, the School now requires a three years' course of study, a thorough examination for the degree, another thorough examination in order to pass from one year to another, and, in the case of all who have not had the discipline indicated by a college degree, an examination for admission. The average expenses of the library for books and binding during the last ten years have been $3,289 26. In this period an undesirable economy has been practised, and much that was needed has been left unbought. A fund of $60,000 would hardly supply what has thus been paid; it is very desirable that it should be larger. It is hoped that New York will add to the $40,000 already provided enough to put the library of the School on an independent footing. The appeal is signed by Dorman B. Eaton, William G. Choate, James C. Carter, Joseph H. Choate, and other well-known members of the bar.

—The regular musical season is approaching its close. Already the Symphony Society has given its last concert, and other societies will soon follow its example. Dr. Damrosch had chosen an ambitious and attractive programme—Beethoven's great "Leonore" overture, and Berlioz's dramatic symphony "Romeo and Juliet." Beethoven's popular overture, which is really a perfect drama in a nutshell, is always welcome, and its presence on this occasion enabled the audience to estimate the value of Berlioz's proud boast to Fétis that he "took up music where Beethoven had left it." Perhaps also it was intended by the juxtaposition of these two works to suggest that Berlioz got his hint for the invisible chorus behind the scene in the third division of the symphony from the thrilling trumpet call in Beethoven's overture. Nevertheless it would have been better had the overture been omitted. The symphony is very long in itself when given without cuts, and a concert should never extend beyond two hours. In performing it the orchestra had the assistance of the Oratorio Society, and Miss Lena Little, Mr. Toedt, and Mr. Remmertz as soloists. Mr. Remmertz has not sung so well on any previous occasion this season, his voice displaying, especially in the air in

the last division, a sonorous strength and vigor suggestive of Herr Betz of Berlin. The other soloists also did well, and the chorus and orchestra executed their tasks with an appearance of ease and confidence, and a display of enthusiasm, that showed most of the good points in the work in a clear and favorable light. The most serious criticism applies to the limited chorus in the first division, which in the brief unaccompanied passages so completely lost the pitch that the reëntrance of the instruments produced a jarring discord. The audience vigorously applauded the leading numbers, especially the "Mab, bright elf of Dreamland," for tenor solo and small chorus, which had to be repeated, although, like the Queen Mab scherzo for orchestra alone, it is rather an empty and uninteresting piece of music. The same may be said of the famous adagio, which begins beautifully, but ends in a dreary waste of sound. The whole symphony, truth to tell, leaves a depressing and monotonous feeling in the listener, the only two numbers which display true inspiration being the grand final chorus and the concert and feast at Capulet's house, in which latter the vigorous pulsation of the rhythm and the combination of motives produce a stirring and almost delirious effect.

—Berlioz, who, during his lifetime, could only get his works performed by undertaking concerts of his own, alludes in many of his letters to the sensation created by selections from his "Romeo and Juliet." Thus he writes to his friend Ferrand from London in 1840, that the symphony was again the cause of many tears, "passions inconcevables," and brilliant conversions. The enthusiasm culminated in an Englishman's buying the bâton with which Berlioz had conducted, for five pounds. Three months later, at a concert in the same city, the meaningless phrase assigned to the trombones in the Introduction was interrupted at its third repetition by salvos of applause! It was, forsooth, a novelty, and received tribute as such. The three principal objections to "Romeo and Juliet" can be briefly summed up in a few sentences. The first relates to a personal matter. The tender and pathetic character of Shakspere's play was not so well calculated to arouse Berlioz's creative powers as those subjects in which a bizarre, colossal, volcanic, stupendous tone prevails. The second is an æsthetic and formal objection. A programme prefixed to a symphonic poem is of advantage in so far as it indicates the emotions which inspired the composer to write his work. But a "dramatic symphony," in which choral recitatives and choruses alternate with solo pieces and instrumental numbers in an endeavor to give color to a dramatic subject, errs in so far as it compels the hearer to endeavor to harmonize the details of the music with the details of the plot and action, without giving him the advantage he has in an opera of beholding with his eyes the pictorial scenes which the ear fails to detect in the music. The general formal objection to the oratorio is simply exaggerated in such a "symphony," based on a dramatic subject. The third objection is purely musical. Berlioz was so great a master of instrumental coloring that, as we may say, he covered his canvas with tints before he bethought him of his figures. In other words, he too frequently lacked ideas. Composing was hard work for him. Had he but united Schubert's incessant flow of ideas with his own marvellous instinct for fine instrumental combinations, he would have been the greatest of modern orchestral composers.

THE ENGLISH CONSTITUTION FROM 1760 TO 1860.

The Constitutional History of England from 1760 to 1860. By Charles Duke Yonge, M.A., Regius Professor of Modern History, Queen's College, Belfast. London: Marcus Ward & Co.; New York: Harper & Bros. 1882.

"A LETTER," writes Mr. Yonge, "of the Prince Consort examines the principle of ministerial responsibility with so remarkable a clearness of perception and distinctness of explanation that we may be excused for quoting it at length: 'The notion that the responsibility of his advisers impairs the monarch's dignity and importance, is a complete mistake. Here we have no law of ministerial responsibility, for the simple reason that we have no written Constitution; but this responsibility flows as a logical necessity from the dignity of the Crown and of the sovereign.'"

Much ignorance of English life is pardonable in a prince and a German; but an English professor of history who endorses with his approval the natural mistakes of a royal and foreign pedant cannot hope to escape censure. Now, the sentences selected by Mr. Yonge for special commendation are as curious a specimen of the mode in which words may conceal facts as can be found in all literature. The "notion" which is denounced as a "complete mistake" is a simple truth. The responsibility of Ministers, not to the Crown, but to Parliament, is and must be a diminution in the power, and therefore in the importance, of the throne. Such responsibility has been, and always must be, hateful to despotic or autocratic monarchs. Hence Prince Bismarck, and men like him, will not for a moment tolerate it. Even the Prince Consort might, one would have thought, have reflected that the very reason why constitutional or democratic revolutionists insist upon ministerial responsibility is their desire to limit royal authority. Responsibility will always in the long run go hand in hand with power. This results not from any legal fiction, but from the laws of human nature. To fancy that a monarch can be powerful while his Ministers are responsible to the nation, is as absurd as to think that a man can be master in his own house while somebody else pays and controls his servants.

The professor who instructs his students that the importance of the Crown is not diminished by the Parliamentary responsibility of Ministers, shows that he is a slave to words, and that he lacks the quality—of being able to distinguish fact from fiction—which is the most essential of all qualities in a person who undertakes to narrate and to explain the development of that mass of laws, conventions, practices, habits, and sentiments which passes under the misleading title of the English Constitution. For the marked characteristic of constitutional history during the century covered by Mr. Yonge's work, is this: the Constitution of England underwent a radical and essential change, amounting to something like transformation into a new system of government, while the forms of the Constitution underwent scarcely any alteration whatever. Hence it is a matter of the utmost importance, and at the same time of the utmost difficulty, to distinguish with the most careful discrimination forms and realities. To do this requires much knowledge and still more insight; for in all English institutions names and things, shadow and substance, are divided from each other by no sharp and clearly-drawn line. What was reality yesterday may be little more than form to-day. We all know, for example, that the Queen's actual power falls infinitely short of her theoretical authority. Every one understands that the will and the intentions of Mr. Gladstone are of far more importance than the wishes of Queen Victoria; but no one out of the Cabinet, and few perhaps within it, can tell with certainty where the actual and still less where the possible authority of the Crown begins or ends. The child who dreams that the Queen sits crowned upon her throne, and rules over the British Empire in the same sense in which Louis XIV. governed France, is a little more—and perhaps only a little more—astray from the truth than the Radical who fancies that the will or the caprice of the sovereign goes for nothing in the government of England.

A writer, therefore, on constitutional history is certain to be a blind leader of the blind, unless he be gifted with what may be termed a sense of realities. This endowment is a rare one. Mr. Yonge assuredly does not possess it. Of the outward and, so to speak, visible facts of his subject he knows as much as may be gained from the pages of Sir Thomas May, to whom he owes a debt which, as far as we have observed, he never acknowledges; but of the spirit, the real nature, the life of the Constitution he knows nothing. A page of Bagehot's 'English Constitution,' a chapter of F. D. Maurice's far too little known essay on the 'Representation and Education of the People,' will teach intelligent readers far more that is worth knowing than a hundred such works as Prof. Yonge's dreary manual. Yet the subject with which he deals might, in spite of its difficulties, have evoked, one would have thought, some remarks worth making and remembering. For Mr. Yonge's account of constitutional changes, though dull, flat, and commonplace enough as a narrative, is not altogether profitless or unsuggestive reading. The mere enumeration in chronological order of the patent alterations in the Constitution of England must suggest to many intelligent readers reflections which seem never to have occurred to their teacher. Any one, in short, who will try to look through words and forms to things and realities, may, from Prof. Yonge's book and from ordinary knowledge of English literature and of modern England, draw some more or less important inferences as to the essential differences between the Georgian Constitution of 1760 and the Victorian Constitution of 1860.

It is, in the first place, absolutely certain, let princes, pedants, or professors say what they like, that the importance of the Crown was far greater in the middle of the eighteenth than in the middle of the nineteenth century. The will of George III. went for much more in all political matters, whether great or small, than does, or at any time did, the will of his granddaughter. The King, when quite young, and without either prestige or experience, drove the most popular statesman of the age from power. At a later period he kept in power by his own will a Minister who had the support neither of popularity nor of success. If the accession of Pitt not only to office but to authority was in one sense the defeat of George's efforts to establish his own personal government, it was also the rout of the King's foes. Pitt himself was, as all the world knows, hampered at every turn by the King's wishes and (what was always the same thing) the King's prejudices. George's liability to madness rather increased than lessened his influence. With that strange cunning which is often combined with mental unsoundness, the monarch drew no small advantage from the threat that he might at any moment go mad. Ministers who suggested Catholic Emancipation were held by all persons of good feeling to be heartless brutes, prepared to risk the chance of driving the sovereign into a lunatic asylum. Nor did the royal influence really depend on the character of the monarch. People may have revered the "good old King," but Tories and Whigs alike supposed that the whole policy of the nation might be at once changed by the accession

to power of the bad young Prince. No one can assert that the expectation was groundless. George III.'s two sons were each of them real powers in English politics. That Catholic Emancipation was delayed till 1829, that the Reform Bill was carried in 1832, was due in great part to the character of George IV. and of his brother. If the one had been a little wiser, O'Connell might never have become the liberator of his countrymen; if the other had been a trifle more obstinate, a revolutionary movement might have swept away both the House of Lords and the throne. No one can believe that the Queen, whatever may have been her secret influence (and future memoirs will probably show that it has not been inconsiderable), has played in English politics anything like the part played by her grandfather or her uncles.

In such matters, unnoticed trifles are even more instructive than the greater political transactions which excite general attention. Take, for example, the change which almost imperceptibly has come over the exercise of the right of pardon. Of all the prerogatives of the Crown, none would seem to be more personal to the monarch. There was undoubtedly a time, and that not a very distant time, when the sovereign really could determine whether a criminal should or should not go to the gallows. The story of Effie Deans's pardon is a fiction, but it is a fiction true to fact. The scene painted by Scott might well have taken place at any time during the reign of George II. or of George III. The King sent the Perreaus to the gallows; the King (greatly to his credit) insisted that Dr. Dodd should meet with his deserved punishment. The King might, had he chosen, have pardoned any of these forgers, and great pressure was put upon him to pardon the clerical culprit. All this is now changed. No act of Parliament has restricted the royal prerogative, but a modern Effie Deans would not seek or obtain an interview with the Queen. She would have recourse not to Her Majesty, but to the Home Secretary. The prerogative of pardon has, in short, passed from the Crown to the Cabinet. In this case it may well be doubted whether a constitutional change is also a constitutional improvement; but however this may be, the change is as certain as it is remarkable. A sovereign who has ceased to have the right to pardon may retain dignity, but has certainly lost importance.

The mode, in the second place, by which the royal power has been diminished has been the increasing development given to the system of Cabinet government. The Cabinet, as Bagehot has established, is in reality the mainspring of the machinery of the English Constitution. A body not known to the law, and which is in fact a committee virtually elected—or rather selected—by the Houses of Parliament, and mainly by the House of Commons, from among their number, has become the real English Executive. As the result of a series of something like accidents, this body has in reality, though not in name, the means of appealing from any decision of the Houses of Parliament to the nation. Whoever wishes to determine where it is that supreme power in fact resides, under the complicated and misleading forms of the Constitution, must try to ascertain who are the persons who can in the last resort appoint the Cabinet. Under the Georgian Constitution, the appointment lay in effect partly with the King, partly with the two Houses of Parliament. The Crown's choice was no doubt limited: there were moments when the Crown had no choice at all. But, speaking generally, George III. and his sons could exert very great influence over the constitution of the Ministry; they could often exert decisive influence on the answer to the vital question, who should be Premier. They could, at lowest, all but veto the admission of certain persons to the precincts of the Cabinet. It was no mere form by which Ministers were treated as the King's Ministry. When Lord Eldon constantly writes and talks of George III. as "my old master," when George terms Eldon "my" Lord Chancellor, the words used have a real meaning. Before 1860 a great change had come over the working of the Constitution: every one knew and felt that in substance the Cabinet was chosen by Parliament. Oddly enough, it was the Conservatives of the day who first made this apparent. That Lord Melbourne retained office, owing to the favor of the Queen, longer than he could otherwise have done, is certain; but the result of the contest between Peel and the Whigs was decisive. No Premier will ever again rely on royal influence to keep him in power when he has virtually if not in name lost the support of Parliament. Authors such as Professor Yonge may still write as though it were an act of impertinence or impropriety for a party to force on the Crown the choice of a particular Premier. Every Englishman not blinded by formulas knows that the true impropriety would be for the Crown to refuse the Premiership to the real head of a Parliamentary majority. The question as to the choice of Ministers, which in truth still remains undecided, is not, What are the respective powers of Crown and Parliament? but whether it is in reality to be Parliament or the constituencies who appoint the Premier. Could any House of Commons have refused two years ago to support Mr. Gladstone's claim to be Prime Minister?

For, in the third place, the formal and mechanical changes in the Constitution and its working between 1760 and 1860, not to speak of the immense alterations which have been introduced since the last date, were clearly little else than the signs of a radical alteration in the relation between Parliament and the nation. During the whole reign of George III. the received doctrine of Whigs, even more distinctly than of Tories, was the sovereignty of Parliament. The electors, who formed a very limited part of the nation, had the right of electing members, but the members of the House of Commons were not, according to the orthodox Whig creed, in any sense the representatives of their constituents: they were a portion, and the most important portion, of the sovereign power. The policy of Fox at every stage of his political career, the language of Burke, the conduct of the House of Commons, both in expelling Wilkes and in supporting the war with the colonists of America, can be understood only by students who keep in mind the prevalence of the belief in Parliamentary supremacy. Chatham differed from all the statesmen of his time by realizing the fact that the nation was the ultimate authority in national affairs, and the policy of Chatham was at bottom almost as opposed to the theories of the regular Whig leaders as to the prejudices of the King. Every Englishman of sense now feels, almost without the necessity for reflection, that the absolute sovereignty of Parliament as opposed to the will of the nation is as obsolete a dogma as the belief in the divine right of kings. The general faith in Parliamentary sovereignty was, it should be noticed, greatly shaken long before the passing of the Reform Act. The career of men such as Brougham and O'Connell marks the growth of that kind of popular agitation which aimed at controlling the action of Parliament by the force of public opinion. The repeal of the Test and Corporation Acts, Catholic Emancipation, the Reform Act itself, were carried by an appeal to forces scarcely represented in Parliament.

Changes of political belief are almost always the results of changed circumstances. In the earlier years of George III.'s reign Parliament was supreme, because the aristocracy and that portion of the mercantile classes which were represented in Parliament really contained in themselves the strength and power of the nation. Nothing, as Maurice has with great acuteness pointed out, shows more strikingly how great was the social revolution which took place in England within a period of about fifty years, than the difference between Pitt's scheme of Parliamentary reform and the Reform Act actually carried by Lord Grey. Pitt's proposals aimed at increasing the influence of the counties. The independent landowners were in his day the sound part of the Constitution. They, it was thought, might be trusted to resist both the encroachments of the Crown and the growth of corruption. The aim and effect of Lord Grey's Act were to give predominant influence to the large towns and to the trading and mercantile classes. The contrast between the two policies affords no just ground for censuring either Pitt or Grey. Each statesman tried to legislate, as every practical politician must legislate, with a view to the circumstances of his time. That each of them adopted a different method of reform shows that each had an eye for existing facts. In 1782 the landowners were still the predominant power in English politics; in 1832 the growth of manufactures, the prodigious extension of trade, the rise of the great northern towns, had changed the balance of power. The need of the time was to recognize the predominance of the mercantile and trading interests. The pacific revolution which the Whig statesmen carried out under the name of the Reform Act was neither more nor less than the transference of ultimate authority in the state from the aristocracy and the landowners to the traders and the middle classes. The Georgian Constitution as it existed from 1760 to the death of George IV. was an aristocratic system of government, in which the power of the nobility was restrained by the authority of the Crown and the growing power of the middle classes. The Constitution as it existed from the time of the first Reform Act till 1868 was, in the main, a system of middle-class government, in which the predominant power of the middle classes was restrained on the one hand by the influence of the aristocracy, and on the other by the growing power of the democracy as represented by the artisans of the large towns.

THE PRIVATE CORRESPONDENCE OF BERLIOZ.

Hector Berlioz: Lettres Intimes. Avec une préface par Charles Gounod. Paris: Calmann Lévy; New York: F. W. Christern. 1882.

Few composers have left their admirers such abundant material for estimating their character, aims, and convictions as Berlioz. To his 'Mémoires,' which were published during his lifetime (with some necessary omissions), was added, three years ago, a volume of 'Correspondance Inédite,' containing a large number of his letters to his son and his friends, among whom Liszt, Bülow, Glinka, Legouvé, Fétis, Hiller, Horace Vernet, and Schumann may be named. And now the same publisher has issued a new collection containing 141 letters to one of his most devoted friends, Humbert Ferrand, dating from 1825 to 1867. The preface, by Charles Gounod, is mostly concerned with a discussion of the well-worn theme of the relations between genius, fatherland, and popularity. One sentence deserves citation: "Happiness does not lie in the absence of suffering any more than genius lies in the absence of defects." Gounod was personally acquainted with Berlioz, who

was fifteen years older than himself, and he tells how he used to hurry from his lessons with Halévy at the Conservatoire to the concert hall, to enjoy "this strange, impassioned, convulsive music, which opened to my vision horizons so new and so full of color." One day he attended a rehearsal of "Romeo and Juliet" before it had appeared in print. A few days later he went to see Berlioz, and played on his piano the passage "Jurez tous" from the finale. "Where the devil did you learn that?" asked Berlioz. "At one of your rehearsals," was the answer; and Berlioz could hardly believe his ears.

That Berlioz's character was as "strange, impassioned, and convulsive" as his music, is proved on every page of this correspondence. "With Berlioz," says Gounod, "all impressions, all sensations take on an extreme form: he does not know joy or sadness except in a state of delirium; as he says himself, he is a 'volcano.'" "How unhappily I am organized!" says Berlioz in one of these letters—"a true barometer: now high, now low, according to the variations, brilliant or sombre, of my consuming thoughts." In another place he says that his life is a romance which greatly interests him: "one day at ease, calm, poetic, dreamy; another day nervous, bored, a mangy dog, grumbling, vicious as a thousand devils, disgusted with life, and ready to put an end to it," were it not for his friends, for music, and *curiosity*. A person of such a disposition absolutely needs a friend to whom he can confide his joys and sorrows; and the fact that Ferrand was such a friend lends the principal charm to these letters, of which evidently not one was written with the faintest idea of the possibility of its ever being published. They are all concerned with Berlioz himself, the ego being only occasionally displaced by the name of his wife, his son, or some famous artist or manager with whom he came in contact, and only in so far as he did come in contact with him.

As Ferrand supplied the poems to some of Berlioz's compositions, there was all the less reason in speaking of them for reserving his inmost convictions, since he could allude to them as "our works." In a letter dated January, 1867, two years before his death, he makes the interesting statement that if all his compositions were doomed to be burned except one, he would select the "Messe des Morts" for preservation. He actually did burn some of his works—an overture to "Rob Roy," a *messe solennelle*, and three or four inferior numbers in the opera "Francs Juges." "But," he adds, "when I tell you that this score has all the qualities which give life to works of art, you can believe me, and I am sure that you do believe me. 'Benvenuto' is such a score." The overture "Francs Juges," at its first performance, produced "a stupendous and terrible effect, difficult to describe." Forgetting that it was by himself, he felt inclined to exclaim, "How monstrous, colossal, horrible!" At the first performance of "Romeo and Juliet" at Baden, he tells us that the *adagio* was the cause of many tears, and that nothing enchants him more than to arouse such an emotion by means of music alone. The great agitation into which his own music plunged him, sometimes prevented him from conducting with the necessary composure, and he mentions a case where his constitutional neuralgic pains did him a good service by neutralizing this emotion and enabling him to conduct better than usual. That he was rated as a good conductor, and not only of his own music, is known from various sources, and is indirectly evidenced by the account he gives on page 226 of a quarrel he had with a Ministre d'État because he (Berlioz) would not conduct the performances of Gluck's "Alceste" at the Opéra. He knew that certain passages had been altered and transposed to suit the voice of Mme. Viardot, and he would rather risk the refusal of his beloved "Trojens" at the Opéra than assist in producing in a mutilated form a work of Gluck's, whom he worshipped hardly less than Beethoven and Shakspere.

In this matter, indeed, he was more conscientious than in his capacity as critic, in which the position of the papers for which he wrote often compelled him to deal gently with works he would have rather torn to pieces. Before he obtained his post as regular critic of the *Journal des Débats* he "worked like a nigger" for several less prominent papers—as many as four at a time—and in 1834 he complains of having to write "d——d feuilleton articles for a hundred sous apiece." His neuralgic pains were sometimes so severe that he had to devote three or four days to a single article. It is characteristic that some of the first articles he mentions were attacks on Italian music. The editor found that he was "a little hard (*un peu dur*) on the Italian school." Bellini he alludes to in one of the letters as a "petit polisson," and Cherubini as an "illustre vieillard." Of Rossini he says on page 40: "I had an offer to be introduced to him, but I did not accept, as you can well imagine. I do not love this Figaro, or rather I hate him more every day. His absurd jokes on Weber in the foyer of the German theatre exasperated me; I regretted not to have been present at the conversation to box his ears." Curiously enough, he was on good terms with Spontini, whose operas he greatly admired, and with that king of old fogies, Fétis, who wrote, in the *Revue Musicale*, "two superb articles" on Berlioz, and who said to a person who remarked that Berlioz had the devil in his body, "Faith, if he has the devil in his body, he has a god in his head." The devil, it will be noticed, plays a great rôle in Berlioz's correspondence.

Allusions are made in several of the letters (July, 1861, and October, 1867) to offers he had received to go to America, or, as he says in the first letter, "les États-*Désunis*." In the second instance, he was offered, for six months in New York, a hundred thousand francs. He refused, because, he says, his desire for money was not great enough to overcome his antipathy to this grand nation and its utilitarian habits. It should be stated that Berlioz was, unlike Beethoven, a monarchist, or imperialist. He seldom alludes to political matters, and begs his friend to avoid them also; but in a letter dated January 2, 1855, he says: "Je n'oublierai jamais que notre empereur nous a délivrés de la sale et stupide république! Tous les hommes civilisés doivent s'en souvenir. Il a le malheur d'être un barbare en fait d'art; mais quoi! c'est un barbare sauveur—et Néron était un artiste."

In view of Adelina Patti's recent departure from this country, one more short extract will be of interest. Berlioz heard her in 1864 in "Martha," "that insipid (*plat*) opera [which] is played in all languages, in all theatres of the world." He calls her the "ravissante petite Patti," and adds that he sent her word that he pardoned her for having made him listen to such platitudes, but that he could do no more than that. "Fortunately there is in this opera the delicious Irish air, 'The Last Rose of Summer,' which she sings with a poetic simplicity that would almost suffice, with its sweet perfume, to disinfect the rest of the score." This was almost twenty years ago, and Mme. Patti still sings the same delicious Irish melody and the same platitudes.

SCIO AND CREDO.

Die Entstehung der physichen und geistigen Welt aus dem Aether. Von Jos. Schlesinger, Ord. Prof. der Geometrie an der k.k. Hochschule für Bodencultur in Wien. 1882. Pp. 97.

Die Religion des Gewissens als Zukunftsideal. Von Dr. Alex. Wernicke. Berlin, 1880. Pp. 127.

Geist und Stoff. Erörterungen und Betrachtungen über die Souveränität der Materie. Von J. Ludewig. Iserlohn, 1881. Pp. 244.

The Philosophy of Self-Consciousness; containing an Analysis of Reason and the Rationale of Love. By P. F. Fitzgerald. London: Trübner & Co. 1882. Pp. 196.

Evenings with the Skeptics; or, Free Discussions on Free-Thinkers. By John Owen, Rector of East Anstey, Devon. London: Longmans; New York: J. W. Bouton. 1881. 2 vols. Pp. 464 and 516.

The Creed of Science, Religious, Moral, and Social. By Wm. Graham, A.M. London: Kegan Paul & Co. 1881. Pp. 412.

Some thirty-five years ago half a dozen young German students and teachers of science, who used to meet for discussion in a select *Kneipe*, had all concluded that the ultimate explanation of the universe must be mechanical. All knew that, from many considerations, obvious enough in Germany, such views must at least long remain esoteric; indeed, so strongly were university influences opposed to such opinions that, after the little band was scattered among the various universities, where each member has since become eminent, they were not even made subjects of correspondence. When individuals met in later years these views were always referred to, and great satisfaction, and indeed for a time enthusiasm, was felt that all, save Lotze alone, had remained true to the faith in mechanism. "But of late years," said the venerable professor who narrated the incident to the writer, "nearly all of us have come to see that there must be something else, while the Social-Democrats have made us feel that something else is needed for social order." The reaction against materialism is no doubt widespread and general. But the reaction against extreme idealism and liberal Christianity is at the very least no less so. As "straws," let us glance at a few of the latest and ablest books, chosen purely at random from a vast body of similar literature.

The uncritical etherism of Spiller, elaborated in several volumes, which regarded the cosmos as a kinetic organization of ether, attracted little attention. In 1878 B. Trost attempted a quasi-scientific application of the hypothesis to light; the next year E. Reich attempted to apply it to anthropology and psychology; and at last Prof. Schlesinger urges that the soul must at least be regarded as a mass of accumulated force, and that to assume that it can vanish without trace at death, as materialism implies, is contrary to the law of the persistence of force. As opposed to the ponderable body, the imponderable, ethereal soul-organization gathers in more force than it expends. Atoms may be constituted of homogeneous *œtoms*, and may be really æther cells of peculiar constitution. Death is only the separation of the ponderable from the imponderable soul. The latter is the conscious ego, and is immortal. This culmination of etherism is very far indeed from being science, but it shows one psychological drift, and suggests a possibility.

Dr. Wernicke argues that the foundation for the religion of the future was laid by Kant. The voice of conscience is the voice of the immanent God, calling on us to destroy the transcendental idols of himself which men have made.

The consummation to which the protestant principle must look forward is a vital but confessionless religion, and a subjective but most real deity, of whom the moral law is the only revelation. Unlike Schopenhauer's will, all the echoes of the vast and mysterious past from which we sprang are heard, and the aggregate or resultant impulses are felt in conscience. The great task of religious teachers is how to formulate rightly its vague and often inarticulate promptings, although, so far as the central doctrine of love for our fellow-men is concerned, little advance can yet be made beyond what Jesus did.

J. Ludewig reviews the current theories of nebulæ atoms, spontaneous generation, language, the senses and brain, etc., to show that it is not needful to explain the world without transcendental reference, but that, on the contrary, there is ample room in the boundless fields left untenanted by agnosticism for a purposive and independent power above physical nature and outside the brain. But room is not proof, and the chief element of the latter is psychological, and is found in the impulse toward perfection and in the instinctive and irrepressible belief in something above matter, which, however, cannot be fully defined or proved by the intellect. At certain stages of development belief in a future life is also indispensable to good morals. Genesis is a poetic fiction, but is yet almost startlingly in accord with geology. The miracles, and very likely future punishment, must be given up; but the conception of God as a father, of the sanctity and dignity of labor, of universal fraternity, are the essentials of Christianity, are not in conflict with science, and are neither agnostic nor dogmatic, but are a social and personal need.

According to Mr. Fitzgerald, God is involved in our self-consciousness; otherwise his existence must be for us unnecessary and contingent. Scepticism is thus due to want of a clear conception of what the typical process of thought really is. Language cannot tell us, for it originates in metaphors of sense, and thought many assume to be radically different. Indeed, despite Hegel's dictum that philosophic self-consciousness is the chief end not only of man, but of the universe, there is nothing we know so little about directly as thought. To attain this notion of generic thought, or of a normal as opposed to an isolated ego, induction must be applied to a wide range of literature and history. By this "method of quotation" the author is led to the three "discoveries" or "novelties" which constitute his book: (1) The substance of reason is being. Our power of realizing the necessary inferences involved in the facts of feeling, thought, and will measures the quantum of our being. Confidence in reason is "faith in the intrinsic power of reason" as the basis of ideation. (2) Imperfection is a cause not of pain, but of the chief joy of life, for it makes love possible, which is the key to duty to both God and man, and is essentially correlative. Love is in no sense self-sacrifice, but self-realization. Only divine love can raise marriage above the plane of selfishness *à deux*, with its sense of depressed vitality and loneliness, and make men feel "strong, beautiful, and free." (3) Morality is action according to our rational nature, revealed in introspection as "social and divine self-love," and is measured by the amount of happiness which comes from realization of the ideals of feeling, thought, and will.

Mr. Owen's very able and interesting discussion of scepticism, from Xenophanes to Agrippa, is an attempt to introduce a psychological basis into the history of philosophy. Etymologically, the sceptic is not a denier, but only an inquirer or searcher: he is analytic, dynamic, suspensive, has inaugurated every advance, is never opposed to Christianity, but always to undue ecclesiastical development; suspects all finalities and infallibility, and derides only the presumption and self-complacency of dogmatists. He is, in short, the true philosopher, who loves the truth for its own sake, does not teach it as an hierophant watching over and doling out sacred and esoteric lore with needless pedantic technicalities, but in a way to quicken truthful and ingenuous expression. Scepticism is as diverse as belief, and seems germane to the "storm-and-stress" period of life. The lower races and minds never feel the impulse to analyze the stock of ready-made ideas and habits; but the better the mind the more uncertainty, and the fuller of embarrassment and contradiction does the universe appear. If a man loves freedom, desires to live in his own philosophical house rather than in one planned by another, and takes the first momentous step toward incredulity of his creed (which is held to the more tenaciously the narrower it is), he begins a task the completion of which is one of the greatest labors of man. Between the feeling that he knows nothing (the most disquieting of insights) and the conviction that he *can* know nothing (the most satisfying philosophic *ataraxy*) a life of struggle and study may well be spent. In this broad spirit the essays and conversations between persons representing typical standpoints are carried on in a way which suggests Plato, Berkeley, and Mallock by turns, and in a style so agreeable that few who begin the volumes will leave them unfinished.

The ablest and most original book on our list is Mr. Graham's. Respecting the nebular hypothesis, such fundamental contradictions are found that it is concluded that at present "we know nothing for certain" respecting the origin of the earth or the heavenly bodies. As to the origin of life, it could not have been from another planet by aerolite transportation, nor by creative fiat from nothing conceivable by us. Nor can all matter be regarded as "in a certain sense alive," as Haeckel says. Despite the failures of observers, spontaneous generation must be regarded as probable, and even Shakspere may have been "potential in a fiery cloud." Personality and consciousness in the Deity are surrendered as implying limitation and anthropomorphism, but a vigorous stand is made for purpose as opposed to chance in the universe. God is ultimate reality, and cannot be represented in consciousness any more than the latter can be in terms of plant function. In choosing between personality and consciousness and the countless possible modes of being which are higher and inaccessible to our faculties, we must choose the latter for both deity and our own future life. The old conception of the soul as simple, indivisible, and entirely dissimilar to the body must be abandoned. Memory does end with death, but annihilation is unknown in nature, and we cannot escape something at least as important and significant as continued consciousness, if that must be abandoned. We can now do little, if anything whatever, to benefit our chances of the best in the hereafter. Ethics, the culmination of all human science, is yet to be written. The moralists of the past had an imperfect knowledge of man. Human life could not be run a day on existing ethical systems. Yet from the joint report of the several sciences now since Darwinism (as important an advance in our knowledge of man's true place in nature as was made three hundred years ago respecting the position of the earth among the heavenly bodies), it may be inferred what we can know and hope, and should, and perhaps can, do. The only error in this view of man, it is said, is that it leaves no place for great men who have enlarged human nature by revealing new fields of thought, finding a new language for the soul in art, wrought out many ways of moral salvation, and made our culture and civilization.

In our brief space only very inadequate characterization can of course be made. Each of the writers cited is intelligent, thoughtful, and well read, to say the least; approaches his theme from a different direction, and appears to cast an independent vote. Each surrenders much dogma that many still think essential, but each makes concessions which most scientific men are far more willing to grant now than they were ten years ago. Each pleads for more, not less religion, and for a more, not less critical and radical science. All, too, plead for the third and higher monism above the old antithesis of idealism and materialism, refer to psychological proofs as final, and to moral needs as imperative and regulative, urge the need of some kind of purpose at the bottom of the universe, and hold belief to be as great a psychic and a greater moral necessity than knowledge. None of these volumes, save the first and least suggestive, is the work of a specialist, and the candid reader feels no special bias. May we not therefore infer (so far as our method of random selection shows anything at all on so small a basis), that the true and often postulated unity between science and religion, when it emerges, is not to be a sorry syncretism nor a compromise, as we are often told by those whose profession it is to lecture upon this subject, but a union, vital and quickening to both alike, the vague and general character of which those who are open to the influences which are now so rapidly recasting our near intellectual future can already dimly discern?

GENERAL GORDON'S DIARY.

A War Diary of Events in the War of the Great Rebellion, 1863–1865. By George H. Gordon, late Colonel 2d Mass. Infantry, Brigadier-General, etc. Boston: Jas. R. Osgood & Co. Crown 8vo, pp. 437.

General Gordon's book purports to be the substance of a diary kept by him during the latter half of the late war, and is part of a series of books intended to cover the writer's experience in the whole of the great struggle. The volume has the merit, which all transcripts of actual experience and observation in such a time must have, of preserving for us authentic descriptions of scenes and narratives of events with the fulness of detail which cannot otherwise be secured. General Gordon's service, after the battle of Antietam in September, 1862, was not of a very exciting character. The occupation of the Virginia Peninsula and Norfolk during the campaigns of Chancellorsville and Gettysburg, some months' service upon the Sea Islands, near Charleston, a brief and insignificant campaign in Florida, a few weeks' service in the lower Mississippi Valley and on Mobile Bay, and a return to administrative duties at Norfolk during the closing months of the war, make up the sum of his duties and labors, of which the story is told in these pages.

The narrative has an interest of its own which is due to the fact that it deals with out-of-the-way places and scenes, and with phases of experience somewhat different from the life of a soldier in important campaigns. The author was brought into constant contact with the women and the old men of the Southern States, whose homes were within the advancing lines of our armies. He had to deal with the freedmen, whose new-found liberty was a thing its possessors did not know how to use. The trade in cotton, under permits from the Government, with all its frauds and demoralization, came more or less under his eye and his jurisdic-

tion, and finally it fell to his lot to investigate the illicit and contraband trade with the enemy through the lines at Norfolk, which was the scandal of Butler's administration of the Department of the James.

Here is no lack of interesting historical matter, and we should be grateful that such a record has been preserved. If we could have chosen, we would have omitted some rather turgid comments on the situation from time to time, for they diminish the strength of the picture. In the long conversations with rebellious men and women, the General often figures in the rôle of a prolix lecturer on the duty of loyalty and the enormity of the rebellion, and must have been sadly tedious to the unwilling listeners. With all our sympathy with his sentiments, we could have spared most of the iteration without finding the volume less attractive. But we have hardly the right to be choosers, and these blemishes only diminish our thankfulness; they do not overbalance the merits of the book.

In another respect, however, the volume calls for severer criticism. More than a hundred pages are devoted to the operations of General Gillmore in the Coast Department of South Carolina, and from beginning to end this part of the diary is full of contemptuous sneering at the commanding officer. It was so manifestly written under the influence of a rooted personal ill-will as to lose most of the effect it would otherwise have as a hostile criticism of Gillmore's operations before Charleston, by one of his subordinates. Had the author given us a clear, military examination of Gillmore's plans and operations, pointing out their defects and showing what ought to have been done in order to accomplish the purposes for which an army was sent to the Sea Islands, we should at least have been instructed by intelligent criticism made by a military man on the spot. What we have is not military criticism; it is the daily expression of petulant dislike which carps so constantly as to provoke reaction in the reader's mind in favor of the object of it. Perhaps General Gillmore ought to have foreseen that when the pounding of his hundred-pound shot and shell had beaten the walls of Sumter into a sloping earthwork, the fort would be as strong as ever. It is easy to sneer at such ignorance after the fact; but that very bombardment was an important step in the education of the whole world regarding the problem of attack and defence of fortifications. We already knew something of the resisting power of earthen parapets, but we did not know that casemated structures of two or three tiers could be transformed into earthworks while the garrison held the fort, and saved themselves from great loss, by repairs with sand-bags which kept pace with the demolition of the masonry.

Gillmore is jeered at again because the Confederates evacuated Forts Wagner and Gregg when the sap had nearly reached the ditch of Wagner. Since it was the object of the siege operations to gain possession of those forts as commanding points upon the Bay of Charleston, it would seem to be matter of congratulation that this was done without the cost of a bloody assault. To have carried Wagner would not necessarily, or even probably, have captured the garrison, which could have retired to Fort Gregg, and from there have retired again by water. Still, again, the unfortunate affair of General Seymour at Olustee, in Florida, is laid at Gillmore's door, though he was at Hilton Head. If anything is plain, it is that the causes of that misfortune were on the field of battle, not at department headquarters. Yet Seymour is praised as a brave and skilful officer, while Gillmore, though far away, is saddled with the blame.

It may be that the author's implied judgment of Gillmore is just; but the point now made is that the book before us gives no means of forming a judgment. It is an expression of depreciatory opinions, without a summing up of facts supporting them. This is usually called abuse, not criticism, and a military writer should hold himself bound to give intelligible proofs of bad generalship, and not ask his readers to accept his condemnation of a commander because he reiterates his own dislike or ill-will. The publication of a diary after the death of the writer may be proper when the same publication by the writer himself may not be. In the one case we read with the understanding that we must take opinions recorded at the moment with many grains of allowance; but when a writer prints his own diary he is bound to omit personal disparagement, unless he accompanies it with such fuller marshalling of facts and argument as shall make it evident that he is trying to rise to the level of historical judgment. It is to be regretted that General Gordon does not seem to have appreciated this distinction. Had his book contained a little less or a little more, it would be worthier a place in the permanent historical memoirs of the time. Its descriptions are usually lively, often quite vivid, and its abundant stores of incident and anecdote make it easy and entertaining reading.

The Fables of La Fontaine. Translated from the French by Elizur Wright. A new edition, with notes, by J. W. M. Gibbs. London: George Bell & Sons. 1882.

La Fontaine and Other French Fabulists. By the Rev. W. Lucas Collins, A.M. Philadelphia: J. B. Lippincott & Co.

Some weeks ago we reviewed a work by Mr. Elizur Wright (the Life of Myron Holley), composed in his seventy-seventh year, and now we receive from across the water, as an addition to Bohn's Standard Library, his earliest literary performance, first published in his thirty-seventh year. Mr. Wright's complete version of the Fables of La Fontaine appeared in 1841 in an elegant form, thanks to a generous body of subscribers, and was followed by a cheap and popular impression, now rarely to be met with, which ran out in a sixth and expurgated edition. It cannot be said, therefore, that in this case the prophet was without honor in his own country, yet no American publisher has thought it worth while to revive what still remains, as Mr. Gibbs says, the best English version of the French classic, even when compared with the late Mr. Thornbury's, made to accompany Doré's illustrations. The present editor has not only given Mr. Wright's work a beautiful typographical dress, restoring the full text, but has prefixed an interesting account of Mr. Wright himself, including some of the latter's original fables, which establish his title to be a translator in the same vein, and has added judicious explanatory foot notes. We will only remark further on this head that, but for our absurd protective system, the translator's countrymen might now enjoy, at a low price, the fruits of the well-deserved honor thus bestowed upon him abroad.

Singularly enough, the Rev. Lucas Collins makes not the remotest allusion to attempts to place La Fontaine before English readers. His agreeable little book—one of Mrs. Oliphant's "Foreign Classics" series—is interspersed with metrical translations, both from La Fontaine and from the other fabulists treated of. They are possibly, though quoted, his own composition, and at all events exhibit the poetic facility which usually attends a certain degree of cultivation. They would be called more elegant than Mr. Wright's, but they cannot have cost one-half the labor, and much of their smoothness they owe to liberties with the French which Mr. Wright seldom allows himself. In general, they lack the terseness and pungency which are the reward of successful adherence to the model; and if, once in a while, the Englishman hits the mark better than the American, he oftener misses when he does not purposely avoid it. Take, for instance, the energetic verse in the "Animaux malades de la peste":

"Ils ne mouraient pas tous, mais tous étaient frappés."

Mr. Wright straightforwardly renders it thus:

"They died not all, but all were sick";

while Mr. Collins gives this sapless equivalent:

"Death day by day to some, sore pains to all."

Still, there is some profit to be derived from contrasting the versions which are common to these two volumes, though Mr. Collins is far from such verbal felicities as Mr. Wright's "Rat-United-States" (*peuple rat*), and the like. And if forty years have not done much to increase the number of La Fontaine's English translators, neither have they greatly enlarged the material for his biography. There is very little in Mr. Collins's sketch which is not to be found in Mr. Wright's.

Paris Herself Again in 1878-79. By George Augustus Sala. 350 illustrations. Sixth edition. London: Vizetelly & Co.; New York: Scribner & Welford. 1882. 12mo, pp. xviii.-539.

Mr. Sala spent four months in Paris during the latest Universal Exhibition, and wrote for the *Daily Telegraph* the letters which, profusely illustrated by Cham, Bertall, Lalanne, and other French artists, form the substance of this lively book. We all know Mr. Sala's style—the rapid, inconsequent, and yet entertaining way in which his thoughts may be said to tumble over each other. We have all been amused by his manner in treating light subjects, and distracted by it when he attempts to write seriously, as in his extraordinary essay on "The Genius of Charles Lamb," prefixed to a part of the Moxon 12mo edition, but soon replaced by a paper from another hand. Fortunate, by the way, is the possessor of that curious essay. Its title is "On the Genius of Charles Lamb"; but while it contains something upon nearly every other topic in literature, there is nothing in it about the genius of Lamb. These and other of Mr. Sala's literary peccadilloes have had their reproof in certain quarters, as we learn from his own very frank confessions in the preface to the second edition of the present work, which seems to have been accepted as a sort of propitiation:

"The *Times*, which was good enough to review a book of mine called 'A Journey Due North,' published twenty years ago, but which subsequently sank into stony silence concerning my writings, gave a graceful notice to 'Paris Herself Again.' So did the *Athenæum*. . . . The *Saturday Review* went out of its way, so it seemed to me, to be appreciative and complimentary. What has become of my enemies? . . . It is a matter of great joy to me to find from the welcome this book has received, not only from the public, but from the reviewers, that at least I have not been making enemies since my last work was published."

There is reason for this book's success in its fitness of style to the subject. The surface of Paris—the Paris of the boulevard, restaurant, and theatre, the shows of the great Exhibition—these are the natural topics of the rambling newspaper-letter, and Mr. Sala is an accomplished and very rambling newspaper-letter-writer. Of all writers he is the one who can best whip up the froth of an egg. But, if there is little enough substance in his writing, it is excellent in its way: one feels that this book is to be read purely and wholly for amusement, and without the slightest thought of edifica-

tion. The chapter on "Dinner-Time in Paris" will illustrate this studied superficiality; by a negative description of Mr. Sala's style, it may be called the least Carlylese of any conceivable writing upon French topics. But all styles have their function, and Mr. Sala deserves credit for having plied his "trade as a journalist," as he calls it, to such amusing purpose as the present, as also do the collaborating artists whose work has been utilized for this book. Mr. Sala has now described three Paris exhibitions, and, considering his age, there is a reasonable prospect of his describing for us a fourth "Universal Exposition" from the *flâneur's* point of view.

A Lady's Cruise in a French Man-of-War. By C. F. Gordon Cumming. 2 vols. 8vo. Map and illustrations. Edinburgh: Blackwood. 1882.

THE readers of 'At Home in Fiji' will remember that at the close of Miss Gordon Cumming's two years' residence in Fiji, the *Seignelay*, carrying the Roman Catholic Bishop of Samoa on a pastoral tour through his diocese, touched at the islands. A cordial invitation to join this missionary party was accepted, and these volumes are an account of the cruise, together with a five months' stay in Tahiti. Naturally much space is devoted to the French and English missionary establishments on the various islands visited, but there are also many graphic descriptions of scenery, and lively details of the life of the people. Much attention has been paid to the antiquities of the less-known places, both as preserved in the superstitions of the islanders and in the remains of the rock temples and tombs. Some of these latter are peculiarly interesting. The tombs of the old kings of Tonga "are formed of gigantic blocks of volcanic rock, said to have been brought to these flat isles from the Wallis group. They are laid in three courses of straight lines, like cyclopean walls, and lie at intervals through the bush." How and by what race these stones were transported some hundreds of miles across the sea is, we believe, still a mystery. The author gives a sketch of a huge trilithon on the same island, 15 feet high by 18 feet long and 12 feet wide, remarkable also from the fact that "the two supporting pillars are cut out at the top to secure the transverse capstone, which is hewn." Still more wonderful are the stone images on Easter Island, some of which "are 27 feet long, and measure 8 feet across the breast. . . . The statues are literally lying about in hundreds, and the very rocks on the sea-beach are carved into strange forms—tortoises or human faces."

The Samoans, at the time of Miss Gordon Cumming's visit (September, 1877), were engaged in an internecine war, chiefly the result of the intrigues of the notorious Colonel Steinberger and his faction. They have almost universally embraced Christianity, and their strict observance of Sunday is as noticeable as in Fiji. On this day "the belligerents, by common consent, abstain from fighting, and allow teachers and missionaries to pass freely in and out of their camps, holding religious services in which all join." Notwithstanding this, the custom of head-hunting, during war at least, seems to exist here, though in a somewhat different form from that once prevailing in Borneo. From Samoa the *Seignelay* proceeded to Tahiti. The inhabitants of this group of islands were found to be mourning, with a sincerity which cannot be doubted, the very recent death of their good Queen Pomare, who had reigned over them for more than forty years. The universal sorrow was shown by the wearing of black flowing robes, without flowers, and by the cutting off of the hair of the women. This cloud upon the light-hearted gayety for which the people of these beautiful islands are world-renowned, was partially lifted during the ceremonies attendant on the succession of Pomare V., the eldest son of the late Queen, to the throne. Miss Gordon Cumming accompanied the royal party in a tour of the principal islands to receive the homage of the chiefs and people of the various districts. The description of this "royal progress" is the most entertaining part of her book. Everywhere native feasts were spread, in the groves or in hastily-built arbors of vast extent, remarkable chiefly for the profusion of flowers and the exquisite taste shown in arranging them. The greatest attraction, however, proved to be the *himènes*, or choruses. These are somewhat of the nature of glees, the words being sung by a single voice.

"After one clause of solo, other voices strike in—here, there, everywhere—in harmonious chorus. It seems as if one section devoted themselves to pouring forth a rippling torrent of ra, ra, ra-ra-ra! while others burst into a flood of la, la, la-la-la! Some confine their care to sound a deep, booming bass, somewhat suggestive (to my appreciative Highland ear) of our own bagpipes. Here and there high falsetto notes strike in, varied from verse to verse, and then the choruses of la and ra come bubbling in liquid melody; while the voices of the principal singers now join in unison, now diverge as widely as it is possible for them to do, but all combine together to produce the quaintest, most melodious rippling glee that ever was heard."

The description of life in the Society Islands, where the cruise ended, is full of interest, but we have not space to dwell further upon this nor upon the scenery, unsurpassed in its loveliness. Notwithstanding some rather dull chapters, which have a faint suspicion of padding, we can heartily recommend this new book of travels, though its interest is hardly equal to that of its predecessor.

BOOKS OF THE WEEK.

NOW READY.

LIEUT.-COMMANDER GORRINGE'S WORK ON

Egyptian Obelisks.

Folio, printed from type, 176 pages of text, 52 full-page illustrations (inserted), of which 32 are artotypes.

This work, comprising eight chapters, gives the history of every Egyptian obelisk now known to exist, the methods employed in quarrying, transporting, and erecting them, and a complete description of the manner of their removal from Egypt in ancient and modern times.

CHAPTER I. Removal of the Alexandrian Obelisk, "Cleopatra's Needle," to New York.
" II. Archæology of the New York Obelisk.
" III. Removal of the Luxor Obelisk to Paris.
" IV. Removal of the Fallen Obelisk of Alexandria to London.
CHAPTER V. Re-erection of the Vatican Obelisk.
" VI. Records of all Egyptian Obelisks.
" VII. Notes on the Ancient Methods of Quarrying, Transporting, and Erecting Obelisks and other Massive Monoliths.
" VIII. Analysis of the Materials and Metals found with the Obelisk at Alexandria.

Edition positively limited to 1,500 copies. Price $15 per copy, bound in cloth, delivery free.

Address HENRY H. GORRINGE, 32 Waverley Place, New York.

UNMOUNTED PHOTOGRAPHS Of ANCIENT and MODERN WORKS of ART, embracing reproductions of famous original paintings, sculpture, architecture, etc. Price, cabinet size, $1 50 per doz. Will be happy to send, regularly as published, their

Clearance Catalogue of Library Duplicates, etc.,

Consisting of best English Editions of Recent Books in all departments of literature, at greatly reduced prices, to any address, post-free, on application.

A Magnificent Library

Of over 10,000 vols., the result of collections of the ...hest works, made between 1790 and 1850, is to be dis...posed of by private sale. There are many curious and rare books, some having been printed at the beginning of the seventeenth century. For catalogues, price 25 cents, etc., apply to

REID TAYLOR,
Park House, Montreal.

Engravings and Etchings.

Old and Modern. Fine framing. FREDERICK KEPPEL, 23 East Sixteenth Street (Union Square). Correspondence invited. Visitors always welcome.

The Portable Bookcase
(PATENTED)

In Ebony, Cherry, Black Walnut, or Ash. Solid and Permanent. No room where Books are used complete without it.

For descriptive circular and price-list, address the sole makers, LOCKWOOD, BROOKS & CO., 381 Washington St., Boston.

Wadsworth Bros. & Howland,
IMPORTERS AND DEALERS IN
ARTISTS' MATERIALS
And Architects' and Engineers' Supplies of every description,
84 WASHINGTON STREET, BOSTON.
☞ Catalogues free on application.

B. QUARITCH'S (London)

Catalogue of Works on Natural History, Physics, Mathematics, and other Sciences. 380 pages, cloth.

Can be had, on receipt of 40 cents, from

B. WESTERMANN & CO.,
838 Broadway, New York.

"The Geese of Gauderica."

"Their History, their Sense and Nonsense." By a Utah Goose. A good-natured, satirical allegory on the
UTAH SITUATION.

A 40-page pamphlet sent to any address for four 3-cent stamps; 15 copies, $1; 50 copies, $3. Address
"GAUDERICA," Box 672, Salt Lake City, Utah.

OXFORD, ENGLAND.
THE MITRE HOTEL.

This well-known hotel, established in the year 1400, is largely patronized by families and gentlemen visiting the University from all parts of the world.

Its superior accommodation and reasonable charges highly recommend it. Ladies' coffee-room. Billiards.

OLD POINT COMFORT, VIRGINIA.
THE HYGEIA HOTEL,

Situated 100 yards from Fort Monroe, open all the year. Equal to any hotel in the United States as a Winter Home or Seashore Resort. Send for pamphlet describing hygienic advantages, etc.

H. PHOEBUS, Proprietor.

OFFICE OF THE
Atlantic Mutual
INSURANCE COMPANY.

NEW YORK, January 25, 1882.

The Trustees, in conformity to the Charter of the Company, submit the following Statement of its affairs on the 31st December, 1881.

Premiums on Marine Risks from 1st January, 1881, to 31st December, 1881		$4,039,487 10
Premiums on Policies not marked off 1st January, 1881		1,587,534 47
Total Marine Premiums		$5,627,021 57
Premiums marked off from 1st January, 1881, to 31st December, 1881		$4,110,176 72
Losses paid during the same period	$1,775,882 80	
Returns of Premiums and Expenses	$924,227 02	

The Company has the following Assets, viz.:

United States and State of New York Stock, City, Bank, and other Stocks	$8,965,758 00
Loans, secured by Stocks and otherwise	1,729,500 00
Real Estate and Claims due the Company, estimated at	491,148 18
Premium Notes and Bills receivable	1,631,294 23
Cash in Bank	347,765 99
Amount	$13,165,466 40

Six per cent. interest on the outstanding certificates of profits will be paid to the holders thereof, or their legal representatives, on and after Tuesday, the seventh of February next.

The outstanding certificates of the issue of 1877 will be redeemed and paid to the holders thereof, or their legal representatives, on and after Tuesday, the seventh of February next, from which date all interest thereon will cease. The certificates to be produced at the time of payment and cancelled.

A dividend of forty per cent. is declared on the net earned premiums of the Company, for the year ending 31st December, 1881, for which certificates will be issued on and after Tuesday, the second of May next.

By order of the Board,
J. H. CHAPMAN, Secretary.

The Nation.

NEW YORK, THURSDAY, APRIL 20, 1882.

The Week.

THE New York banks gained $4,144,500 in surplus reserve during the last week. The domestic money market was very easy, as were also all the foreign money markets; no gold was shipped, and foreign exchange closed below the rates at which gold can be exported without loss. It is estimated that during the week American railroad securities to the value of $5,000,000 were shipped to Europe; the exports of merchandise continue to decrease, while the merchandise imports are increasing. At the Stock Exchange the notable features were the buoyancy of the market for the 4 and 4½ per cent. bonds of the Government, and the depression in the market for railroad stocks. United States 4 per cents were bought up to 121¼ and the 4½s to 116¼—these being the highest prices ever paid for them. It was said that Mr. W. H. Vanderbilt was selling railroad stocks and buying United States bonds, but this seems improbable. Many of the national banks hold as security for their note circulation the extended 6s and 5s, which are subject to early redemption; some of these banks have been buying the 4s and 4½s, but rather than pay the present high prices for them it is likely that many will give up the business of issuing notes. The depression in the market for railroad stocks was freshly started by renewed sales for the account of Vanderbilt and Gould, who were quickly fol lowed in selling by the entire bearish fraternity of the "Street." Prices fell 1@8 points during the week, and the leading stocks sold at the lowest figures of the year. Railroad earnings, according to the published reports, show a gain in most cases over last year, despite the admitted fact that the tonnage derived from the leading staples of the country is very small. The outlook for the crops up to this time is good; there is promise of unprecedentedly large immigration, and mercantile business is fairly satisfactory. The labor troubles, however, cannot be said to have decreased during the week.

The new Chinese Bill has passed the House by a heavy majority, the period of suspension being restricted to ten years and the registration and passport provisions being left out, to meet the President's objections. It probably will have but little actual effect in keeping down the number of Chinese in this country. Those who want to come will come in from Mexico and the British territory, and when once here there will be no means of expelling them. But they probably will not come in great numbers from any quarter, and as the white population on the Pacific Coast grows the Chinese scare will seem more and more absurd, and by the end of the ten years people will be ashamed of it, as they are of so many bygone scares about the negroes. It seems a pity that the bill, after giving so much trouble, should not be likely to help one side more than the other in the next Presidential election, but it looks now as if neither had got any special advantage out of it for that region. It certainly leaves the Republican party worse off on the Atlantic Coast, for it makes sad havoc of certain ideas about the equality of men and the might of the National Government which did good service during the reconstruction period.

The President has decided, on the opinion of the Attorney-General, that he has no power under the law to do what he has been asked to do—nominate General Fitz-John Porter to the Senate for restoration to his old rank in the Army. We have no doubt that this decision is legally sound. The proper redress for whatever wrong General Fitz-John Porter has suffered can only be provided by legislation. The President can pardon him, but all that a pardon would do for him would be to relieve him from the incapacity under which he labors for holding office under the United States. It ought not to be supposed, however, that this decision of the President in any way affirms or even touches the findings of the court-martial. This is disingenuously assumed by some writers, to whom Fitz-John Porter's guilt is not, and never has been, a matter to be reasoned about. They believe in it as men believe in articles of religious faith, and always talk of the court-martial as if it was in some sense an inspired tribunal. The fact is that its decision has received a most thorough sifting by competent authority, and has been morally reversed; and anybody who goes on writing and talking, as many do, as if the Advisory Board had not passed upon the case, lays himself open to the suspicion either of great unscrupulousness or of great mental obtuseness. The court-martial was not an inspired body; it sat under as unfavorable conditions for the discovery of truth as ever attended any similar inquiry, and like hundreds of other courts-martial it did a wrong for which there ought to be some redress.

The tariff is generally considered a dry subject for popular discussion, and we may, therefore, regard the large, intelligent, and uncommonly attentive audience at the tariff-reform meeting on Friday night as an indication of a reviving interest in the tariff question. Mr. Vance highly entertained his hearers by his humorous treatment of the subject in its general aspects, while Professor Sumner very effectively struck at the principal stock-in-trade of protectionist demagogy—the pretence that protection is mainly benefiting "American labor"—by an excellent presentation of the real relations between the tariff and wages. What the speeches lacked in the specific discussion of the points now at issue in Congress was amply supplied by the resolutions. They point out the heavy burdens imposed upon the people by the protective system; the immediate duty of the Government to reduce taxation, which reduction should be mainly effected in those duties on imports which injure manufactures by enhancing the cost of raw material, oppress agriculture, and destroy our carrying trade and our foreign commerce generally; and the necessity of doing this without waiting for the report of a commission. The resolutions further demand an immediate reduction of the enormous and most hurtful duty on steel; they express approval of the proposition made by Mr. Hewitt in the House of Representatives, frequently mentioned in these columns; they demand relief for American shipping by the abolition of tonnage taxes, consular fees, and other needless burdens, and the adoption of the policy of "free ships" for the foreign trade; they recognize the difficulties surrounding revenue reform, and deprecate violent changes, while insisting that measures that can be safely taken should no longer be delayed. And finally Mr. David A. Wells and Mr. J. S. Moore are "requested to prepare a practical scheme for a revision of the tariff, based upon the customs receipts of 1881, which shall simplify and reduce the present rates of duties, and place on the free list all raw materials required for manufactures, so as to yield an ample revenue and to inflict no injury on American industries."

The Republican papers of Massachusetts are almost unanimous in disapproving the appointment of Mr. Worthington to the Boston Collectorship, but, the first shock being over, they discuss it rather philosophically. While most of them expect Messrs. Hoar and Dawes to oppose the confirmation of the appointment, they do not want the Senators to do so on the ground of Senatorial courtesy, but on the ground of the unfitness of the man appointed—he being a known reviler of the principles upon which the civil service should be conducted, and which have time and again been affirmed by the Republican party of Massachusetts. This is unquestionably the correct position. It is quite probable that Mr. Worthington will be confirmed in spite of all this, and that the Republicans of Massachusetts will take that very calmly too. The appointment is deplorable so far as it appears in the nature of a reactionary blow against the practical reform of the service, while well calculated to intensify the desire for reform among the people. The Stalwart leaders of Massachusetts, Messrs. Boutwell and Bowman, conspicuous for want of following, have persuaded the President to do a thing which cannot fail to injure him in public estimation, without any compensating political advantage. If this appointment was made with a view to political control locally, or as part of a system with a view to the control of the party at large, disappointment is inevitable.

Senator Mahone's plan for turning the Repudiation party of Virginia into an Administration party is not working smoothly. The first step proposed was the division of the State into districts in such a way that of ten Representatives eight should be chosen by the Anti-Bourbon-Readjuster-Administration combination. A bill for this purpose, however, was on Thursday defeated in the Legislature. The

next election will be held on the present district-basis, which will give the Democrats a better chance than they would have had under the bill, and the additional member will be elected by the State at large. This is largely the work of ex-Auditor Massey, who from an ardent friend of Mahone has recently been changed into a violent enemy, and who is said to have resolved either to be the tenth Representative himself or to turn the office over to the Democrats. But although a personal quarrel is the immediate cause of the defeat of the Readjuster leader, Massey had the support of two debt-paying Republicans, and the event has a broad significance. Senator Mahone has secured the Federal patronage in consideration of which he was to turn his repudiators into sound Administration men. Now that it is shown that he cannot deliver the goods for which he has been paid, it remains to be seen whether he can count on a continuance of Federal favors. So one-sided a bargain as this scarcely recommends itself to astute politicians, and an equivalent in some form will probably be exacted.

Mr. Craig, the City Marshal of St. Joseph, Mo., where Jesse James was killed, is in this city looking after a criminal, and has been interviewed about the robber's death. His view as to the probable and desirable outcome of the affair is somewhat peculiar, and we think open to criticism. He says that James's popularity in Ray, Clay, Jackson, and Johnson Counties was so great that it would not have surprised him if the story he heard on his way here of the Governor's assassination had been true. He gave it as his opinion that the Governor ought now to pardon the Ford boys, who slew James, and they in turn ought to be shot by their friends, and "the whole business wiped out." This seems to us a somewhat hasty utterance. Marshal Craig must know that the killing of the Ford boys by their friends would not end the matter in this way. In the James district of Missouri every man has two sets of friends, one who kill him and another who kill his killers. Consequently, if the Ford boys are killed, those who kill them will have to be killed, and consequently "the business" will not be wiped out. The simplest settlement would be to have the Ford boys kill each other, and if this can be arranged, we think it will do more for real estate in the counties above named than anything yet suggested. We were much touched by Mr. Craig's information that Mrs. James sent her little boy Charles Edward to the Presbyterian Sunday-school every Sunday, but we have been pained to learn that the reason the Fords killed Jesse was that they could not have arrested him, unarmed though he was, owing to the desperate defence which this lady would probably have made, with a double-barrelled shotgun, two pairs of pistols, and a Winchester rifle, which were "lying round the house." It seems to us that with such a mamma little Charles Edward needs Sunday-school more than once a week.

Everybody will be pleased to hear that Mr. James died poor after an active and much-respected career. Of course we do not mean to say that his career was much respected by everybody. Nobody's career is. The best and purest men have their carpers, cavillers, and detractors. What we mean to say is that Mr. James had the esteem and respect of a very large portion of his immediate neighbors, who are, after all, the best judges of a man's life. It is estimated that the proceeds of his robberies amounted to $263,778, an enormous business for one whose plant consisted of one or two horses and a knife and a pair of pistols, and now and then a rifle. If he had been the grasping, unscrupulous person which many have described him as being, a considerable portion of this would now be found among his assets. But so delicate has he been in meeting the claims of his partners, and so liberally has he provided for his little family, that his widow, we are informed, had only $200 in cash at the time of his death, besides the very plain furniture and pictures of his hired house. One of the most touching incidents of his murder was, indeed, the fact that he was standing on a chair engaged in dusting one of these pictures—the work of an American artist, by the way—when he was shot.

It is now proposed in Missouri to raise a testimonial for his widow, and it has already reached the sum of $300. The sheriff of the county will doubtless be glad to take charge of any contributions sent to him for her benefit. The total sum needed is not large. She is not a woman to be dependent on her friends, and has already received the offer of a handsome salary from a travelling circus for the summer months, which she will doubtless accept. She has one claim on the community which she urges with much force, and that is, that her late husband would not only have left off robbing and have lived quietly, but would "have been an honor to his country," if the police had let him alone; but they kept following him about, and thus interfered not only with his comfort, but with his usefulness. Mrs. James, however, has seen enough of life to know that nothing is more unfruitful as well as more painful than reflection on what might have been. We greatly fear that his assassination will cause more trouble in the beautiful region where he was known and loved. The *Daily Democrat* of Sedalia, Mo., has a very strong article on the manner of his death, in which it speaks with great severity of the unwillingness of some people in that section to have Mr. James keep a permanent residence among them. "It was his country," it says; "the graves of his kindred were there. He refused to be banished from his birthright, and when he was hunted he turned savagely about and hunted his hunters. Would to God he were alive to-day to make a righteous butchery of a few more of them." We have, however, no doubt that any butchery which may be called for in that locality will be done, in spite of Mr. James's untimely end, and our Sedalia contemporary must not take the matter too much to heart.

Speaker Keifer removed one Congressional stenographer, Mr. Hayes, "for cause," according to law, but declined to say what the cause was, and keeps it to this hour buried in his own breast. The new man, Mr. Dawson, would have been an excellent appointment but for his inability to report; an embarrassing fact which came out at the Shipherd investigation. Thereupon the Speaker began to remove for cause again, and everybody expected that he would remove Dawson for the greatest cause of all; but, instead of this, he removed Hayes's former colleague, Devine, also, like Hayes, an excellent reporter. The alleged cause here is that Devine had fomented discontent with Hayes's removal, and had shammed sickness in order to make the strain on Dawson all the more severe, and bring out his incompetency in a more startling manner In Devine's place the Speaker has appointed one Tyson, who is said to be a competent reporter, but then the Speaker evidently considers ability to report only a small part of a reporter's business, and consequently may any day remove Tyson for cause. Tyson was once Mr. Robeson's private secretary, and this was perhaps the cause of his appointment, and curiously enough would also be a capital cause for his dismissal. The necessity of producing cause has always hitherto been a serious impediment in the way of removal, and has been supposed to be a protection to efficiency; but this is because it has been supposed necessary to reveal what the cause was. Speaker Keifer's plan of keeping the cause secret, however, gets rid of all this, and would enable him to remove a man because the moon was at the full, or because he himself had been up late the previous night. The question of most interest to the public, however, is, What will be the effect of all this on the corps of Congressional reporters, which has hitherto been perhaps the most efficient in the world?

Shipherd testified before the committee on Thursday that he was told by Mr. Hurlbert, the editor of the *World*, that he (Hurlbert) had had in his possession one of Mr. Blaine's despatches to the other Hurlbut, of Peru, in which was written in pencil, as a marginal annotation, the words "Go it, Steve," meaning thereby that Steve was not to regard the text of the despatches, but was to do things which they apparently forbade his doing in or about the Peruvian complication. Now comes Mr. Hurlbert, of the *World*, and says that Shipherd is a "voluble impostor," and that he (Mr. Hurlbert) never informed him that "he had had in his possession a despatch sent, or intended to be sent," by Mr. Blaine to Steve. It will be observed that he does not deny that he ever saw the marginal annotation on a despatch, and many will be disposed to believe, therefore, that Mr. Hurlbert's testimony does not contradict Shipherd's. But it appears to us that it does, and that a conflict of veracity has therefore arisen and is now pending. All conflicts of veracity are painful and perplexing to the bystanders, but this one will be peculiarly so, owing to the prominent position before the public occupied by the two actors in it.

Mr. John F. Slater, of Norwich, Conn., has given two valuable hints to men who like himself are so fortunate as to be rich. One relates to the wisdom of themselves distributing money which they wish to set apart for benevolent uses. There is a double reason for

taking this course. They will enjoy the pleasure of seeing the results of their liberality, and they will make sure that the money will go where they intend it to go. If they leave it to be distributed after their death they cannot be perfectly sure that it will not be wasted in lawyers' fees or wholly diverted by a successful will contest. Mr. Slater resolved to avoid this contingency, or the fear of it, by acting as his own executor to the extent of a million of dollars. The other hint relates to the object of such contemporaneous benevolence. There are few ways in which the expenditure of money would do more good than in the education of the colored people of the South. Although a class is named in Mr. Slater's gift, its results are confined to no class. The freedmen, of course, ought to be educated for their own sake. The other people of the country owe them a peculiar obligation in this respect in view of their sudden and enforced elevation to a plane of rights and duties for which their previous state had not fitted them. But in educating the freedmen and making them good and intelligent citizens a service is done at the same time for the white people of the South, for the Southern States, for the whole Union.

The Lamson case, tragic as it is, is fast being surrounded by an atmosphere of comedy. Lamson and his friends made no proffer of any plea of insanity on the trial, and made no mention of any peculiar theory held by him as to the medical properties of aconitine. After he was condemned to death, however, they went to work to collect in America proofs both of insanity and of odd notions about this particular poison, and put our Government in motion to obtain a respite, which was granted. The affidavits, however, were produced in such numbers, and opened up so many new fields of investigation, that it was found impossible to get them all to London before the day of execution, and Secretary Frelinghuysen accordingly telegraphed a synopsis of their contents, so that Mr. Lowell might ask for a further reprieve. It appears that it is now discovered that, besides having had much insanity in his family, and holding strange views about aconitine, Dr. Lamson was much addicted to the use of opium. There cannot be any doubt that if he were respited till next December, the supply of affidavits would not diminish in the smallest degree, and that if evidence of this sort was all that was needed to postpone the execution, the day for it would never come. It is difficult to see how Mr. Frelinghuysen can expect a civilized government to disregard the solemn findings of its own courts, in deference to hasty depositions, forwarded from remote parts of the world, of persons about whom nothing is known to the prosecution, and whom it cannot cross-examine.

Captain Howgate, who some months since was discovered to have embezzled large sums of money from the Government while in charge of the Signal Service, was unable to procure bail, and therefore had to go to jail. The severity of his confinement was mitigated by his being allowed from time to time to go home in the custody of an officer and see his family. The practice of letting prisoners confined for financial irregularities out on "leave" of this kind is said to have become very common of late years. The court sends an officer with the prisoner to prevent his escape, and on Thursday Judge Wylie granted an application of this kind made by Captain Howgate, who wanted to see his daughter, lately returned from Vassar College, and "to look over certain papers." The "oldest and most trustworthy of the court bailiffs" was sent with him. In some way, however, the bailiff "lost sight of" Captain Howgate for a moment, and when he "turned around," Captain Howgate was gone. The young lady from Vassar said that her father had "stepped out," and kindly asked the bailiff to sit down. This he declined to do, and insisted on searching the house, but, strange to say, could find no trace of Captain Howgate. There was just the same difficulty in finding Tweed when he ran away. In such cases the hard thing to explain is why the prisoner should be put to so much trouble to furnish bail. He generally cannot do it, and has to go to jail, but as he is then allowed "leave" of this sort, why would it not be simpler to let him go at large at once on his promise to reappear when wanted?

Senator Voorhees made a terrible speech in the Senate on Friday on the "dungeon" question, the galleries being filled with Irish Land Leaguers. He handled Mr. Lowell very roughly, and suggested the impeachment of Mr. Blaine for failure to go to war about MacSweeny. His voice shook, it is said, with emotion, and his frame trembled, showing that his indignation is genuine, and not, as many suppose, simulated, and must be ascribed to morbid nervous conditions rather than to ambition. He was, however, speaking under great disadvantages, for there was no way permissible under the rules of the Senate in which he could come up to the standard of excitement fixed by the Land Leaguers as becoming in an American legislator in the matter of dungeons. Mr. Robinson was in the gallery, and talk of war, as war is now conducted, must have seemed to him very milk-and-water stuff. He wants to carry it on after the manner of the ancients, with total destruction of cities, slaughter of the males and children and old women, and captivity of the young women. That is what Mr. Lowell ought to have threatened, and what Mr. Voorhees ought to have called for. Seriously speaking, the enjoyment the Irish get from speeches like Voorhees's is one of the most melancholy features in their case. It is calculated to make them seem in the eyes of all the successful nations of the earth an irrational people, incapable of self-government, and devoid of the nobler human pride. To a people capable of achieving their independence against England a speech like Mr. Voorhees's in their behalf would be insulting, as betraying a very low estimate of their intelligence.

No man in the Tory party in England had a higher reputation for ability than Lord Salisbury when he took office under Disraeli, and he kept it, down to the Turco-Russian war. How rapidly he got rid of this reputation during the following two years is now matter of history. Unluckily, while losing it, he managed by divers small indiscretions to lose also his character for strict veracity, which is one of the greatest misfortunes that can befall a public man in England, unless he is able, like Disraeli, to laugh off his falsehoods and evasions. Few people supposed, however, when after Beaconsfield's death Salisbury was put in charge of the party in the Lords, that he would lead it in a mood of such permanent exasperation. He talks about Gladstone in a way which hitherto has been considered very unbecoming, and which is fully as gross and insolent as the language which Biggar, the most foul-mouthed of the Irish members, uses toward the Premier in the Commons. A man, however, often talks foolishly without acting indiscreetly, and an occasional volley of abuse in the Lords would not hurt the Conservative leader if he were shrewd and prudent in action. But the Tory Peers have committed blunder on blunder under his orders. The rejection of the first Land Bill staying evictions, last fall, undoubtedly had the effect of making the second and great one more sweeping in its provisions, when it came, than it would otherwise have been, and made the Liberals more tenacious about passing it in its original shape.

The Act once passed, there was but one alternative for the Peers, and that was to let it alone, or work for its success. But they did neither. They began to denounce it for doing injustice to the landlords from the first month, and then committed the folly of appointing a committee to inquire into its working almost as soon as it had begun to work, with the avowed object of discovering whether the landlords could not be saved from it. This led to a snub from the Commons by which the committee was discredited, and the Lords humiliated, and the Tories placed once more in the position of implacable enemies of the tenants. Lord Salisbury, however, has not stopped here. His last move has all the air of that of a man in a passion. He is reported to be preparing for another extraordinary blunder, by proposing that, if the closure is passed, the Lords should assume that debate is not free in the House of Commons, and that therefore the sense of the country cannot be ascertained from its debates, so that they will be justified in forcing the Liberal Minister to find out the opinion of the country by dissolution, by resisting the passage of any leading measure which they dislike, no matter by how large a majority it may be carried in the Commons. Such a programme as this could only succeed by being kept secret. If it is once known the Lords are blocking legislation because they do not approve of changes made by the House of Commons in their own rules, of course the country would passionately support the Minister in bringing them to reason by making new Peers. It is, therefore, within the bounds of possibility that Lord Salisbury, in trying to force the Liberals to dissolve, might bring on his party in the upper House another great humiliation—that of having to surrender in order to avoid being flooded with new men.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

A COMMITTEE representing the National Land League Association waited upon the President on Friday afternoon, and submitted a resolution offered by Mr. Boyle O'Reilly and adopted by the Convention, regarding the imprisonment of American citizens, and asking the recall of Minister Lowell. The President said he would give the matter his early attention. There have been many rumors during the week, to the effect that Mr. Lowell would be recalled; and Secretary Lincoln and Mr. Bancroft Davis have been mentioned as likely to succeed him.

The President has informed General Fitz-John Porter, in answer to his petition for relief from the sentence of the court-martial, that it is beyond his power to do anything in the case. This action is based on an opinion by Attorney-General Brewster, which received the unanimous concurrence of the Cabinet. Mr. Brewster says that he agrees with the conclusion reached by President Hayes's Cabinet, and with the opinion of the Supreme Court, "that where the sentence of a legally constituted court-martial, in a case within its jurisdiction, has been approved by the reviewing authority, and carried into execution, it cannot afterward, under the present state of the law, be revised and set aside."

The President sent two messages to Congress on Tuesday, one asking that some action be taken in regard to the invitation extended to all the independent countries of North and South America, to participate in a general congress at Washington, "for the purpose of considering and discussing the methods of preventing war between the nations of America," and the other recommending an appropriation of $2,020,000 for restoring the Mississippi River levees instead of $1,010,000, which was the amount recommended by the Mississippi River Commission for that purpose.

A mass-meeting of from 6,000 to 8,000 workmen, representing all trades, was held in Philadelphia on Saturday evening, to express indignation at President Arthur's veto of the anti-Chinese Immigration Bill.

On Wednesday the House Committee on Education and Labor, by a strict party vote, agreed to report to the House a new bill to suspend Chinese immigration. This bill fixes the period during which immigration shall be suspended at ten years, and for the passport system contained in the vetoed bill a certificate system is substituted. There are also other minor modifications, and it is thought that it is now in a form consonant with the spirit of the treaty, and one which would secure for it united Republican support. It was passed by the House on Monday by a vote of 201 to 37.

A caucus of the Republican members of the House of Representatives was held in Washington on Friday evening to take measures regarding the future order of business in the House. Mr. Robeson presided. Speeches were made by the friends of several public measures which they regard as of primary importance. In regard to the question of the extension of National-Bank charters, the general sentiment of the caucus seemed to be that the Republicans could not afford to allow this Congress to adjourn without passing a bill providing for such extension. After an "animated but harmonious" discussion, it was finally decided that the order in which the different measures should be considered should be left to a committee of seven to be appointed by Mr. Robeson.

An effort was made in the House on Monday to have a day set for the consideration of the bill to amend the National Banking Law and to provide for the extension of the National-Bank charters. The resolution required a two-thirds vote, but received only 148, while 89 Democrats and Greenbackers voted against it.

Speaker Keifer has removed another House stenographer, Andrew Devine, who is said to have taken the part of the removed stenographer, Mr. Hayes, and has appointed J. C. W. Tyson, formerly Mr. Robeson's secretary, in his place. Both these removals have caused unfavorable comment in Washington.

The Senate passed the bill known as the "Omnibus Claim Bill" on Friday. It contained 1,359 claims of individuals which have been properly examined and approved, and which amount in the aggregate to about $291,148.

The Shipherd investigation, before the House Committee on Foreign Affairs, has become very interesting during the week. On Thursday, under Mr. Belmont's examination, Shipherd testified that up to the 3d of December, 1881, he believed that Mr. Blaine "intended in absolute good faith to coöperate with me, as he always intimated, suggested, implied, and declared that he would," but that it was his opinion that the aim and object of the Secretary in so doing was "purely political." The witness gave an account of a conversation he had had with Mr. Blaine, in which he told Mr. Blaine that he (Shipherd) had been defending General Hurlbut, and asserting, "in season and out of season, that he has done just what you told him." This seemed to please Mr. Blaine, who said, "Gentlemen, there are various ways to give diplomatic instructions. We not only write on the lines, but a trained diplomat will read between the lines, and sometimes he will read on the margin." Soon after this Shipherd had a conversation with General Hurlbut's brother, Mr. William Henry Hurlbert, the editor of the New York *World*. The latter "complained most bitterly that Secretary Blaine had ruined General Hurlbut by leading him to do exactly what Mr. Blaine wanted done, but then publicly disavowed the responsibility for it." Mr. Shipherd then related Mr. Blaine's above-mentioned remarks on diplomacy, at which Mr. Hurlbert "was surprised, and a startled look came into his face as he said: 'Did Blaine say that? Then I have him. I have in my possession a despatch on the margin of which, in Mr. Blaine's handwriting, is written, 'Go it, Stephen.'" After this, Mr. Shipherd said he "thought he saw how Secretary Blaine could deem it proper to lead a Minister, to lead such a man as myself, on a certain line up to a certain point, and then drop him." On Friday Shipherd was very closely pressed by Mr. Belmont, but refused to answer a number of pertinent questions, which caused Mr. Belmont on Saturday to refuse to question him any further. On the same day the chairman of the committee submitted a request from Mr. Blaine to be allowed to be heard. On Tuesday the examination was continued, but Shipherd again refused to answer pertinent questions, and evaded everything calculated to throw any further light on the matter.

Ex-Senator Dorsey appeared in court at Washington on Tuesday, and pleaded not guilty to the indictment which the Grand Jury found against him in the Star-route cases, and the order for the forfeiture of his bail was set aside. The counsel for the Dorsey party then moved for a bill of particulars, asserting that they had a right to know what affidavits, letters, or petitions, alleged to have been fraudulent, were referred to in the indictment. This is an attempt to make the Government disclose its case to the defence before trial.

The jury in the South Carolina election cases have rendered their verdict. The accused were the Managers of Election in the Acton Precinct, Richland County, and the jury found that they had hindered and obstructed the Supervisor of Elections in the performance of his duty by refusing to allow him to see whether the ballot-box was empty before the voting began, but did not find the managers guilty of stuffing the ballot-box with tissue ballots. The verdict was signed on Saturday, but on Monday two of the white jurors informed the court that they had signed "under a misapprehension, and under stress of bodily pain"; but the Court ruled that this avowal, coming after the rendering of the verdict, was too late. The defence, however, have taken advantage of this point to move for a new trial, and thus delay sentence.

Ex-Governor Jewell, Chairman of the Republican National Committee, called a meeting of the Committee, which was held in Washington on Saturday. A resolution calling a meeting of the Committee for the fourth Wednesday of January, 1883, was adopted, and the subject of the party interests in the Southern States was then talked over. All the members of the Committee present were unanimous in expressing the opinion that, wherever possible, a union should be effected in the Southern States with such liberal elements in those States as indicate progress in the direction of a liberal national sentiment and broader national ideas.

The North Carolina State Republican Executive Committee has decided to call a State Convention to meet on the 14th of June. The Committee has adopted a resolution favoring an alliance with the Liberal movement in the State.

The Congressional Reapportionment Bill recently passed by the Virginia House of Delegates, the effect of which would have been to give the Readjusters eight out of the ten Congressional Districts of the State, has been defeated in the State Senate by a vote of nineteen to sixteen. Four Readjusters voted with the Democrats against the bill.

The Connecticut House of Representatives has passed by a two-thirds vote a proposed constitutional amendment absolutely prohibiting the manufacture and sale of alcoholic liquors within the State except for medicinal purposes. The measure now has to go over to the next Legislature and pass both Houses by a two-thirds vote before being submitted to the people.

Mr. John F. Slater, a wealthy manufacturer of Norwich, Connecticut, has given one million dollars for the education of colored people in the South. The fund is to be put into the hands of a board of trustees, of which, among others, ex-President Hayes and Chief-Justice Waite are to be members.

Bishop Paine, of the African Methodist Episcopal Church, having been prevented from riding in one of the cars of a railroad train in Florida on account of his color, a deputation of the church, accompanied by Mr. Frederick Douglass, called upon Attorney-General Brewster on Wednesday and made a complaint against the United States Attorney for the Northern District of Florida for failure to enforce the Civil Rights Act. It was represented that all applications to the District Attorney for legal redress had proved of no avail. Mr. Brewster promised that the matter should be investigated.

A mass-meeting was held by the New York Free-Trade Club in Chickering Hall on Friday evening for the purpose of discussing the necessity of reform in the present tariff. A large audience was present, and addresses were delivered by Mr. Everett P. Wheeler, the President of the Club; Senator Vance, of North Carolina; and Professor Sumner, of Yale College.

Mr. Wayne MacVeagh delivered an address at the annual meeting of the Civil-Service Reform Association in Philadelphia on Thursday, in the course of which he said that his party had left him in a predicament, as it seemed to have but three great principles—namely, "The Spoils System, the Boss System, and Repudiation in Virginia," to all three of which he was opposed.

The War Department is informed that arrangements have been made for supplying the suffering Arrapahoe and Cheyenne Indians until Congress makes proper provision for their maintenance, and that there is no apprehension of further trouble.

Captain Howgate, who has been confined in the Washington jail under charges of misap-

propriating money belonging to the Government while Disbursing Officer in the Signal Service, escaped from the custody of the officer having him in charge on Thursday.

Twenty-four wagon loads of furniture and other household articles from the White House were sold at public auction on Friday. This is the first sale of cast-off articles since President Buchanan's Administration. About $6,000 were realized.

The operatives in the Pacific Mills at Lawrence, Mass., having refused to resume work unless their demands were complied with, the directors have decided that the mills shall not be started for about six months, which time will be occupied in making repairs and introducing new machinery. This course will leave about 3,000 operatives idle, and considerable privation and suffering seem likely to follow.

It was announced on Saturday that the well-known New York dry-goods firm of A. T. Stewart & Co. had determined to discontinue their dry-goods and manufacturing business.

The Board of Overseers of Harvard University passed on Wednesday, by a vote of 12 to 11, a resolution "that in the opinion of this board it is not advisable for the University to give any assurance or hold out any encouragement that it will undertake the medical education of women in the Medical School of Harvard University."

News has been received from eastern Siberia, by way of Irkutsk, that the United States ship *Rodgers*, which sailed from San Francisco last summer in search of the *Jeannette* and missing whalers, has been burned and sunk. Lieutenant Berry, with the officers and crew, thirty-six in number, is at Tiapka, near Cape Serdze. The despatch containing this information was sent forward by Mr. W. H. Gilder, the New York *Herald* correspondent who accompanied the expedition.

FOREIGN.

An enthusiastic Conservative banquet was held in Liverpool on Wednesday, at which 600 persons were present. The Marquis of Salisbury presided, and Sir Stafford Northcote, the Duke of Abercorn, and many other leading Tories were present. The Marquis of Salisbury dwelt on the gravity of the situation in Ireland, and severely reviewed the Government's policy and the Land Act. He deprecated pandering to agitation, and advocated Mr. William Henry Smith's proposal to increase the powers of the Commissioners so as to enable Irish tenants to become owners of their lands.

The official list of suspects detained in prison on April 1 places the number at 511, of whom twenty-eight are reasonably suspected of murder as principals and seven as accessories. The Catholic clergy of the diocese of Cashel and Emly have passed resolutions pledging themselves to exert all their influence to prevent outrages, demanding the cessation of coercion and eviction of tenants for arrears of rents, and also pledging themselves to coöperate with the people's representatives with the object of securing an amendment to the Land Act. Mr. O'Donnell, Member of Parliament for Dungarvan, has published a long letter in the London *Times* in which he maintains that the question of arrears is the one question to which all men responsible for the government of Ireland ought to turn their special attention. He says if the arrears difficulty be solved, every difficulty will be solved; but if not, then "farewell to the hope of peace, progress, and contentment."

The American suspects now in prison have been offered their liberty on the condition of their leaving the country, but they have refused the offer. Mr. Lowell, acting under instructions from Washington, has demanded their trial or release, but in the House of Commons on Monday evening, Sir Charles Dilke, Under-Secretary for Foreign Affairs, said it was true that the American suspects had been offered conditional liberty, but he knew nothing of Mr. Lowell, the American Minister, having demanded their immediate trial or release.

Five hundred and thirty-one cases of agrarian outrages were reported to the Chief of the Irish Constabulary during the month of March. Two hundred and thirty-seven of the outrages were committed in Munster, 124 in Leinster, 122 in Connaught, and 48 in Ulster.

It is stated on good authority that the expense of administering the Land Act has thus far cost the Government £90,000, while the reductions of rent made by the Land Commissioners it is estimated reach £30,000.

Mr. Gladstone, replying to a letter from Mr. Henry Broadhurst, Liberal member of Parliament, who wrote to inquire concerning the truth of the rumor that the Government was prepared to consider an amendment making a two-thirds majority necessary to close debate, said: "We have surrounded the closing power with strong safeguards, and we propose that when it has to be applied it shall be by a simple majority. This proposal we will to the best of our ability press upon the House."

A respite has been granted to Dr. Lamson until April 28, but the prisoner has been also informed that no further respite will be granted him, and that no evidence which has thus far been submitted to the Secretary of State, either from England or the United States, affords any justification for advising any interference with the sentence of the law.

An explosion has occurred in the Black Horse Colliery at Sunderland, England. Four bodies have been recovered, but fourteen persons are still missing.

The Lord Mayor of London has published a letter asking for subscriptions to raise a fund of £6,000 or £7,000, to despatch to Canada a party of 200 families of the unemployed poor of London; and at a meeting held in London on Thursday, at which Cardinal Manning, the Baroness Burdett-Coutts, and others were present, it was unanimously resolved to form a committee to aid in the work.

A despatch from St. Petersburg states that the Governor of Podolia reports that anti-Jewish riots occurred at Balta on the 11th inst. He immediately proceeded thither with troops, and succeeded in suppressing the disturbances after some hours, but they were renewed during the night. Order was reëstablished on the 12th by reinforcements of troops. At Letitshev on the 12th inst. the houses of the Jews were attacked. Mr. Oliphant, the representative of the committee to aid Russian Jews, arrived at Lemberg in Galicia on Friday, and had an interview with the Governor, after which he went to Brody to make arrangements for the emigration of 12,000 Jews to America.

A despatch to the London *Times* from Odessa, dated Sunday, says that the Jews are flocking to that city from Balta and its vicinity. All their houses are said to have been wrecked and their property destroyed. Two hundred Jewish refugees passed through Lemberg on Sunday on their way to America, and two hundred more were expected to arrive there on Monday.

Five thousand Jews were recently expelled from Moscow, and during the Easter holidays the streets of Odessa were patrolled by troops. Seven hundred persons, mostly without passports, have been arrested in the neighborhood of Odessa within the last few days.

The Minister of the Imperial Household at St. Petersburg has issued a private circular announcing that the coronation of the Czar will take place in August, and that by Imperial command all dignitaries of the Empire must attend the ceremonies at Moscow. The festivities will last a fortnight, and it is estimated that the expenses will amount to 10,000,000 rubles. The celebration when the last Czar was crowned lasted a month and cost 18,000,000 rubles.

It is reported that eighty workmen who were employed on the Cathedral of the Assumption, at Moscow, in which the ceremony of the coronation of the Czar is to take place, were recently arrested in consequence of the discovery of a mine under the building.

A despatch from Constantinople says that the Russian Ambassador to Turkey recently announced that he intended to go on a furlough for several months, and adds that this is generally regarded as a warning to the Porte that Russia's patience is nearly exhausted by the indemnity negotiations. The Porte has stopped all press despatches in reference to the incident. The Sultan has since been making efforts at conciliation.

Leave of absence for an indefinite period has been granted to Field Marshal Count von Moltke. This is regarded as a positive indication of the present pacific aspect of affairs in Europe.

It is said that a tacit amnesty will be granted to such of the insurgents in Herzegovina as return to their homes and labor quietly on their lands.

At the opening of the Austrian Delegations on Saturday the President expressed the hope that the last remnants of disorder would shortly be suppressed in the occupied provinces in preparation for the time when they are to be incorporated in the empire. A bill for a credit of 24,000,000 florins for defraying military expenses was referred to the Budget Committee, with instructions to report upon it as soon as possible.

A deputation of the corporation of Barcelona had an interview with King Alfonso on Wednesday, and protested against the adoption of the proposed treaty with France. King Alfonso assured the deputation of the interest he felt in the welfare of Catalan industry, and promised to inform the Cabinet of their demands. He added that he was, above all things, a constitutional monarch. The Spanish Government has decided not to make approval of the treaty a question of confidence in the Ministry, but will allow the Ministerial deputation to vote according to their opinions. It is also stated that Señor Comacho, Minister of Finance, will not resign until the treaty with France and the bill for the conversion of the debt are adopted. In the debate on the treaty in the Chamber of Deputies, on Friday, Señor Lambrus, member from Catalonia, demanded protection for all branches of Spanish industry, adding that without protection the industries could not exist. On Monday, the amendment that the treaty with France be terminable at a year's notice, was rejected by a vote of 202 to 65, but the protectionists are said to be confident that they can defeat the adoption of the treaty and obstruct other portions of the free-trade policy of the Liberals.

The French imports for the first quarter of the present year show an increase in value of 182,000,000 francs over the same period in 1881. The increase is principally in raw materials. The exports during the same period increased, principally in manufactures, 119,000,000 francs.

A despatch from Paris states that 5,000 employees, representing every trade connected with the manufacture of iron, have struck against the proposal of the masters to deduct forty centimes on every hundred francs of wages, to be applied to the payment of insurance premiums of the men against accidents.

The correspondent of the London *Post* at Paris says that M. de Freycinet is much annoyed on account of the bad impression which the appointment of M. Roustan as Minister to Washington has produced. Persons interested in the Panama Canal scheme have warned the French Government that the American Government fears M. Roustan will follow on the Panama Canal question a policy of intrigue similar to that followed by him in Tunis. The correspondent of the *Post* at Berlin says that the appointment of Herbert Bismarck as Minister to Washington is probable.

TUESDAY, April 18, 1882.

WHAT IS OUR PRESENT SYSTEM OF APPOINTMENT?

THE plan of filling vacancies in the subordinate branches of the public service by competitive examination in the initial stages and promotion in the higher ones, has been met by the friends of the present system with two arguments. One is, that you cannot ascertain a man's fitness by an examination, inasmuch as moral qualities, the possession of which is ascertainable only by experience and personal knowledge, form the larger part of his equipment. The other is, that in looking for the right sort of men the President must have assistance, and that better assistance he cannot have than the Senators of his own party, and that in recommending candidates Senators cannot do better than recommend persons whom they have tried and found able and useful in the political arena. Now this system is intelligible and logical. It is the spoils system, under which the public offices are divided for short terms among the party workers, under Senatorial supervision, but with a certain attention to capacity. As this system is described in Stalwart speeches and articles, anybody, whether he likes it or not, can understand it. It is said to be the American system *par excellence*, by which, without any extra cost to the country, a class capable of running the party machinery is provided without creating a bureaucracy or an oligarchy.

Curiously enough, however, the friends of the system, though they defend it on paper, seem never to put it into operation, so that we are driven to ask whether they really believe in it. General Grant professed after the first year to believe in it, or at all events to see no proper substitute for it, and yet he never carried it out. He filled places more than once, not only in opposition to the wishes of the Senators of the State, but in opposition to the wishes of the bulk of the party, as in the Simmons case in Massachusetts. General Garfield announced in his letter of acceptance and in his inaugural that he would defer to Senatorial advice, and that he thought officers should hold during their term without disturbance, but he removed Mr. Merritt in the middle of his term against the protests of the New York Senators. Mr. Arthur, too, is of opinion that appointments should be made under Senatorial advice, and that the tenure should be stable. But he has in Massachusetts just disregarded the wishes both of the Senators and the party by the appointment of Mr. Worthington, and has shown that he does not think the tenure should be stable by the removal of Mr. Beard without cause. At this moment in Pennsylvania he has removed a Collector of Internal Revenue, with whom no fault is found, to make way, on the demand of Senator Cameron, for one to whom the other Pennsylvania Senator, Mr. Mitchell, is violently opposed, and with the full knowledge that the change is likely to widen the serious breach which has already shown itself in the Republican party in that State, and give great dissatisfaction to a section of the party all over the country which had a large majority in the last National Convention. So here we have not only the Senatorial right to share in the patronage, but also the value of the officeholder to the party, totally disregarded.

If the system of the reformers is not the best one, or not the one best adapted to American society, it is at least quite certain that some system is imperatively called for. If the spoils system is the best, let us have it; but do not let us go on pretending to administer the spoils system, and in reality administering no system at all. The spoils system really seems to exist only on paper. In practice the offices are used, not to oblige the Senators nor to build up the party, but to exasperate the Senators and split the party. They are distributed, not under the theory that they are the spoils of the party, but the private plunder of individuals, and are divided with a sort of Asiatic caprice. It is time now that the friends of the spoils system should stop writing magazine articles about it, and give us a pure specimen of it, in actual operation, or else make way for something else. The party could not, on their own showing, be in a worse plight under any system than it is now. Half the "practical men" hate the other half, and think they are ruining the organization. In Massachusetts, apparently no Republican thinks well of the appointment of Mr. Worthington but Mr. Worthington himself, and in Pennsylvania, although Senator Cameron thinks the President is acting splendidly, Senator Mitchell says that if he keeps on in his present course, the Republican party in the State will be driven out of power. It is sometimes said tauntingly of the reformers that if they wish to accomplish anything they "must agree upon a plan"; but the sneer, coming from the engineers who manage the patronage in this State and in Massachusetts and Pennsylvania, has a truly comic sound.

THE DEADLOCK IN THE SPANISH CLAIMS COMMISSION.

THE rumor is said to be current at Washington that Mr. Frelinghuysen will, at an early day, reverse the decision made by Mr. Blaine with regard to the jurisdiction of the Spanish-American Claims Commission over the question of the citizenship of claimants. The difficulty arose in the case of one Buzzi, in which the Commission decided that the mere production of naturalization papers was not enough to entitle a claimant to a standing before the Commission, but that it had power to inquire within certain limits whether they were properly granted. Mr. Blaine thereupon announced that the Government could not submit the cases remaining unsettled "to the application of principles distinctly repudiated by the Agreement itself." These principles he stated to be:

"that the Commission has the right to go behind the certificate of naturalization to decide, not whether the court which issued it was of competent jurisdiction, nor whether it rightly administered that jurisdiction, nor whether a certificate of naturalization has been granted to the claimant, but whether it has been properly granted—in short, that the Commission is a court of appeal with the right to review the duly rendered judgment of a court of the United States."

This statement did not do much to make the position taken by the State Department very clear, because although it sounds as if we were taking "high ground" in defence of the rights of American citizens, when closely examined it turns out to consist mainly of a distinction without a difference. The idea suggested is that while the Commission cannot inquire whether a certificate has been "properly granted," it may inquire whether the court which issued it was of competent jurisdiction, whether the jurisdiction had been properly administered, and whether a certificate had been granted to the claimant. But these questions are all branches of the general question whether the certificate had been "properly granted."

On looking into the proceedings of the Commission itself, previous to Mr. Blaine's announcement, we find that questions of the right to American citizenship had frequently come up, and had been disposed of in a way which shows that the Commission had always regarded itself as having very broad powers of inquiry into the standing of claimants as American citizens. The Agreement under which the Commission sits was concluded in 1871 between Spain and the United States, through General Sickles, then American Minister at Madrid, and the Spanish Minister of State. It provided for a general arbitration of the claims of American citizens or their representatives for injuries to person or property by the Spanish authorities in Cuba since the beginning of the rising against Spain in that island. The Commission under the agreement consists of two arbitrators, who name an umpire to decide in case of disagreement. The agreement contains the following provisions on the subject of citizenship:

"No judgment of a Spanish tribunal, disallowing the affirmation of a party that he is a citizen of the United States, shall prevent the arbitrators from hearing a reclamation presented in behalf of said party by the United States Government; nevertheless, in any case heard by the arbitrators, the Spanish Government may traverse the allegation of American citizenship, and thereupon competent and sufficient proof thereof will be required. The Commission having recognized the quality of American citizens in the claimants, they will acquire the rights accorded to them by the present stipulations as such citizens."

These provisions were intended to guard against any sham claims, on the one hand, and any arbitrary interference with rightful claims on the other. The correspondence between the two Governments shows that there were believed to be cases in which Cuban courts had rendered decisions as to naturalized American claimants, originally Cubans, denying them any American status. It was accordingly provided that the tribunal could go behind such decisions. To offset this, it was agreed that Spain might traverse the American status of any claimant and put him to the proof of it.

Obviously, in requiring this proof, the Commission must be governed by some system and rules. In the case of naturalized citizens, where the papers are granted by a court of competent jurisdiction, and are regular on their face, it cannot insist that the whole case shall be gone into again; this would be really to hold sittings as a court of naturalization; on the other hand, if the naturalization was alleged to have been obtained by fraud, it could hardly pass the claim without an investigation of the charge. Several cases have already come before the Commission for adjudication, and it seems to have found little difficulty in disposing of them.

In the case of Delgado, a naturalized citizen, decided in 1879, the question mooted was whether the naturalization, regular on its face, was vitiated by the fact that the claimant, during his five years of residence in the United States, had been once or twice absent from the country. The arbitrators disagreed, and the umpire held that this was a purely legal question of the construction of our municipal law on the subject of the right to naturalization as affected by residence; that the decisions of our courts must be followed; that the claimant's status as an American citizen could not be reconsidered. The umpire at that time was M. Bartholdi. The umpire who succeeded him, Baron Blanc, sustained the position thus taken in a subsequent case, upon which the Spanish arbitrator filed a formal protest, taking the ground that the tribunal was not bound in any way by the decision of any American court, but that certificates of naturalization, though valid for every purpose within the United States, had no binding force before the tribunal.

The next case which arose was that of Portuondo, in which the question of residence again arose. This question had been passed upon by our courts in his favor, and the tribunal following them decided that it would not go behind the certificate. The decision, however, contains these significant words: "Such certificate not being proved or charged to have been procured by fraud or issued in violation of public law, treaties, or natural justice"—grounds of impeachment, the umpire significantly adds, upon which "any certificate of naturalization may be declared altogether void."

This brief review of the proceedings of the tribunal shows that it has followed hitherto the only course which an international court can take as to questions of the citizenship of claimants. Where the question involves the construction of the laws of the country granting the naturalization, it is bound to follow, just as any foreign court would follow, the local interpretation and adjudications. When, however, the local proceedings are fraudulent, or in conflict with some treaty or general principle of public law, the tribunal must inquire into the facts; otherwise there is no restriction upon the manufacture of utterly sham claims. The cases still to come before the Commission are believed to be based in many instances on naturalization papers obtained by fraud; and this fraud, which, it must be remembered, is a fraud upon our own courts and our own laws, we have, to say the least, no interest in sustaining. The withdrawal of our Government from the arbitration under such circumstances, would seem to be unjustifiable; and it must be said that there is something rather comical in the fact that the withdrawal of the late Secretary of State should have been accompanied by an explanation of his reasons which, in the light of the agreement and the proceedings of the tribunal, is unintelligible.

HERZEGOVINA.

For the third time within a year the Delegations of the Vienna Reichsrath and the Diet of Buda-Pesth have been assembled to discuss the common affairs of the Austro-Hungarian Monarchy, and vote supplies. The second meeting took place on the outbreak of the insurrection in Crivoscie and Herzegovina, the common Government demanding and obtaining 8,000,000 florins as an extra grant for its suppression. Last Saturday, after months of fighting with almost uninterrupted success, the Government asked for three times that sum, to enable it to complete the work of pacification. Crivoscie, the rebellious district near the southern extremity of Dalmatia—a province properly belonging to the Empire—has been almost completely reduced to submission; but Herzegovina, a semi-dependency, not trained to obedience, and provoked by excesses of a rule but recently and arbitrarily imposed upon it, is not yet subdued. At first there was only talk of brigandage, a chronic disease in those border lands of the Slav, the Turk, and the Albanian, which had to be cured by heroic means; later, however, the real nature of the evil had to be admitted, and the numerous bulletins issued by the commanders of the Imperial troops, while extolling the valor of the forces sent to suppress the disorders, acknowledged the existence of an insurrection. It is now alleged that the insurrection is in its last agony, and that the large fresh supply of money demanded is partly to cover expenses already incurred, and partly such as are needed for the erection of forts and block-houses destined to prevent future outbreaks.

Whether all this be really so may be doubted. The rising in Herzegovina is, perhaps, far from expiring, and the milder season now beginning may, by reopening paths inaccessible to regular forces through the summits, gorges, and forests of that sub-Alpine country, and restoring the cattle to the higher valleys and slopes, create opportunities for guerilla warfare such as the winter, with its cold, ice, and snow-drifts, did not afford. It must be acknowledged, however, that the revolt has within the last two months shown decided indications of decline and exhaustion; that it has from the beginning lacked the patriotic—or, say, fanatical—inspiration which marked the contest with the Turks in 1875–6; and that the Imperial army has in every respect been well handled. The clearing of the Zagorye highlands between the upper Narenta and the upper Drina, for a time the main seat of the insurrection, by a concentric movement from four points, was a creditable piece of strategy, and, considering the difficulties under which it was executed, it may deserve a good part of the praise so lavishly bestowed upon it. The capture of Ulok in the centre of Herzegovina, like that of Dragal in Crivoscie, was achieved with trifling loss, and the operations destined to drive isolated detachments of the insurgents across the Montenegrin frontier have in some instances been carried out with precision. That the Austro-Hungarian forces are overwhelmingly large need hardly be said.

The Austro-Hungarians owe, however, their success, as far as it goes, mainly to the circumstance that Bosnia, the other Turkish province which they "occupy and administer," by right of an article in the Berlin treaty of 1878, did not join in the rising of the Herzegovinians. The Bosniaks were, like the latter, subjected to military conscription by a decree infringing upon the reserved rights of the Sultan, acknowledged by Austria-Hungary in a treaty concluded in April, 1879, prior to the occupation of the Sanjak of Novi Bazar; but it was probably the influence of the very Moslem element to which those rights were sacred, that prevented a general revolt in the province. The Moslems had had their full share of fighting before and during the Austro-Hungarian invasion, and they were tired of it. The Porte, leaning for protection on Austria-Hungary's ally, Germany, gave no signal for revolt, and no prospect of independence under Mohammedan auspices lured the former masters of Bosnia to partake in a struggle the favorable issue of which would subject them to a Christian rule—native or Servian—incomparably more oppressive than that of Austria-Hungary. And it is probably the dread of a new conflict with their warlike Moslem neighbors, in addition to the contest with the forces of Austria-Hungary, which has kept the Christians of Bosnia quiet, while their brethren of Herzegovina—in which there are but few Moslems—have been fighting for freedom, for independence under a Slavic banner.

Another circumstance highly favorable to the Austro-Hungarians has been the disorganized condition of Russia's foreign diplomacy, caused by her worse internal disorganization. Neither Montenegro, nor Servia, nor Bulgaria has dared to aid the insurgents of Crivoscie and Herzegovina, openly or secretly, seeing no sign of encouragement on the part of the Czar. In 1875 volunteers from Montenegro and Servia flocked to Herzegovina and Bosnia in large numbers; those principalities being sure of Russia's protection. And when, in the following year, both Prince Nikita and Prince Milan declared war on the Sultan, thousands of Russian soldiers were allowed by Alexander II. to join their banners; when Servia succumbed, the Czar saved her by direct intervention. Nothing of the kind is now allowed or promised by Alexander III., the captive of Gatchina, who still dreads to add the dangers and cares of a foreign war to the terrible perplexities which oppress him at home. Yonin, the Czar's agent in Montenegro, who formerly plotted in Herzegovina, and was lately suspected of doing so again, has been called away from Tzetinye; and Hitrovo, the Russian agent in Bulgaria, has openly declared in Sophia that his master condemns secret interference in favor of the Herzegovinians. Nikita keeps up a military cordon on the borders of his principality, and disarms and interns the fugitive insurgents who cross his frontiers; and Milan is so delighted with the friendly readiness evinced by the courts of Vienna and Berlin, above all others, in acknowledging him as King, that he does his best to prevent his subjects from giving aid and comfort to the enemies of the Teuton and Magyar.

It may appear strange that it is chiefly the Magyars and Germans in Austria-Hungary who are anxious to change the occupation of Bosnia-Herzegovina into complete and permanent annexation to the Empire—they who, in 1878, most vehemently opposed the invasion of the Turkish provinces—while a large portion of the Czechs and Croats, who then favored the occupation, now warmly sympathize with the insurgents. The explanation of this new

change in the constantly shifting kaleidoscope of Austro-Hungarian public sentiment is, however, easy. The invasion in 1878 was a move against Turkey, with whom Magyars and Germans sympathized in her struggle against Russia, from dread of the latter—a move calculated, if carried out completely, to add to the strength of the Slavic element in the dual empire of the Hapsburgs. Now, since Turkey has no chance of recovering the two provinces, in which the Moslems have lost all their former administrative and social control, annexation means the destruction of the Slavic hopes of founding a South-Slavic power or union, embracing, in one form or another, Montenegro, Bosnia, Herzegovina, and Servia—possibly also Dalmatia and Croatia—and likely to follow the lead of Russia in a combined assault on Austria-Hungary. It is, therefore, not at all surprising to hear the President of the Cisleithan Delegation—a German—express, at its opening last Saturday, the hope of a speedy incorporation of the occupied provinces in the Empire. The Hungarian Delegation will vote the grant asked for unanimously, or almost unanimously; the Cisleithan will give a decided majority in favor of it, the Poles voting with the Germans. The new burden is not insignificant, considering the permanent deficits in the budget of the monarchy; but economic reasons are silenced by political considerations and passions, and the Government knows no way of retreating that would not be a confession of a bad defeat, before Russia and the rest of the Slavic world.

STEWART'S.

THE announcement that Stewart's is not any longer to be one of the "institutions" of New York has probably taken few people by surprise. Almost ever since Stewart's death, there has been spreading through the "shopping" public a feeling that while the name was still there, the life and soul had departed. It had ceased even before that time to be, as it had for so many long years been, the one great "dry-goods establishment" of the American Continent. In fact, the somewhat pessimistic class of observers known as "old New Yorkers" were rather fond of predicting that the business, when taken hold of by "ex-Judge" Hilton, would be speedily ruined. Stewart's had been built up by that untiring industry and devotion to details which explain the rise of most modern industrial fortunes. Stewart himself knew "dry goods" as Laplace and Herschel knew planets, or as Rothschild knew the names on the backs of bills of exchange. Judge Hilton had had no training or apprenticeship in the business; and on the bench, as the bench then was, had had an opportunity of obtaining a much clearer insight into the ways in which the profits of lucrative business might be wasted and dissipated than into the best method of retaining or increasing them.

The business of Stewart's has indeed, ever since it passed into Judge Hilton's hands, been conducted in a most surprising way. The original acquisition of a concern supposed to be worth some $20,000,000 from the widow of the deceased owner by turning over to her the sum of $1,000,000, which had come to him as a legacy from her husband, looked, to be sure, like a shrewd stroke of business; but what it really displayed was ability rather of a financial than a mercantile sort. The hunt for the body of the late proprietor, which began about the same time, though it was a commendable proof of the fidelity of his friend and successor, can hardly have had a good effect on the business, for it caused the public to dwell unnecessarily on the fact that the founder of the concern was dead and gone, and that the business was being carried on by new hands. What was needed was the establishment of a complete identity between the old and the new in the minds of the public; and yet here was a continual and most painfully notorious kind of advertisement that Stewart had not only wound up his own business, but that his very body had taken the form of assets in the hands of rascals whom a lawyer like Judge Hilton might call executors *de son tort*.

Explanations of the causes which have led to the downfall of Stewart's trench, as any one may see from the interviews published with his successor on the subject and the general newspaper discussion, on rather delicate ground. The only great moral cause assigned, so far as we have seen, is the loss of the Jew custom, owing to Judge Hilton's order excluding the race from his hotel at Saratoga. How far there is any foundation for this may be open to dispute. There are no statistics at hand with regard to it; and, in a great Jew city like New York, the Jews themselves could hardly be expected to resist the opportunity afforded by such a striking event as the disappearance of Stewart's to exaggerate their importance in the social economy of the city. The antagonism between Christian and Jew in New York can scarcely yet be said to have assumed the proportions of a serious social problem; and when an Episcopalian congregation, forced out of its church by a fire, goes, as happened the other day, to worship temporarily in a Jewish synagogue, it can hardly be said that the fires of the old feud burn very hotly. Whether they burn hotly enough to have made the Jews *en masse* desert Stewart's because Judge Hilton expressed a desire to have them refrain from coming *en masse* to Saratoga, may be doubted.

It is more interesting to speculate for the moment over the causes which made Stewart's once great than to ponder over the true explanation of its decline and ruin. It was in its day a mighty store, a store the name of which was known in every American household or cabin from Maine to California. The name had pleasanter and tenderer associations than clung to any other store in the world, for it suggested the influence of woman. Stewart was the first shopkeeper who perceived the position which the two sexes on this continent were destined to occupy with regard to dress. Fifty years ago his keen insight into dry goods taught him that in the bright future which was opening for the race in America, the money devoted to dress would be mainly devoted to the clothes of women; that toil and labor, hitherto so selfishly imposed upon them, would now be mainly assumed by men, whose monotonous and ill-dressed lives would be made happy by the spectacle of the gorgeous dresses and bonnets and trimmings displayed by their wives and daughters, not tamely at home, but in the streets, in horse-cars, omnibuses, excursion boats, railroad trains, and hotel corridors. Stewart's was built up by the purely feminine passion for "shopping," which usually means buying dry goods under some one of the many forms they assume. Men, as everybody knows, not only do not shop, but detest and loathe the very idea—a trait which women usually attribute to stupidity, but which really comes from a lack of interest in dress. Nowhere is this so much the case as in the United States. Nowhere do men so entirely regard clothes as merely a protection against the climate, or a covering for the body prescribed by considerations of propriety. Clergymen and moralists have often used the spectacle presented by the professional hotel wife, with her five dresses a day, to point a moral as to display and waste, but the optimist may certainly derive a feeling of contentment in thinking of the other side of the picture—the unselfish husband, released, for the first day of the week, from the toil which produces all this beauty and luxury, to enjoy in his quiet and inexpensive garb the sight of what he has worked for. The unrestricted right to "shop" was undoubtedly first seized and developed by American women, and it was out of the development of this right that Stewart's grew. Where were the tailors, or even "ready-made clothes" men who could vie with him? They never existed, for the male demand did not exist.

Considering that it was woman who produced Stewart's, there is something melancholy in the thought that she should have taken up with the old European aristocratic notion that there was something degrading about the occupation which, in the last resort, makes shopping possible. It would seem as if the beautiful creature who purchases dry goods on one side of a counter, ought to have, naturally, a sympathy with the correlated male employee who measures them for her on the other. But, on the contrary, American women have always cultivated an aristocratic contempt for such occupations; and the romance of dry goods has been left altogether to the male mind. No romance unsupported by woman, however, could be perfect, and consequently the romance of dry goods which the career of Stewart undoubtedly suggested wherever the fame of his store penetrated, was of a somewhat sordid kind. It merely suggested to the young and ambitious that huge sums of money might be made in America through the appetite of women for dress, fed as it was by the devotion and docility of the American husband and father.

Finally, much as we must all mourn the disappearance of Stewart's from the surface of New York life, as moralists our regret cannot but be tempered by a feeling that its importance as an "institution," like all things that came down to the great New York of to-day from the little provincial New York of the period before the war, was somewhat exaggerated. It was undoubtedly a great store in its day, but that one of the chief capitals of the world should regard a big dry-goods store as one of its most unassailable titles to respect and consideration—that when asked what it had to show among the other cities of the modern world, it should, in the place of monuments of art and science, buildings or galleries, have triumphantly pointed to a dry-goods store, and proudly told the stranger who wanted to see what New York really was to go to Stewart's—was after all a little melancholy. Twenty years ago the disappearance of Stewart's would have been regarded as an irreparable public calamity. In the great city which New York has grown to be, the wreck makes one less among the old provincial landmarks, and the moralist may awake with cheerful surprise to the fact that after all it was not Stewart's that made New York, but New York that made, and unmade, Stewart's.

THE POLITICAL OUTLOOK IN ENGLAND.

LONDON, March 28, 1882.

THE political outlook is dark and cloudy, and persons who are not alarmists may reasonably look with deep anxiety on the prospects of the country. But pessimism is never wisdom, and any one who attempts to make any forecast as to the probable course of affairs must be careful to take into account the bright sides of a dark picture.

There never was a period at which Great Britain (I of course omit Ireland) was more distinctly than at this moment a country at unity with itself. Take any year from the outbreak of the great French Revolution to (say) 1850, and you will find that there then existed in one part or other of this island, and often over large parts of the country, bitter discontent, such as in 1882 is all but unknown. Carlyle's 'Chartism'; 'Alton Locke,' 'Yeast'; Disraeli's 'Sibyl'; every volume of Hansard, I might almost say every newspaper published at any date during the sixty years I have mentioned, bears distinct witness to a condition of society utterly unknown to the present generation of Englishmen, and which, were it suddenly to reappear, would make us all believe that the country was on the brink of ruin. The simple fact is, that reformers and philanthropists did at any time between 1832 and 1848 think the outbreak of revolution a probability, if not a certainty. All this is changed. We have no large discontented class unless it be the body of landowners. Loyalty to the Queen is the fashion. Like other fashions, it may change, but it is symptomatic of the prevailing sentiment. The Chartists have vanished. Many of the points of the Charter have indeed been embodied in acts of Parliament. But if the feeling which produced Chartism had survived, it would have expressed itself in some new form; it would probably have turned into Republicanism. As it is, even Mr. Bradlaugh, if he be a Republican, apparently thinks atheism more likely to be popular than dogmatic Republicanism. Change of opinion is due to change of circumstances. Men were Chartists because they were wretched. Free-trade, Parliamentary reform, the amendment of the poor-laws, the legal recognition of trades' unions, and a host of minor improvements in the law, which are themselves the sign of social and material improvements, have not removed all misery, but they have dulled the edge of discontent. Whoever turns from the poor and looks at the state of the middle classes, will see a breaking down of mere class divisions, which assuredly contributes to national strength. The universities, which were, not thirty years ago, the monopoly of a class and the centres of Toryism in Church and State, are now the universities of the nation, and command as much popularity as any institution in the land. This fact is well worth the consideration of every person able to understand its significance.

The country, again, despite temporary depression of trade and agriculture, overflows with riches. If any one can live in London and believe that he is not in the midst of the wealthy capital of a wealthy nation, he either cannot use his eyes, or cannot understand the meaning of all that his eyes tell him. The condition of affairs, moreover, abroad, is in some respects reassuring. The triumph of Germany did not produce anything like the benefit to mankind which some Liberals, with more hopefulness than wisdom, looked for from the success of the policy of "blood and iron"; but the overthrow of the Empire, the foundation of the Republic, the unification of Italy and of Germany, did undoubtedly lead to some results at which all Englishmen rejoice—no less for the sake of England than of the world. The Empire might pretend to be "peace," but it was in reality a menace of war to Englishmen hardly less than to Germans. The general course of events has, in spite of all the despots of Europe and their ministers, favored the spread of freedom and of good government. One proof of this is decisive: the foreign refugee, who for half a century justly excited the sympathy of Englishmen, is a figure of the past. The next generation will find it difficult to realize the sentiments with which their fathers and grandfathers regarded men such as Mazzini, Espartero, Louis Blanc, or Kossuth. When refugees are rare in England, despots, we may be sure, are becoming rare on the Continent, and the good government of continental Europe, which means nothing less than the happiness of the millions who inhabit it, may detract from the prestige of English freedom, but certainly adds to English security.

The important thing, then, is to make clear the nature of the signs which lead rational persons to foresee perils and to dread future calamities. First. There is something startling and ominous in the bitterness which, among the upper classes at least, political controversy is day by day assuming. No one can go into society without meeting with gentlemen who, not otherwise wanting in good sense, regard Mr. Gladstone and Liberalism generally with intense hostility. The existence of this feeling is to a certain extent accounted for by personal traits of the Premier's character. To analyze the reasons why Mr. Gladstone rouses something like animosity in the minds not only of Conservatives but of many Liberals, would itself require an article of some length. But it may be taken as a fact that strong and widespread as is his popularity with masses of the people, the Prime Minister is hated by many educated persons with a kind of abhorrence hardly felt by any one (within the memory at least of persons now alive) to Palmerston or Russell, or to any leading statesman of recognized capacity and of admitted high character. Nor is hostility to the Premier the sole sign of party bitterness. The courtesies of debate are becoming matters of tradition. Things are said in the House of Commons which would not be uttered in any meeting of ordinary gentlemen. No Home Ruler would say at a dinner table that Mr. Forster visited Ireland during the famine to enjoy the sight of Irish misery. The newspapers are beginning to follow the lead of the House of Commons. To write, with more or less circumlocution, that an eminent statesman and his son are born liars, is thought not unfitting by editors who mean to write for gentlemen, and claim themselves to belong to the class whom they address. Thirty or forty years ago as great or greater license of abuse was prevalent. Language was used of O'Connell which the organs of Conservatism would to-day hardly apply to Mr. Parnell; and any one who studies the political satire of 'Ten Thousand a Year' may satisfy himself that the amenities of political conflict were at least as much neglected in 1832 as at this moment. But the true remark that the rancor of partisanship was as rampant fifty years ago as now, does not, after all, mitigate the serious character of the new development of party spirit. For our fathers used in every department of life much more violent language than is now permissible in the society of persons with claims to humanity and good breeding; and fifty years ago England was passing through the crisis of a revolution. The bitter political feeling of the present day is a serious matter in itself, and is a sign of serious dangers to the prosperity of the country.

Secondly. Parliament is for the first time in English history working badly. The constitutional machine is out of gear. A Minister of unbounded energy is at the head of a loyal majority. He was put in power that he might carry through a body of reforms. There is plenty of work to be done, and Mr. Gladstone is the man to do it. Yet somehow or other nothing gets done. We are drawing on toward Easter, and the session has produced no results. This may be the fault of the Ministry, it may be the fault of the Opposition, it may be the fault of the Home Rulers. But whoever be to blame, the fact is certain that things have come practically to a standstill. It is also obvious that the Opposition have no wish to put matters right. They object to the *clôture* and they propose nothing in its place. To put the matter shortly, Parliament, or rather the House of Commons, has of recent years become more and more the government of the country, and now Parliament cannot discharge its work.

Thirdly. The temporary collapse of Parliament occurs at a time when there is the strongest ground for desiring that the Government of England should be able to command and use the whole force of the nation. There may at any moment be trouble in Egypt, and trouble in Egypt means difficulties with France; weakness may involve the most serious danger. But there is no need of looking so far afield as Egypt. The state of Ireland, or rather the relation of Great Britain to Ireland, is enough to fill even a confirmed optimist with forebodings. This, however, is a matter on which, more than on any other, it is necessary to avoid exaggeration, and to see that, as the saying goes, "the saddle is put on the right horse." Bad as the condition of Ireland is, it has undoubtedly at different periods within this century been worse. In 1828 and 1829, from 1841 to 1845, and again in 1848, there was far more ground than at present to fear armed conflict which might amount to civil war. Armed conflict in Ireland might, moreover, have then involved foreign war. A slightly different turn of affairs in France might during 1848 have provided Irish nationalists with French allies. From perils of this kind England is now completely free. Your readers can tell far better than I what may be the amount of help which the leaders in an Irish rebellion could obtain from America. But my own conviction is that, whatever politicians may say to catch the Irish vote, there is not the remotest reason to suppose that under the present state of affairs the Union, or any large party in the Union, would give aid or sympathy to Irish revolutionists. To speak the whole truth, I doubt whether Irish grievances receive from the mass of Americans the attention or the sympathy which in my judgment they deserve.

The perils of the time are not Irish insurrection or foreign intervention. The dangers which fairly excite alarm arise from the difficulty experienced by Englishmen in dealing with the state of Ireland. Coercion is, as every one now sees, a temporary makeshift, not a permanent policy. To rule by means of Coercion Acts is like governing by means of a state of siege. The device is effective for the moment, but every month which it lasts increases the difficulty of returning to the orderly reign of regular law. I do full justice to the good intentions with which the policy of coercion was begun. I dare not even assert with confidence that the policy was, with all its fatal defects, one which could be avoided. All that I do assert, and this without hesitation, is that the policy of governing by means of arbitrary arrest cannot last. The problem before the Government is how to enforce law and to protect life in Ireland by just, by regular, and by legal means. I do not believe the problem to be without a solution, but one may say with certainty that no leading statesman has pointed out a satisfactory solution for the adoption of the nation. Meanwhile, the further and even more pressing problem is how to carry through the agrarian reforms enacted in the Land Act, and prevail on the English public to wait patiently for their result. That efficient administration may do a great deal to protect life and property in Ireland is, if the whole art of government is not a delusion, certain. That no device which the human intellect could devise or human energy carry out can provide an immediate or speedy cure for Irish misery, or for Irish discontent, is certain. Patience, and almost

infinite patience, is the virtue needed before all others by any statesman called upon to take part in the government of Ireland; and the vital question of the time is whether the English nation, or rather the majority of the English electors, can show a kind of self-restraint and patience not always found even among statesmen and philosophers.

Fourthly. The difficulties of England arise much less from accidents of the day than from some peculiar characteristics of English public life and popular sentiment. There exists a want of harmony between the constitution of the country and the spirit of the governing classes. The Conservatives, under the leadership of Mr. Disraeli, hurried on the advent of democratic rule. The Constitution is at bottom a democracy veiled under monarchical and aristocratic forms, just as, during the eighteenth century, it was an aristocracy concealed under monarchical and popular forms. The people, or in other words the electors, are in the last resort sovereign. Their will gave power to the Conservatives in 1874; it installed Mr. Gladstone in office two years ago. A distinct change in the sentiment of the constituencies would involve a change of government. Yet, though the electors reign and occasionally rule, they do not as yet govern. They do not even give the tone to the actual Government. The governing classes are aristocratic, wealthy, conservative; and it is, in the main, through members of these classes that the administration is, and as things stand must be, carried on in England. The gradual establishment of a more or less democratic Constitution has not led to the spread of anything like democratic sentiment through the main body of well-to-do Englishmen. Hence what I have termed a want of harmony between the theory and the working of the Constitution. The "sovereign people" (to use a foreign expression) is at once served and governed by men who, whatever their own views, belong to a society which is aristocratic and plutocratic. Hence perpetual incongruities. Constituencies of artisans are represented and wish to be represented by lords. Great landowners or their sons hold, or are supposed to hold, opinions leading to the subdivision of property. The political leaders of the people are almost of necessity men who do not share or avow the sentiments of the social world to which they belong. This was as true of Lord Beaconsfield as of Mr. Gladstone. It will, I suspect, for a long time be true of every premier destined to exercise influence among the electors.

Hence, in the main, the prevalence of the constant misunderstandings between "Society" and the "people." Mr. Gladstone's talent, energy, and high principle, are in reality doubted by no one. But the very features in his character which displease the governing classes captivate the constituencies. The series of lay sermons by which he won the Midlothian campaign would certainly have never raised him to power if office had still been really in the gift of the House of Commons. They exactly hit the taste of Scotch Presbyterians and English Dissenters, and these classes proved strong enough to turn the election. The exercise, again, of democratic power through aristocratic agents, which is the marked feature of the existing English Constitution, all but necessitates the unpopularity of the Government with the classes from which it is taken. Mr. Gladstone, Lord Hartington, even Mr. Bright, appear to wealthy Englishmen something like traitors to their class. Persons of conservative instincts, whatever be their party names, are annoyed and alarmed at the deference of the Government to popular sentiment. When, years ago, Mr. Lowe denounced the "flesh-and-blood" argument, he hit the point in Mr. Gladstone's character which will always offend a large body of educated Liberals. At the present moment, men whose taste has long been offended fancy that their property is in danger. American critics of the Land Act will easily understand why Mr. Gladstone's agrarian legislation excites at once the fears of landowners and the censure of strict economists. The dread of attacks on property is, I am inclined to believe, for reasons I may perhaps give in another letter, not much better than a panic. My present point, however, is simply to notice that the measures which offend the governing classes certainly do not offend the electors. The Duke of Argyll's onslaught on the principles of the Land Bill commanded a good deal of sympathy even among Liberal M. P.'s; but no one has ever alleged that the tenant farmers of England or of Scotland were stirred to wrath by the economical errors of the Land Act. I doubt whether the Duke's speeches were admired by his own tenants. Some American young gentlemen have, in a recent book of travels, expressed their surprise that Englishmen do not by "one manly stroke" establish institutions suited to a democracy. This is not so easy a matter as our youthful critics fancy; but they deserve some credit for hitting one weak point in the state of the country. There is a want of harmony between the form of our institutions and the spirit of English society.

There is, again, something curiously uncertain in the state of public opinion. A whole set of political dogmas have half lost their hold on popular belief, while new views and sentiments have hardly as yet obtained the consistency of firm opinions. Two examples will best show my meaning. Throughout the whole sphere of foreign policy, including in that term the treatment of subject races such as the Hindoos, public opinion is, so to speak, at sea. Englishmen still feel that the power of England must be maintained. They also feel (and in this too they feel rightly) that it is not for freemen to play the part of tyrants or aggressors. Hence a singular fluctuation from one extreme to the other. A fit of Jingoism is followed by a fit of humane sentimentalism, and wise men may fear that humanitarianism may at any moment be succeeded by reckless national self-assertion. What is needed is a general conviction that some settled line of action is in principle right; but this conviction certainly does not now exist. Throughout the whole of our recent dealing with Ireland may be seen just the same conflict of beliefs, each of which contains truth, but neither of which has been properly adjusted to the other. The law must be maintained; life and property must be made safe throughout the whole of the United Kingdom. These are truths past dispute. Irishmen are our fellow-citizens; they have as much claim to representation as any other class; they are the best judges of Irish interests; it is not for Great Britain to rule as a despot over Ireland; above all there must be no bloodshed—the scenes of 1798 cannot be reënacted, even under the most mitigated form, in 1882. These, too, are truths which no man of sense, of humanity, or of insight, can deny. The difficulty is, how to reconcile more or less inconsistent convictions. After the English fashion we are trying to reconcile them in a manner which men fancy to be practically sensible because it is known to be theoretically indefensible. The resource of civilization is arbitrary arrest tempered by discretionary humanity.

A. V. Dicey.

THE POSITION OF THE MONARCHY IN ENGLAND.

London, April 9, 1882.

The Queen has, as your readers probably know, a large family—four sons and five daughters. It is held to be the duty of the nation to provide a competent livelihood for each of them, and accordingly when each of the sons comes of age, and when each of the daughters marries, application is made to Parliament for a grant of money to support the independent establishment which the prince or princess has thenceforward to maintain. At first there was no thought of opposing these applications. But latterly they have awakened some displeasure, and have been resisted in the House of Commons by a section which, though numerically small, is resolute and is increasing. Each occasion has a certain interest and importance as allowing people to give vent to feelings of impatience with our present form of government and its expense—feelings whose existence close observers have long been aware of, but which it is the fashion to deny or ignore. To what extent those feelings prevail, or what is the force they exert, are questions much disputed and hard to answer confidently. They are, however, so significant as to redeem from triviality a discussion over a vote of so small a sum as £10,000 a year. That is the sum which the Government last week proposed should be given to Prince Leopold, the Queen's youngest son, in contemplation of his marriage, and in addition to the annual sum of £15,000 which he already enjoys. The vote was opposed in the House of Commons by Mr. Labouchere, the colleague of Mr. Bradlaugh in the representation of the ultra-Radical constituency of Northampton; by Mr. Broadhurst, one of the two workingmen who sit in Parliament; by Mr. Healy, known to you as an Irish Nationalist peculiarly virulent in the expression of his hatred to England; and by Mr. Storey, member for Sunderland. The two last-named members, by the tasteless language in which they dealt with the question, displeased their own side as well as the audience generally, and probably diminished the number of their supporters. Only forty-two were found to divide against the grant, but a good many of those who usually support the Government refrained from voting, making thereby a sort of silent protest against a proposal which they did not like to resist openly.

The minority might probably have been larger were it not that Prince Leopold is personally acceptable. He is a well-conducted young man, and with higher intellectual tastes and capacities than his brothers; and it was felt that it would seem unfair to refuse to him what had been granted to them. However, the numbers on such a division in the House of Commons are no trustworthy evidence of the strength of sentiment on the subject in the country. The House of Commons is composed (with very few exceptions) of persons belonging to the upper and upper middle class persons who are under the influence of the opinion of what is called Society, and who would find it disagreeable to outrage that opinion, even if they were not themselves, as they nearly all are, in sympathy with it. Besides, there are some persons of a speculative turn of mind who, while objecting to a monarchy in the abstract, do not care to raise a large question on what they would call the paltry issue of a grant of £10,000 to a prince. So that altogether the proportion which the forty-two members who voted against the grant bears to the total number of members of the House of Commons (at present 652) is not necessarily any measure of the strength or extent of the popular sentiment on the subject.

What, then, is the feeling in England regard-

ing the ancient monarchy? In attempting to describe it, I must admit that it is a matter about which the fairest and keenest observers differ, so that you must not take what is said for anything more than it professes to be, a conjecture based on considerable opportunities for observation.

One thing, however, is certain: our feelings toward the monarchy have quite changed within the last seventy years, even within the last thirty. Everything is now an open question in England, everything is matter for discussion, on which people may think and speak as they like, without fear, not merely of the law, but of any social ban. There is no longer that reverence for existing institutions simply because they are existing, no longer that belief in the British Constitution as the most admirable result of human wisdom and the special favor of Providence to Britain, which filled and controlled all but the boldest minds in the earlier part of this century. The Crown, the House of Lords, the Established Church, are now all put upon their defence, and required to give a reason for their continuance. Even that sentimental loyalty toward the person of the sovereign which we see, for instance, in such a man as Sir Walter Scott, has almost vanished, at least from among men, and, so far as it remains, remains only because the present sovereign is a woman. There will be none of it felt toward the Prince of Wales when he succeeds to the throne. In other words, those who value and stand by the monarchy now do so chiefly either from habit, the strongest of all reasons with most people; or from a prudent unwillingness to make a change unless they can be convinced that it will be an improvement; or from self-interest, from the belief that the monarchy is bound up with the existing aristocratic system of this country, whose maintenance they for their own personal satisfaction desire. The sceptical tendencies of our times, the example of France, the very fact that the present sovereign has lived in such retirement during the last twenty years, have undermined the old disposition to accept the monarchy as a natural and necessary part of the established order of things.

When one proceeds to inquire in which classes of the community the attachment to it is strongest, one is not surprised to find the motive of self-interest operating most powerfully in the richer people. They are at once the best pleased with the existing state of things, and the most sensitive to rumors of a change. They think that the rights of property are in danger, and look upon what they call "the democracy" with serious apprehension. They conceive that the landed aristocracy and the capitalists must now stand on the defensive, entrenching themselves behind those institutions which can best resist a revolutionary movement. The Crown appears to them to be such an institution: if it can hardly be called a stronghold, it is at least a rallying point. Its existence is totally opposed to those notions of equality which they dislike. The ancient forms and ceremonies of our court, however hollow the philosopher may think them, have a certain fascination for those who come near them, and whose ambition it is to obtain an office in connection with the court, or to be noticed by a member of the royal family. Besides, the homage paid to these "illustrious persons" appears to the nobility to be similar in nature, while of course greater in degree, to that which the Peers themselves expect from their dependants; they therefore relish it, and consider it legitimate. Although many of them see that if the throne were removed, the power and dignity of a great peer would at first be more conspicuous than it now is, they believe that the levelling process would go on to attack hereditary titles, perhaps even overgrown estates. Thus, taking all these grounds together, the nobility and the wealthy generally are all well affected to the Crown, and would stand by it if it were assailed.

When one comes to the so-called middle classes, the merchants of moderate fortune, the professional men, farmers, and shopkeepers, there is not so much difference of view as might have been expected. Among the richer members of the middle class there are many who seek to confound themselves with the upper; they imbibe its sentiments, imitate its habits, use and sometimes even exaggerate its language. This is especially the case in London, in Liverpool, and in what are called "county towns"—towns overshadowed by the territorial magnates of the neighborhood. And the middle class as a whole, being prosperous, is contented; it finds England a good country to live in and has little desire for sweeping changes. It is satisfied with the monarchy as (on the whole) it is with the rest of the Constitution. It has perhaps even more respect for the sovereign than the aristocracy have, just because it is further removed from personal intercourse with the sovereign's family, and is less mortified at the feeble maintenance of court festivities since Prince Albert's death. Setting great store by the domestic virtues, it values the present Queen for the rigid decorum which has marked her whole reign. On the other hand, our middle class is a practical and common-sense sort of class, which tries to look at things as they are. It has now come to think the Crown rather an ornamental than a substantial part of our system of government. It acquiesces willingly in it so long as it confines itself to ornamental functions, and gathers in crowds to applaud a prince when he comes down to Leeds or Glasgow to open an exhibition or lay the first stone of a science college. But there is only one part of it which has any positive interest in, or affection for, royalty. That part is the feminine part. To women of the upper-middle, as well as of the upper classes, whose interests are chiefly of the social order, the doings of the Queen and her family are a subject of great curiosity and sympathy. They buy photographs of them; they like to read how they were dressed at such and such a state ceremonial; they think it an honor to be presented at court. To them, as to the country clergy, the word republicanism has still a shocking sound, and seems near akin to atheism. Their influence, though one may call it sentimental, is not to be left out of sight in estimating the forces that make for and against the throne.

It remains to consider the working classes; and here the difficulty of discovering the truth is greatest, not only because they are less articulate than those above them in position, but also because they differ in different parts of the country. In some places—in the Lancashire towns, for instance—a good many are conservatives, and these of course profess ardent loyalty to the sovereign. In the rural districts they are only now beginning to have political opinions at all, for our agricultural laborers are, with few exceptions, still excluded from the Parliamentary franchise. But in most of the great centres of industry—in London, in the towns of Yorkshire, Durham, and southern Scotland, in Birmingham and the iron country—the more intelligent section of the workingmen, those who govern the votes of their companions, have become, if not actively hostile, yet distinctly averse to the monarchy. There can hardly be said to be a republican party. Candidates for Parliament are not yet asked if they will vote for the abolition of the throne, as they are asked to vote for the extinction of the House of Lords or the Established Church. But the notion has spread widely that a monarchy is a mere survival from the middle ages—a survival of little practical use; a survival which is injurious to the rights and interests of the people, not so much in itself as because it helps to maintain the whole aristocratic and plutocratic system of English government and society.

Of course the workingman does not put the question to himself in any definite formula of this kind; but this is what, in a vague kind of way, he is thinking. It is characteristic of England that the first practical expression he gives to his feelings is by complaining of the cost of royalty. Although all the sums paid out of the public treasury to the Queen and all her children and relatives are trifling when compared with the cost of the Army, for instance, or the Navy, they seem prodigious to an artisan who is accustomed to support his family on from five to seven dollars a week. He does not realize the countless artificial wants and forms of expenditure which social preëminence brings with it, and thinks it monstrous that Prince Leopold should receive from the taxes, to which he himself contributes, more money in each day than would keep a workman's family for a whole year. Together with the admiration which the English have for rank and wealth, there is among the bolder spirits of the working-class some murmuring at the luxury in which the great live, as compared with their own laborious lot. There is no advocacy of any violent interference with the rights of property; but why, they ask, should a useless court be pampered out of the earnings of the poor? Such notions have not yet spread very widely or obtained any great hold. They show no signs of becoming dangerous to the stability of the Constitution. They will hardly grow to importance until or unless the theoretical republicanism which exists among educated politicians allies itself with this practical impulse toward equality and economy which prevails among the masses. No one can say when that union may take place. If the next sovereign leads a life as correct and decorous as that of the present Queen has been, and is as careful, perhaps more careful, to avoid showing any political sympathies, the throne may stand unshaken for a long while to come. Its weakness is its strength. No one has any active interest in destroying it. Levellers are more hostile to the House of Lords and the landowning system than they are to it; some of them even value it as keeping the great nobles in a second place. Sensible men feel the advantage of having an office which has a certain permanence, which is removed from the storms of popular passion and the angry criticisms of party leaders. Scientific students of our Constitution, like the late Mr. Walter Bagehot, have insisted with great force and truth that the abolition of the Crown would involve a number of other changes which no one is prepared to work out.

On the whole, therefore, it may be concluded that, although republicanism will continue to grow in England as a matter of theory, the time is still distant when it will become a subject of practical discussion. But if any monarch should quit the attitude of prudent isolation from political struggles which the late and the present sovereign have generally observed; if any Minister should succeed (as Lord Beaconsfield sometimes seemed inclined to try) in committing the Crown to a support of his own schemes, and uniting its fortunes to those of his own party, it would soon be seen how vast have been the changes since the days when George the Third was able to baffle Chatham's wishes for concession to the American colonies, and Pitt's plans for the pacification of Ireland. The roots of the monarchy have shrunk and withered; a strong blast might bring the old tree to the ground. Fortunately for a country which has so many

other difficulties to meet, it is still the general wish to shelter it and prop it up as long as we can. Y.

THE PRECURSORS OF THE RENAISSANCE.—II.

PARIS, March 30, 1882.

WE have followed with M. Muntz the steps of the precursors of the Renaissance. It is very interesting to follow him also in the study of the reaction which took place against this great intellectual movement. This reaction is not very well known, and one of the chief actors in it was a man who remains still problematical—the famous Savonarola. All parties have claimed him in turn among their supporters—the partisans of theocracy, the champions of democracy. Italy, as soon as her unity was complete, raised a statue to him in Ferrara, which was his birthplace. In Germany you will find him, at Worms, at the foot of the Luther monument, as if he had been a precursor of the Reformation. Meanwhile the order to which Savonarola belonged asks for his canonization. Was he orthodox? was he a heretic? "Adhuc sub judice lis est."

M. Muntz treats this interesting subject from a new point of view; he studies Savonarola in his relations with the champions of the great artistic and intellectual movement of the Renaissance. When Savonarola arrived in Florence the Renaissance was in full bloom: sciences, letters, arts, everything had been renovated. Under these influences, it must be confessed that a certain sort of epicureanism had taken possession of Florence. The city of the Medicis had become almost a pagan city; still, the Christian influence was not destroyed. It was the time when Leonardo painted in Milan his famous "Cenacolo"; but the mixture of Christian and of mythological ideas was visible everywhere—in the works of Ghirlandajo, of Botticelli, of Pallajuolo, of Filippino Lippi; in the writings of Poliziano, of Pico della Mirandola, of Landino, of Pulci. Marsilio Ficino tried to reconcile the teachings of Plato with the dogmas of Christianity.

The triumph of the Renaissance had been completely pacific; its champions had suffered no persecution, had inflicted no persecution. The new ideas sprang out of the old Italian soil like flowers in the spring; the germs scattered by Rome and Greece came suddenly to life, and there is nothing so striking in the movement of the Renaissance as a certain sentiment of youth, of happiness, of comfort, of hope. The soul, unfettered and unchained, seems to plunge into a sea of infinite felicity. It must not be supposed, however, that the new doctrines could be received without some resistance. There are in all times stubborn defenders of tradition, guardians of the old foundations of society. The first voice heard was the voice of Father John of San Miniato. He dared to say that the study of the pagan poets was dangerous for youth, and the Chancellor Salutato Coluccio had to take up the defence of these old poets. Another monk, Giovanni Dominici, attacked the writers of antiquity in his 'Lucula Noctis'; he said that it was wrong to speak of the gods of mythology. Even Pius II., the refined Æneas Piccolomini, became afraid of this return of the old gods, and, tolerant as he was, he nevertheless reproached Sigismondo Malatesta for having converted the Christian Church of San Francesco in Rimini into a sort of pagan temple. He reproached him also, and not, it must be allowed, without reason, for having dared to inscribe on the monument of Isotta the inscription, "Divæ Isottæ sacrum."

The successor of Pius II. was Paul II.; he learned that some of the members of the Academy founded by Pomponius Lætus and by Platina had exchanged their Christian names for Roman names, and he blamed them publicly. Botticelli learned, to his cost, that he could not trifle with the Christian dogmas. One of his friends, Matteo Palmieri, in a poem called "The City of Life," had accepted the ideas of Origen, and admitted that some of the angels had remained neutral between God and Lucifer, and that they had become human beings. Botticelli wished to illustrate this idea on the walls of St. Peter the Greater. Rio describes his work in these terms: "It is impossible to look without some sort of bewilderment on these three parallel ranks of angels who witness the Assumption of the Virgin together with the patriarchs, the prophets, the apostles, the martyrs, with all the glories of the ancient and of the new Law. But neither this new profession of faith nor the beauty of the work could supply what was wanting in point of orthodoxy; by a measure very rare in the annals of painting, the picture was covered with a veil and interdicted." Botticelli's "Assumption" is now in Scotland, in the castle of the Duke of Hamilton.

Savonarola became the exponent of the reaction against neo-paganism; he looked with distrust and contempt upon the old civilizations of antiquity; he denounced the follies and the crimes of the Greeks and Romans. "In matters of faith," said Savonarola, "any old woman knows more than Plato." He did not positively proscribe all the ancient writers; he thought that Homer, Virgil, Cicero might be put in the hands of young men, as well as Saint Jerome and Saint Augustine, but only in the latter years of their education.

"Among the ancients," said he, "there were poets who despised what was ignoble, and who exalted the actions of generous men; they made a noble use of poetry, and I will not and ought not to condemn them. However, the best poets of paganism ought only to be studied after a solid catholic education. . . . I take it that Christians ought to be chiefly distinguished by their good conduct. It is better to have a less brilliant eloquence than to become, with much eloquence, unworthy of the name of Christ."

Savonarola denounced the imitators of antiquity, whom he accused of a want of originality: "O imitatores, servum pecus."

"There are," he said, "pretended poets, who, following the footsteps of the Greeks and Romans, keep the same metre, invoke the same gods, use only the words used by the ancients. We are not made on a different pattern from the men of old time; we have received from God similar faculties so as to give to things which vary every day variable names. But the poets I am speaking of have made themselves such slaves that they can only say what has been said before them, and they repeat it in exactly the same terms."

Savonarola paid more attention to literature than to art. M. Gruyer has with much patience collected the 'Words of Savonarola on Art,' but these extracts leave a very vague impression. Savonarola mentions no painter, no well-known picture; he is completely wrapped up in moral considerations—he sees in art only a form of theology. He accuses the new schools of the Renaissance of having reëstablished the worship of old and pagan forms and ideas, and he accuses it also of realism, which, in his eyes, is the opposite of mysticism.

The great artists, Botticelli, Verocchio, Pallajuolo, and their friends loved to paint the naked forms of humanity; Savonarola objects to their introduction in the churches. "The figures represented in churches are the books of children and of women. We ought not to have fewer scruples than the pagans. The Egyptians did not allow anything indecent. . . . Aristotle, who was a pagan, said in his 'Politics' that one ought not to paint immodest figures, on account of the children. . . . What shall I say to you, Christian painters, who represent such figures? I beseech those who have them in their houses to have them whitewashed and defaced." The sermons of Savonarola were followed by an *auto-da-fé*, by *bruciamenti* of works of art. Some of his admirers were artists, such as Bartolommeo della Porta and Lorenzo di Credi, who sacrificed on the Piazza della Signoria the beautiful drawings which they had made from the model. In these *bruciamenti* all sorts of objects were destroyed—foreign tapestries, from Flanders, probably, with their coarse figures; portraits of Florentine ladies, cards, instruments of gambling, musical instruments, mirrors, such books as the works of Petrarch and Boccaccio, the 'Morgante' of Pulci, the poems of chivalry. Crowds assembled around these great fires: the *bruciamenti* were great popular festivities.

Savonarola had an æsthetic theory: in his eyes, art ought to be purely spiritualistic; he condemned naturalism, realism. "The works of nature," he declared, "are finer and more perfect than the works of art," but art has not for its object an impossible imitation; it has ethical aims; it must prefer expression to beauty—look for the beauty of the soul and not for the beauty of the body. "Take," says he, "two women of equal beauty, one good and virtuous, the other leading a dissolute life. You will see, on the features of the first, the marks of an almost angelic beauty; the second, notwithstanding her charms, will not bear comparison." Some passages of his sermons show well the social state of Florence; the painters introduced in their frescoes all sorts of portraits of living people. Ghirlandajo, in his frescoes of Santa Maria Novella, painted twenty-one members of the Tornabuoni and Tornaquinci families.

"You sacrifice still to Moloch," said Savonarola; "that is to say, to the Evil One. What are the fashions at Florence? As soon as women have married their daughters, they show them with ostentation; they dress them like nymphs; and they take them to Santa Liberata. They are the idols you have placed in my temples. The figures which you paint in your churches are the figures of your gods; and the young men, pointing to such and such a woman, say: 'There is Magdalen—there is Saint John,' because you paint in the churches images of this one or that other one, which is a grave insult. . . . Do you think that the Virgin Mary was dressed as you represent her? I tell you that she was dressed with simplicity, like a poor woman, and that she hardly showed her face. Saint Elizabeth, also, was simply dressed."

The religious forms of art did not lose anything by this teaching. The Convent of San Marco was the cradle of a mystic poetry which filled Florence with marvels. Many artists accepted the austere programme of Savonarola; and it is one of the greatest charms of Florence that it shows everywhere a Christian art side by side with an art inspired with the spirit of antiquity. What greater contrast can there be than that between the 'Perseus' of Benvenuto Cellini and the celestial figures painted in the silent cells of San Marco? Savonarola was not inimical to art, but his conception of it was narrow. He would not have converted Florence into Geneva, says M. Muntz; he would have converted it into a Mount Athos, with hieratical and traditional forms, like the great Byzantine figures of Christ, of Mary, of Peter and Paul. He hated all forms of luxury; he proscribed all the gold crucifixes, all the books of devotion adorned with miniatures; he was ascetic in the highest degree. Fra Angelico, who adorned the halls and cells of the convent of Savonarola, tried to soften his coloring. He was as ascetic as a painter can well be, and we read on his epitaph:

"Non mihi sit laudi quod eram velut alter Apelles,
Sed quod cuncta tuis munera, Christe, dabam."

Correspondence.

FICTION FOR SCHOOL CHILDREN.

To the Editor of The Nation:

Sir: As implied in your note on the annual report of the St. Louis Public-School Library, we have had less trouble with the fiction problem than most other libraries. A great aid to the partial solution obtained has been the elimination in large measure of the element of expense by means of our "collection of duplicates"—a separate department of the library, supplied chiefly with popular fiction, from which books are issued to members at a charge of five cents a week per volume. This collection has always been self-sustaining, and of late years a source of increasing revenue. Any one interested can find a detailed account of the plan in the *Library Journal*. Not having the *Journal* at hand, I cannot be sure, but think it appears in vol. ii. It can be readily found by reference to the index, under my name.

Yours respectfully,
Frederick M. Crunden, Librarian.

Experiment Mills, Pa., April 15, 1882.

POLAND AGAIN.

To the Editor of The Nation:

Sir: I have read with much gratification the able article in the *Nation* of April 6 on Poland. The writer correctly assumes the importance of Poland in the great European war which, begun in the Crimea, was so inopportunely interrupted to suit the purposes of the French Emperor. But on one point your writer, in common with nearly all writers, seems to me to want insight: He appears to look upon the question as one concerning monarchs only. As such, he may be right in his intimations of probable policies. But he has left out the mightiest factor in the coming settlement—the republican party throughout Europe, quiet enough, nay, I would almost say, dead (indifference is death) at present, yet certain to rise again so soon as our rulers have their hands full. It is the fear of this that occasions wars to divert the popular mind and waste the peoples' vigor, that compels peace when war might go too far. If Mazzini was right (and I believe he was) in his insisting that the question of our day is the assertion of nationalities in place of heterogeneous kingdoms, I think it must be seen that no new kingly arrangement—not even including a king for a king-limited Poland—will give a lasting peace to Europe. It is not a new political division after outworn patterns, and under the auspices of reigning families, that will content the peoples, however satisfactory such temporary arrangements would be to the houses of Romanoff and Hohenzollern—I dare not add, of Hapsburg. Kings of Greece and Servia and Poland, tributary to the all-devouring "Panslavist," will not save Austria. The logic of history is sure as the mill-work of the gods. Austria, built up of uncombining materials, was built but to be broken. The unity of Italy assured us of that. France, greedily annexing Nice, gave warrant to Germany to seize back Alsace and Lorraine. Does not the same logic require that Germany take also her own from Austria, and that consequently Germany in turn must relinquish Posen?

Underneath all monarchical leadings and misleadings, under all political calculations, lies the fear of the nascent national life, *which can only be republican*. Kingly Poland! The whole brood of Stanislas and Czartoryski is effete and below contempt. Poland's heroes are republicans: Konarski, Darasz, Worcel, the preachers of the republican faith throughout all Europe. For this did they become exiles. The partitioning of Poland was the first step toward the disenthronement of the partitioners; and not of them only, but of those who only held their clothes and looked on. Poland is indeed the one indispensable factor in the settlement of the Eastern—say, rather the European—question. The Crimean War was a mistake. Not the war, but the seat of the war. Had England's rulers cared for anything except the policy of the hour; had they cared for right and England's honor, they had sent our army to the north, and, with a republican Poland, checkmated the Czar. Only that had not suited our "good ally," had been indeed as a proclamation of the European Republic, fruit on the blighted promise of 1848; and what English Government, however "Liberal," has any leanings toward republicanism? Your writer recognizes the Polish necessity; does he also see the certainty and necessity of a republican Poland?

I string together only a few random remarks as provocation for thought, not daring to intrude more upon your space. W. J. Linton.

New Haven, April 13, 1882.

[The "republican party throughout Europe" is not dead, not even apparently so; but it does not appear to us destined to be "the mightiest factor in the coming settlement" between Slavs and Teutons, the probabilities of which, as arising from present political combinations and national propensities, our article considered without regard to postulates of reason and justice.—Ed. Nation.]

COMPETITIVE EXAMINATIONS FOR PASSED ASSISTANT SURGEONS.

To the Editor of The Nation:

Sir: In reply to your correspondent in the *Nation* of March 30, in regard to the above question, allow me to occupy space enough to state the following. Your correspondent appears to admit that he knew he was to compete in his examinations with his classmates, and that his standing or precedence would be given accordingly; that competitive examinations are strong incentives to study, professional zeal, and in fact to general excellence; that in a learned profession the method pursued in the examinations in vogue for nearly fifty-nine years so successfully (judging by the previous notorious inefficiency of the medical corps of the Navy) is the only present practical way of obtaining properly qualified medical officers for the Navy, and of determining their relative merits; and that the system of competitive examinations so long pursued, and by which some thirty men obtained their relative leading positions on the Navy list by fair trial, is now overthrown by a legal technicality pure and simple, leaving the questions of right intention, principle, and honor entirely aside.

These are simply unadorned facts. As to the question of fairness, and opportunities for study dependent upon station during the first three years of our service and between the two examinations, let me cite two well-known instances, the records of which are at the Navy Department, Washington. The two leading agitators, in whose names all this matter is carried on, in both examinations (different examiners in each, when fresh from the schools, and again when home from their three years' service abroad) did no better than attain the minimum sum of marks or numbers necessary to pass and *be in* the service; in both examinations coming out at the foot of their respective classes. These two men, preceding their second examinations, made sea cruises to stations where other men similarly situated came home and took the heads of their respective classes—these latter finding no lack of hospital facilities, study, or books. In fact, with but few exceptions, the men who were found to take high numbers relatively to their classmates (a class is made up of all who enter in any one year), in their examinations for admission into the service, usually kept their positions on their second examinations for promotion, three years later. The earnest student and qualified man holds his own, according to the records at the Bureau of Medicine and Surgery in the Navy Department. This probably accords with the universal experience in educational matters. The influential conniver obtains, by a decision based upon a legal technicality given by Attorney-General Devens in March, 1881, and acted upon by the Navy Department in January, 1882, that which he fails to attain by his merits. His conduct may be liable to a court of inquiry; for do not such actions come under the general laws relating to "conduct unbecoming an officer or a gentleman"? Your correspondent, and the two men above indicated, go up on the Navy list many numbers—from the foot to the heads of their respective classes—by the success of this questionable scheme, their zeal in *this* instance bearing rich though rare fruit.

The passage of Senate Bill No. 414, introduced by Senator Lamar, and entitled "A Bill in relation to Passed Assistant Surgeons in the Navy," would prevent this injustice and compel the Navy Department to keep its promises to us. We were induced to enter the Navy by fair-speaking circulars—holding out rewards for zeal and study; and now, after (in some instances) eleven years, to be set back in rank and grade from one to five or more years, with corresponding loss of pay and emolument, and by the perversion of the spirit and intent of the law and custom of nearly fifty-nine years, is disheartening in the extreme. Our bill merely seeks to give us by statute incontrovertible what the Government promised and gave us for many years. There is no money in it, and it is intimately concerned with civil-service principles—about which the sentiment of intelligent men of all parties does not differ. For all these reasons, we hope for justice from Congress sooner or later. C. A. S.

April 13, 1882.

THE CHINESE QUESTION.

To the Editor of The Nation:

Sir: For the first time since I began to read the *Nation*, I find myself out of sympathy with its views on a great public question. The subject of Chinese immigration is a very important one, deserving, I think, more attention than the *Nation* has given it hitherto. Nor can I help thinking that the instincts of the "great unwashed" are in this case correct.

The Chinese Bill recently vetoed by the President was an outrage, for it violated treaty obligations but recently assumed and plainly understood. But the question whether this particular bill is a desirable one, and the question whether we had better regulate—or, if it threatens to become too large, prohibit—Chinese immigration, are very different; and the latter, in my opinion, should be answered in the affirmative as vigorously as the former in the negative. We should not pass laws in violation of existing treaties, but we may secure the modification of such treaties in a proper way, and then take such measures as our interests demand.

Chinese immigration should be prohibited, because—(1) the Chinese do not assimilate readily with our population; (2) they are of a civiliza-

tion so different from ours, and of political, religious, and ethical traditions so different from ours, that wherever they settle in considerable numbers the "conflict of races" begins; (3) their standard of life is so much lower than that of ours that they cannot but influence our laboring population unfavorably; (4) economical and social difficulties would grow out of their continued immigration which would seriously threaten the existence of our political institutions; (5) the United States Government is utterly powerless to protect the interests of such Chinese as do immigrate from the attacks which their presence invites wherever they settle, without a radical change in the theory and practice of Federal interference.

Even if none of the above points deserve consideration, yet the following one certainly does: The Chinese have come to California in not very great numbers; immediately, a "Chinese question" appears, which, although local in some respects, has yet become national in many others. The State government is either unwilling or unable, or both, to protect a large class of its citizens from violent personal assaults from other citizens; the Federal Government is equally powerless. The same elements which have produced such a condition of things in California stand ready to produce the same condition in every other locality where the Chinese shall settle. Shall we shut our eyes to these facts, and try to meet them with "glittering generalities" on our duty to the oppressed races, on the fact that "the spirit of our institutions is the spirit of freedom," and on our duty to convert and Christianize the heathen? Are we ready to solve the "Chinese question" when it starts up, not three thousand miles away in San Francisco, but in New York, Boston, Philadelphia, Charleston, New Orleans, St. Louis, and Chicago? We cannot solve it now; what shall we do then? My conclusion, then, is that it is far easier for us to keep out the Chinese than to solve the social, economical, and political difficulties which their presence among us will create.

What are the objections to prohibiting it? It is urged that it is contrary to our traditions to prohibit immigration. On the contrary, we have always proceeded on the theory that we had a perfect right to keep out every class of immigrants which was likely to prove injurious to us. We have repeatedly sent back to Europe criminals and paupers who had been sent here to get rid of them. We prohibited the slave-trade, which was not much worse than the coolie-trade. Besides, up to this time we have had no such question as this of Chinese immigration to deal with. The immigration *en masse* of a race radically different from us in language, institutions, and laws, on an entirely different plane—mentally, physically, and morally—and of different religion and traditions, with a tenacious persistence of type and no desire to be assimilated, is something entirely new in our history, and we can consequently have no tradition in reference to it.

It is also urged that the Southerners might say, "You are now taking our old position, when we said, in regard to the negro, this Government is a white man's Government." I have no objection to admit this, though I should say in reply, "This question is an entirely different one." If the Chinese were here in great numbers, and the question should arise, Shall they receive the right to vote? I should reply, "Yes! Give to those now here all the rights that any of us have. It is the only way out of a bad fix." But if the negroes had all been in Africa, and the question had been, Shall we allow them to immigrate? I should have answered No! as now in the case of the Chinese; and for the same reasons, although there are objections to the Chinese that would not be good against the negro.

It is further urged that our material development could proceed faster with Chinese cheap labor than without it. This may be, but it has been one of our national mistakes so far that we have considered everything from the standpoint of our material development. Shall we, for the sake of a few more miles of railway a year; for the sake of a few millions more of gold and silver yearly; for the sake of a large increase of corn and wine, allow an element to be introduced into our society which will greatly increase the friction in our political machinery, which will endanger the very thing for which, after all, our fathers fought and our brothers and neighbors died—our political liberty and our civilization?

A further objection is made, that if we shut out the Chinese, we shall lose the Eastern trade. This statement would be hard to prove; but, if proved, should be answered as the preceding one was.

A last objection is, that if we shut out the Chinese, they would shut out our Christian missionaries, who are doing so much to convert them to Christianity. To which I would reply, to the Chinese—Your blood be upon your own heads; to the missionaries—You can find work enough at home.

I should be glad if the *Nation* would give us something more elaborate upon this topic.

Yours very truly, E. J. James.

Normal, Ill., April 10, 1882.

[1. The first generation of no race of immigrants assimilates readily with our population, particularly if they do not speak English. The first generation neither of Irish nor of Germans has so assimilated. 2. The conflict of races caused by the Chinese is nowhere so serious, or ever likely to be, as that caused by the presence of the negroes at the South; the cure tried in that case was not expulsion, but enfranchisement, and it seems to be succeeding. 3. The low standard of living of the Chinese, as an argument for exclusion, is no stronger against them than against all other foreign laborers. The standard of all the newcomers has been lower than that of those already settled here, and has been the principal reason of their coming. No immigrant could succeed here, at first, if his wants were not fewer than those who had preceded him. This is especially true of the Irish. 4. No new economical difficulties are likely to arise out of the presence of the Chinese. The economical difficulty caused by the unwillingness of the Caucasians to be outbidden in the labor market is a very old one. The solution which is proposed in the case of the Chinese would be welcome everywhere to the class which is here hostile to the Chinese. There are no laborers who like competition. 5. We cannot say whether the United States are utterly powerless to protect peaceable foreigners, because they have never tried. Until they have tried and failed, it is hardly becoming for them to legislate in such manner as to enable the separate States to evade their constitutional obligation to protect the life and property of all dwellers within their borders. Roughs "stand ready" to assault and rob peaceable people in every part of the Union. The Government, however, does not meet this readiness by advising the peaceable to go away and not provoke them, but by erecting jails, organizing courts, and keeping up police and militia. There is no surer way to incite violence than publicly to acknowledge that it is reasonable or natural or inevitable.

It is not true that we have ever kept out any class of voluntary immigrants because they were willing to work for low wages and lived frugally. The pauper, idiot, and coolie illustration therefore has no application to the present case. Moreover, there has been no Chinese immigration "*en masse*," and, according to the best judges, there is no likelihood of anything of the kind. There has been a very small Chinese immigration, to a region in which there was practically no labor but Chinese labor to be had, and in which it was sorely needed and very useful. Therefore legislative preparation for an overwhelming Chinese invasion seems absurd. It is not impossible that we may within twenty years be engaged in a bloody war with two European powers, but it would be very foolish to keep up a large standing army in preparation for any such contingency. Preventive legislation, especially if it be of a novel kind, which does violence to long-established principles, should be based on strong probabilities, not on remote possibilities.—Ed. Nation.]

Notes.

It appears from a circular issued by Houghton, Mifflin & Co. that Samuel Colman, of this city, published an edition of Longfellow's 'Hyperion' in 1839, but that the John W. Lovell Company, whose cheap edition we noticed last week, have not exactly followed Coleman's, but have, by embodying later copyrighted corrections, made themselves liable to an injunction by Mr. Longfellow's executor. In the meantime, Houghton, Mifflin & Co. have promptly brought out fifteen-cent editions of 'Hyperion' and 'Outre-Mer.'

During April, T. Whittaker will issue a special cheap edition of S. Baring-Gould's readable memoir of Robert Stephen Hawker, 'The Vicar of Morwenstow.' It will be well printed, and bound in substantial paper covers.

A. D. F. Randolph & Co. publish immediately 'Faith Victorious,' a life of Dr. Johannes Ebel, Archdeacon of the Old Town Church, Königsberg, Prussia, by the Rev. J. I. Mombert, D.D.

Robert Carter & Brothers have issued a tasteful uniform edition, for the library, of the works of Hugh Miller, in six volumes. The first and best of these contains portraits. Bayne's 'Life' and the 'Autobiography' are here side by side with Miller's literary, theological, and scientific productions; and it can hardly be doubtful that the personal element in this series has the most enduring interest as well as value.

The fifth and last volume of the "Geoffrey Crayon" edition of Irving's 'Washington' (Putnams) is now procurable. Besides Washington himself, his four immediate successors are represented in steel engravings, as are also Rufus King, Oliver Ellsworth, and Oliver Wolcott, and the distressing Crawford monument at Richmond.

"Margery Deane's" 'European Breezes' (Boston: Lee & Shepard) is a chatty book, in which the writer does not always remember how narrow is the distinction between the lively and the flippant—*e. g.*, such reflections as, "I would like to have been Goethe's mother" can be of value to nobody. On the other hand, the sketches of life and manners in Hungary are novel, piquant, and entertaining.

'The Appledore Cook Book' (Boston: Andrew F. Graves) will be welcomed by the public which the author, Miss Parloa, has created for herself through her lectures and classes. Its peculiarity is the use of measures rather than of weights. 'The Complete Cook Book,' by Catherine Stuart (New York: W. B. Smith), has a novel feature in a chapter on "The Serving of Wines." 'The Household' (Detroit *Free Press* Co.) is that *omnium gatherum* of which the table of contents will always excite a smile, for the grouping of such heterogeneous subjects can never be anything but absurd. Still, books of the kind fill a place in the family, and this is as inclusive as the best of them.

Lucy B. Hunt's 'Hand-Book of Light Gymnastics' (Boston, Lee & Shepard) is a brief and extremely compact description of exercises and marching figures, of which last many are new, intended for class use in girls' schools. The book is made by an intelligent and practised teacher; but it is to be regretted that brevity has been sought at the expense of illustrations, which in a manual of this kind are particularly useful. The verbal description of an attitude or a movement is a longer and a less satisfactory thing than the simplest pictorial description or diagram, even for skilled teachers. There is a good chapter on the dress most suitable for light gymnastics; the material recommended is coarse twilled flannel, with a thin cambric lining for waist and sleeves. The gymnastic suit, which is carefully described, can be made from this for less than four dollars. A not unnecessary warning against high-heeled shoes and tight corsets concludes this very practical little manual, of which our main complaint is that it is too brief.

Mr. Thorvald Solberg's 'Catalogue of Books and Articles relating to Literary Property,' or bibliography of copyright in its broadest sense, began to be published in the *Publishers' Weekly* for April 8. No less than eighty-eight authors are enumerated up to the name of H. C. Carey.

We have received the prospectus of the *New Education*, a monthly journal issued by Thomas W. Bicknell, Boston, hitherto associated with the bi-monthly *Education*.

There is a sermon worth studying in the mere series of faces of the pastors of the Trinitarian Church, New Bedford, Mass., exhibited in the pamphlet account of the semi-centennial celebration of that religious organization. Fifty years would hardly be expected to reveal so great a change in the mere physiognomy of the clerical profession—a change implying much.

'England and the Northmen,' by J. R. Green, a work complementary to his 'Making of England,' is said to be already in the press.

The latest brochure issued by the Deutsche Gesellig-Wissenschaftliche Verein of this city is entitled 'Ueber die Volkswirthschaftlichen Fragen in den Vereinigten Staaten,' by J. Schönhof. The Society was founded in 1870, and members meet once a month, from September to June, to discuss literary, economic, and general topics, and listen to lectures, the most important of which are printed and distributed among the members.

'Bluntschli and his Contributions to Political Science' is the title of No. 161 of the current *Deutsche Zeit- und Streit-Fragen* (Berlin: Carl Habel). The author is Dr. Franz von Holtzendorff. This little brochure contains a speaking likeness of Bluntschli, and an imposing array of names appended to an appeal for aid in founding a Bluntschli Institute "für allgemeines Staatsrecht und Völkerrecht." Dr. von Holtzendorff, Munich; Dr. H. Schultze, Heidelberg; Dr. A. von Orelli, Zürich; and Dr. A. Rivier, Brussels, will receive contributions to that end.

Parts 14, 15 of the new Brockhaus (New York: L. W. Schmidt) complete the first volume, but not the letter A, which is cut in two at *Arraroba*. Physical maps of Africa and South America, and a political map of the former continent, with plates of Egyptian antiquities and of the Aquarium, adorn these numbers. Characteristic of this work are the numerous titles relating to labor and the labor problem (*Arbeiter und Arbeitslohn* to *Arbeitsschulen*).

Just a year ago Dietrich Reimer, Berlin, published his splendid map of Central Italy, as edited by Henry Kiepert, in four sheets, on a scale of 1 : 250,000. The same house now sends us a smaller but not less beautiful map, likewise in four sheets, and also edited by H. Kiepert, representing the section embraced in the former map (*i.e.*, from Lake Bolsena to Pæstum) and all the rest of the peninsula southward, besides Sicily and Sardinia. In this new map archæology is disregarded, it being, in fact, mainly a reduction of the new topographic map prepared by the Italian Staff (*Stato Maggiore*), with a change of scale from 1 : 50,000 to 1 : 800,000. A side-map shows enlarged the Province of Naples and the bordering districts. Neatly folded within covers, this map recommends itself to every tourist in Lower Italy as full, authoritative, and convenient.

At the late sexcentenary of the Sicilian Vespers (March 30) a work was to be published upon which Signor Borri has been engaged for a number of years, a history of Sicily from the peace of Cattabellotta, where Amari's 'Guerra del Vespro Siciliano' ends, to the death of Frederic III. in 1347. And the Sicilian Historical Society (Società di Storia Patria) promised a very interesting work—a collection of all the traditions that can be collected in Sicily relating to the Vespers.

The Bishop of Como has set up a little private index expurgatorius. The journal *Il Baradello* having in some way displeased him, he has caused a circular letter to be read in the pulpit ordering the faithful not to read the journal under pain of falling into mortal sin, nor to aid its publication in any way. He has, in fact, excommunicated *Il Baradello*, or, in plain Irish, boycotted it.

—A portrait of Frau Materna is prefixed to an article on "Music and Musicians in Austria," in the May *Harper's*, which is timely in view of the impending arrival of the great Wagnerian vocalist-actress in this city to sing in the concerts of the May Festival. There are fifteen other portraits, among them Richter, Hellmesberger, Walter, Bianci, Wilt, Marchesi and Eduard Strauss. Why not Johann, the waltz-king and operetta composer? Brahms is also a conspicuous omission. The article itself, which is almost entirely concerned with Vienna, the musical metropolis not only of Austria but of the world, is written in that rhapsodical style which is still considered by many as "the thing" in musical literature, and for which Liszt's 'Chopin' is largely responsible. There is much interesting information, however, about the opera (which, like the Philharmonic concerts, has no superior anywhere), the popular concerts of Strauss and others, chamber music, leading singers, instrumentalists, teachers, etc. Ronacher's restaurant deserved mention as a unique resort, in which seven of the best bands play on successive days of the week, admission being free, excepting on Sundays. Several statements, which are hardly matters of opinion, call for correction. Jäger is not the "inimitable *Siegfried*," Vogel and Winkelmann being universally regarded as his superiors in that rôle. There are no "cadenzas" in the "Walküre." "Kolossalische" seems to be a new word. It is well known that Materna and Brandt are the greatest dramatic vocalists of our age, but on page 831 it is stated that Frau Wilt is probably the most dramatic singer the world has ever known. Six lines lower we read of her voice, that it is "astonishing mechanism, but a heartless, soulless voice"! This is only equalled in absurdity by the statement that Scharwenka "made the mysterious sickness of Chopin health. But who can imagine Chopin in health?"

—"Two on a Tower" is the singular title which Mr. Thomas Hardy gives to his new novel, which begins in the current *Atlantic*. Mr. Hardy has always had a fancy for combining sensationalism of situation with a "low" tone in treatment, and "Two on a Tower" promises to show this combination, for those who like it, in perfection. Sir Blount Constantine, an insanely jealous husband, has left his young and beautiful wife in England, while he has gone off on a two years' trip to the centre of Africa. To relieve his jealousy, she has volunteered a vow to live in absolute seclusion during his absence, which she has thus far with difficulty kept. Meanwhile she receives a mysterious letter to the effect that her husband, instead of being in Africa hunting lions, has been seen in London in very peculiar circumstances. About the same time she discovers that a sad young man, of great beauty and great astronomical ambition, has established himself with a telescope on a tower, where he is taking observations to furnish data for a work on variable stars. The astronomer and lady develop a good deal of sympathy for one another, and he explains astronomy to her in some of its more emotional aspects. There is nothing of the flirt about either of them, but the situation is one which suggests flirtation to the wordly-minded reader. After a few days of astronomical work, Lady Constantine comes to the conclusion that she must send somebody to look after her husband and see whether he is in London, and, of course, hits upon her new-found astronomical friend as the very man for the mission. He agrees, reluctantly, to go, provided she will watch a certain very important star for him and record her observations. So he goes off to dog her husband's steps, while she remains in charge of his telescope—a nice situation for the wife of a jealous man, under a vow of seclusion, to put herself into. And here chapter iv. of "Two on a Tower" ends. The only poetry of much interest in the May *Atlantic* is Mr. Longfellow's "Mad River." The sentiment of the verses is of the simplest—a child's song could hardly be simpler—and were it not for Mr. Longfellow's recent death, they would perhaps hardly have been printed. As poetry they are not to be spoken of in the same breath with the wonderfully touching verses—not intended for the public, but printed, nevertheless, the other day in the *Independent*—on his wife. If there is not much poetry, there is plenty of prose in this number of the *Atlantic*. The most strictly readable article, notwithstanding the subject, is "The Arrival of Man in Europe," by John Fiske. There is a huge attractiveness in the speculations of anthropologists when popularized which corresponds with their general repulsiveness before the popular stage is reached. Babes and sucklings like to be told that it is just about 80,000 years since the glacial period came to an end, and when to the knowledge of this fact is added the information, derived from some apparently simple astronomical calculations, that this same period began 240,000 years ago, making the glacial period 160,000 years long, there is every reason for the most ignorant reader to feel well pleased with himself. Further he may learn from Mr. Fiske's article that at the beginning of this little epoch men were living in the valley of the Thames; that at the end of it all the River-drift civilization had disappeared, and been supplanted by the more advanced and æsthetic Cave-men.

Then came the swarthy Iberian, and then the blue-eyed Aryan, with whom, of course, we feel comparatively at home. The third instalment of "Studies in the South" is rather too statistical to be interesting. Mr. Harrison is so much better as an observer than as an economist that we cannot help hoping that he will go back in the next to his first manner.

—The February number of the *American Magazine of History* bears for the first time the names of Messrs. B. F. De Costa and Henry P. Johnston as editors. Its opening article, "Morton and Merry Mount," by Mr. De Costa, presents the "lord of misrule" in a new light—indeed, in that of a martyr—and furnishes a fagot for the roasting of Bradford, Winthrop, Nathaniel Morton, Prince, and the rest of the Pilgrim and Puritan historians, all of whom have stigmatized Thomas Morton as a rogue and a nuisance. We hesitate to accept Mr. De Costa's conclusion that "it is undeniable that Morton became an object of aversion largely for the reason that he used the Prayer Book." It may not be denied that the man was harshly treated, but that he was oppressed because of his religious principles is contrary to all the record evidence. The statement that Morton had a "patent" for his "nest" at Mount Wollaston, inasmuch as it "does not appear to have been recognized by any writer heretofore," requires more evidence than Mr. De Costa has favored us with. In 1630, the year of Morton's second arrest and deportation, the Massachusetts charter most certainly covered Mount Wollaston and the country adjacent. That there was any "patent" for the land earlier than the Massachusetts one is more than doubtful. It is nearly certain there was none. The note relating to the 'New English Canaan' indicates that the first edition of that amusing book was printed without a date, but probably in 1634. The 'Bibliotheca Americana' (London, 1789), however, places it under 1632, and as by Thomas Moreton. Lowndes's reference to the Gordonstoun copy applies to its catalogue number (1634) and not to its imprint. Col. Dongan, "The Great Colonial Governor," makes a grand subject for the pen of P. F. Dealy, S. J. Strangely enough, the name of Dongan has escaped almost all the biographical dictionary makers; and yet, according to Mr. Dealy, Dongan "prepared the way for all that is most admirable in the constitution and policy of our great republic." Mr. Johnston writes upon "The Secret Service of the Revolution," and Mr. Henry B. Carrington on "Valley Forge"—a portrait of Major Tallmadge illustrating the one, and an etching of Washington's headquarters the other article. Mr. J. Carson Brevoort throws some "New Light on the Verrazzano Voyage of 1524," and promises to return to the subject in a future number of the magazine. An extract from the diary of Col. Ebenezer Storrs will serve to strengthen the position taken by Dr. J. N. Tarbox and other historians, that Gen. Putnam was the commander of the American forces at the battle of Bunker Hill. Storrs led a company of Connecticut troops in that battle, and writes, June 17, 1775: "About 10 went down to ye Hill to Genl Putnam's Post, who has ye command." We can commend this magazine to all who feel interested in American history, believing they will find in every number (judging from the promise of the present) an abundance of curious information pertaining to that subject.

—In 1878 several officers of the Army stationed in the vicinity of New York conceived the idea of forming a Military Service Institution, somewhat on the plan of the Royal United Service Institution which has so long existed in London. Its object was the reading, discussion, and publication of papers on subjects of interest to the military service, and the establishment of a national military library and museum. The professional utility of such an institution does not admit of question, but it was feared that the great dispersion of our small army would offer a very serious obstacle to its success. Fortunately this has not proved to be the case; its membership, which until now has been confined to officers of the Army, has reached the number of 710, or one-third of all the officers in active service, and it is proposed hereafter to admit ex-officers by ballot; its fiscal affairs are in an excellent condition; it has comfortable and well-arranged rooms on Governor's Island, and its library and museum are rapidly becoming very valuable. Each year a prize of a gold medal of suitable value, together with a certificate of life-membership of the Institution, is offered for the best essay on a given subject. For 1880 the subject was "Our Indian Question," and the successful essay, by General John Gibbon, attracted wide attention. For the current year the subject is "The Improvements in the Art of War during the Past Twenty Years," the award for which has not yet been made. The first number of volume iii. of the Journal of the Institution has just been published, and its contents are fully equal to the standard of the Royal United Service Institution. The number contains a translation, by General Weitzel, of part of the twentieth and concluding number of the admirable History of the War of 1870 by the Prussian Staff, a judicious and comprehensive discussion of "The Sabre and Bayonet Question," by Lieutenant Bigelow, a paper on "Army Wagon Transportation," by General Holabird, and the picturesque story of "Mina and His Three Hundred" (in Mexico in 1817) by Captain Potter. It also contains well-written criticisms of current military literature, and the whole number is particularly creditable in view of the small number of years that the Institution has been in existence, and the difficulties with which it has had to contend. Now that it may be considered as firmly established, it will doubtless prove with each year a still more valuable factor in the professional education of military officers.

—"X" writes us from Cincinnati:

"Permit me to call attention to a curious literary coincidence—of no great consequence, perhaps—which I have not yet seen referred to in print. It is that the *motif* of Mr. Anthony Trollope's latest story, 'The Fixed Period,' may be found in a play of Massinger's entitled 'The Old Law.'"

—From uncritical reliance on the old *trovère* Robert Wace, Mr. E. A. Freeman has put forth, as though an indisputable fact, what is, if not entirely fictitious, at least highly problematical. Roger de Montgomery, he asserts ('Norman Conquest,' vol. iii., chap. xv., §4), commanded, under William the Conqueror, one of the three divisions of the army that fought at the battle of Hastings. For particulars, relegating this assertion, pretty conclusively, to the realm of pure poetry, we must content ourselves with referring to a detailed article in the current issue of the *Palatine Note-book*, a publication now in its second year, of which the sterling value continues to be conspicuous. It would, indeed, be a matter of just surprise if, with any heed for evidence, Mr. Freeman could substantiate even the position that Roger de Montgomery was associated with the Conqueror at all in the invasion of 1066.

— The Germans have laughed for ten years over the blunder committed by the Frenchman who translated the word "Generalstab" by "le Général Staff," and who gave long descriptions of this famous officer. If German were only more generally known in France, there would be now a good opportunity for retaliation. In the March number of the German review *Auf der Höhe* is a description of the salon of Madame Adam, in Paris, translated, as the editor states, from the French by a German. The text is: "Man kann gleich sehen dass man in einem republikanischen Salon ist, obgleich Céans Maîtresse von der Königin von Spanien empfangen worden ist" (One can see at a glance that he is in a republican salon, though Céan's mistress has been received by the Queen of Spain). Who is this Mr. Céan of whom Madame Adam is the mistress? is the natural question, and it is doubtful whether anybody, no matter how well acquainted with Parisian scandal, will be able to answer it. But translate the phrase into French, and the mystery ceases: "On peut voir tout de suite qu'on est dans un salon républicain, quoique la maîtresse de céans (the lady of the house) ait été reçue par la reine d'Espagne." One is reminded of Lafontaine's fable of the monkey who mistook the Piræus for a man. Let us hope that Madame Adam will not bring an action for libel.

—Old-fashioned teachers of languages are sometimes tempted to rebel against the tendency, which seems inseparable from modern scientific methods as followed in this country, to enlarge on the grammar at the expense of the vocabulary. The objection that a school-book has a large vocabulary is simply fatal to it in the judgment of many progressive teachers, and that in the face of the fact that, for all practical purposes, the vocabulary is the main thing, as Mr. Lowell, himself a professor, emphasized in a recent lecture to English workingmen. The slenderest stock of grammar, indeed only so much grammar as one can pick up for one's self, will suffice for much literary enjoyment; and many scholars who are accomplished grammarians within a certain range know this and act on it when they leave their familiar haunts. So when one wishes to make out a Dutch or Danish sentence, a Dutch or Danish dictionary is all that is needed. And yet in the study of the classics the vocabulary of teacher and scholar is all the time getting narrower and narrower. "Etymology gives the key." Yes, but the key is never turned. French teachers, who of late years seem to have become fully alive to all that is going on in the educational world, are not disturbed by the fear of burdening their pupils with lists of words, and two little books have just been put forth by M. Bréal, professor at the Collège de France, and M. Bailly, professor at the Lycée d'Orléans, which are intended to combine what is good in the old plan with what is good in the new. The *cours élémentaire* of these 'Leçons de Mots' contains a list of Latin words arranged according to their sense; the *cours intermédiare*, a list of Latin words arranged according to their etymology, with elementary notions of formation, derivation, and composition of Latin words. M. Bailly is a teacher of high rank; M. Bréal is a man of world-wide reputation, whose familiarity with educational problems has not impeded his work as a scientific student of language. France is fortunate in having so many earnest philologians of high attainments, who work along the whole line in the patriotic effort to advance the standard of education. Elsewhere elementary work is too often left to mere compilers.

—A distinguished European jurist, Professor Goudsmit, of the University of Leyden, died on the 10th of March last. He held for nearly twenty-five years the chair of Roman law, and wrote many treatises of great value and importance. His principal work, on the Pandects, has been translated into English. Professor Goudsmit had many friends in this country,

which he visited about eight years ago. What makes his life and his work interesting to English and American jurists is that it shows clearly of how much value the study of Roman law, rightly understood, can be even in countries where the actual law is founded to a greater or less extent on a different basis. German professors, in their lectures and books, are too often compelled to go into tedious details concerning the works of Justinian, as being still part of the law of the land. In France, on the other hand, nearly all the time is devoted to the study of the Code Napoléon; Roman law is considered at best a means of elucidating what exists, not as an instrument of reform. In Holland the conditions are more favorable to the student of jurisprudence. Roman law, as law, was expressly abolished in 1806, and till 1838 the Code Napoléon was in force; but in that year a new code was introduced, which pretended to be a national work, but which was in reality very defective. It is, of course, necessary to devote part of the five years which form the usual course of study in Holland, to the elucidation of the law as it stands; but the great merit of the work of Professor Goudsmit has been that he wanted his students to consider not merely the knowledge, but the improvement, of the law as the ultimate object of their labor. He followed the critical method in expounding Roman law. Nothing was taken for granted, but the origin and nature of every principle, and its applicability to our modern state of society, were discussed. His books are works on comparative jurisprudence, not merely treatises on Roman law. The same method might be applied with profit in other countries by those who wish to understand thoroughly and reform successfully the existing law.

—With Saturday's concert the New York Philharmonic Society brought its fortieth season to a close. The concerts have been characterized by the usual excellence and even balance of the instrumental forces, by a judicious choice of vocalists, a conscientious and spirited interpretation under the command of Mr. Theodore Thomas, an admirable perspective and variety in the arrangement of the programmes, a due regard for novelties as well as for the old classic repertory, and by intelligent, large, and appreciative audiences. The Philharmonic concerts, in a word, have been what they should be—the most enjoyable of all the entertainments offered to lovers of good music during the whole season. The last concert was a fitting termination of the series. It included Beethoven's overture, "Die Weihe des Hauses"; a concerto for pianoforte by Hermann Goetz; the romanza, "Unter blühenden Mandelbäumen," from Weber's "Euryanthe"; Vorspiel to Wagner's "Lohengrin"; and Schubert's Ninth Symphony. The orchestral work was excellent throughout the evening, revealing no less Mr. Thomas's appreciation of all the telling details of his score than the peculiar electric nexus which seems to exist between him and every member of his orchestra.

—The Goetz concerto was new to New Yorkers, but it is a favorite in England. Indeed, the almost unanimous approval which this young composer's works have met with in England is something quite unique in the annals of music. He died at the early age of thirty-six, after a hard struggle against poverty, and after having composed, besides this concerto, a symphony, one opera and two-thirds of another, together with some chamber and pianoforte compositions. His first opera, "The Taming of the Shrew," has been produced with great success in more than a dozen German cities as well as in London, where the spirited acting and singing of Minnie Hauk secured for it the same popularity that it enjoys at Vienna with Lucca, and at Berlin with Lili Lehmann, in the leading rôle. The success of this opera is all the more significant because its greatest admirers cannot help admitting that when he wrote it Goetz was not in his proper element, the real comedy spirit being conspicuously absent in his score, and the finest passages those where the action for the moment assumes a tragic or serious aspect. In his leanings and aspirations Goetz belongs unmistakably to the "Siegfried" and "Meistersinger" period of Wagner, although he makes no use of leading motives, and uses the wind instruments more sparingly than others of his school. The concerto in B flat is characterized by the same features as his opera—seriousness of purpose, clearness of form, an abundance of fresh though not highly original ideas, a certain rhythmic monotony, quiet instrumentation, avoidance of trite phrases, and also a clear comprehension of the scope of a pianoforte in a concerto. The piano part was played by Mr. Hermann Rietzel in a very acceptable manner, and the composition as well as the soloist earned much applause. The concerto is a welcome addition to the society's repertory, in which it deserves to keep its place for some time. Signor Campanini sang the romanza from "Euryanthe." He did not sing it so well as on Friday afternoon, and received more applause when he came on the stage than when he left. Philharmonic audiences are much more critical than those listening to Italian opera. Through the persistent efforts of a score of admirers he was recalled, and sang "Winterstürme wichen dem Wonnemond," from "Die Walküre." His voice, with all its beauty, is too feminine in quality to give such songs with the proper manly dignity and simple expression. Instead of blending his voice with the orchestral parts, he sang like a soloist, compelling the conductor to watch for his slight but annoying rhythmic vagaries, which impeded the proper swing of this voluptuous music. The Schubert Symphony and the two overtures were beautifully played. The movements of the Symphony are all characterized by what is technically known as "divine length"; which means that they are not too long after all. The truth is, there are few symphonic movements by any modern composer, Beethoven included, that are not over-elaborated, and this fact is one of the best arguments in favor of the modern symphonic poem, as a musical form which offers less opportunity to composers for prolix writing than a symphony in several movements.

THE STORMING OF FORT GRISWOLD.

The Battle of Groton Heights. A Collection of Narratives, Official Reports, Records, etc. With an Introduction and Notes by William W. Harris. Revised and enlarged, with additional Notes, by Charles Allyn. New London: Charles Allyn. 1882. 8vo, pp. 399.

So far as the people of Connecticut have taken part in the seven years' cycle of centennial celebrations which is now nearly complete, they have only emphasized that practice, which some have thought an American eccentricity, of celebrating their defeats. But if it happens that no British army was routed upon Connecticut soil, the reasons for it are themselves a sufficient cause for pride to the citizens of that stubborn little Commonwealth. The beehive of industry, of frugality, of accumulation, of high organization that it was then not less than to-day, was a dangerous enclosure into which to thrust an attacking or plundering hand. To an extraordinary degree, indeed, the flower of her people was defending the common cause at a distance from her own hearthstones. A greater proportion of her population went to the forces of the Confederation than from any other of the colonies; a greater number absolutely than from any colony but one. From Quebec to Savannah, there is hardly a siege or a battle in which Connecticut courage and fortitude were wanting; but there was neither battle, properly speaking, nor siege within her borders, and no hostile force ever slept a night upon her soil. The raid of Tryon upon Danbury in 1777 was repelled with such vigor by the swarming farmers that the three nights which his troops passed on shore were spent in the torment of marching and fighting, and not in rest. The successive dashes upon New Haven, Fairfield, and Norwalk two years later were ended each upon the day it was begun, by a retreat to the ships. And the first and last shot of Arnold's "military execution" at New London were both fired between sun and sun of that one summer day, the 6th of September, 1781.

Not one of these enterprises can be regarded as having any organic relation to the general development of the war, or any substantial influence, except a moral influence, upon its result. Each of them was an episode, the story of which might be told almost completely without referring to the existence of a general war between the confederated colonies and Great Britain. The first was a mere dash for the destruction of stores; the second sought also to strike terror into an especially rebellious community by an impression of ubiquitous and irresistible force; but the last was impelled by the further motives of a wish to effect a diversion from the movement to Virginia which culminated, a few weeks later, in the surrender at Yorktown, and a wish to inflict vengeance upon a nest of privateers perhaps the most mischievous upon the Atlantic coast. And it may well be doubted whether any one event in that seven years' struggle, which certainly was not wanting in various elements of poetry and romance, was richer in heroic material than the twelve hours' incident of the mouth of the Thames. It was as well worth celebrating as anything that happened a hundred years ago. It seems to have been worthily celebrated; and now both the event and the celebration have found a worthy record in the volume whose title-page is partly given above. In some respects, indeed, the work may be called quite the ideal of its class. A brief historical sketch presents the situation at the moment the expedition was undertaken, and introduces contemporary newspaper accounts of the event, seven narratives of participants or witnesses, the official reports of the several British commanders, and a collection of extracts from public archives, lists of killed and wounded, biographical sketches, etc., so full as to seem exhaustive. It is, however, a circumstance significant of the completeness of the disaster that befell the Americans that no official report upon their side seems to have been made, for no officer was left to make one.

With a detailed account of the celebration of last September—the orations and the poems, the sermon and the prayers—the volume closes. And when we have added that the editorial work is done with a modesty of self-suppression almost excessive; that the book is manufactured at the Riverside Press with its accustomed accuracy and beauty; and that it is illustrated with ample and admirable views and maps, we have sufficiently called attention to the book itself. But we are unwilling to dismiss its subject without adverting to an accepted opinion which appears plainly, from the complete record here presented, to be mistaken and unjust.

The wound inflicted upon Connecticut by the New London expedition was not only deep, but it was a very sore one. The expedition was under the command of the most infamous, as he was one of the most brilliant, of the sons of Connecticut. Benedict Arnold, who had led the onslaught upon Tryon's columns at Danbury in 1777, and who knew well, therefore, how such raids should be managed, led now the descent upon his native county. The destruction of the little city of New London by the column which landed under his immediate command upon the west side of the harbor, was wanton and useless, and if justified by the instructions under which he acted, certainly was not justified by any military consideration. The slaughter which befell the little garrison of "embattled farmers" was enough, apart from all circumstances of special exasperation, to embitter the souls of that simple and quiet community for many a generation. There is a pathos difficult to resist in the mere roster of the homely names of the "people that jeoparded their lives unto the death in the high places of the field." Let it not be forgotten that all who had got together in Fort Griswold, upon the confused and half-understood alarm of the enemy's approach, including the little company that rowed over from the abandoned Fort Trumbull, and including Andrew Billings, who climbed up a rope through an embrasure after the gates were finally shut, were but 155; that of these eighty-eight were killed and forty-three wounded; that of these 131, all but twenty-six were dwellers in that farming town of Groton in which the fight took place, while all the rest were near neighbors to it; that nine Averys were killed and six wounded, six Perkinses killed and three wounded, all from Groton; and some adequate notion may be got of the bitterness of grief which came upon the households whose firesides these fathers and brothers had fallen in defending. No wonder that the fresh grave-stones with which the burying-grounds were shortly filled, the inscriptions upon which are copied complete in this work, should bear a dismal uniformity of denunciatory rage. "Inhumanly massacred"; "British cruelty"; "British barbarity"; and, more often than any other phrase, "Traitor Arnold's murdering corps"—these and like expressions often, though not always, indicate the indignant anguish which refused to be comforted, because they were not.

Undoubtedly, if the massacre of the garrison of Fort Griswold, either upon the assault or in cold blood, had been commanded or even intimated, the execution would have been quite to the taste of the Fortieth and Fifty-fourth Regiments. But with the utmost detestation of the war waged against the colonies, and the utmost sympathy and admiration for the noble little band which held the place so manfully, we are compelled, upon a careful review of this record, to the conclusion that if the expedition to New London was a justifiable enterprise, the slaughter at Groton Heights was an inevitable, and therefore justifiable, incident of the expedition.

Fort Griswold was a little bastioned work, admirably situated upon a hill commanding New London harbor from the east. It was armed with no less than thirty-five pieces of artillery; its garrison of something over 150 men, although fewer than could have been desired, was yet capable of an efficient resistance; and its supply of ammunition was so ample that there were captured after the fight 800 stands of grape, several thousand round shot, and 10,000 musket cartridges. This garrison, during the morning hours, was vigorously preparing itself for a threatened attack; was indeed manfully challenging attack, by opening fire from its eighteen-pounders upon the enemy's columns across the river, and was receiving reinforcements until the last moment that the gates could be left open.

It is perhaps conceivable that a main object of the expedition might yet, without the capture of the strongest point about New London, have been attained. But the reduction of a stronghold is no less legitimate an object of warfare than the destruction of stores or shipping; and to reproach the British for their determination to take Fort Griswold would be absurd, if it be conceded that they had a right to attack New London. Against it, then, they set in motion a force which, while the event showed it to be adequate, the event also showed to be no more than adequate. Six hundred regulars took part in the assault; two hundred "loyalists" and Hessians held aloof in safe supporting distance. The fort was summoned to surrender, and warned that if it should be taken by storm, the laws of war would be enforced. And in the code which then was everywhere accepted, and which cannot be said to have been softened out of existence by another hundred years of civilization, no principle was better established than that a garrison rejecting capitulation, and carried by storm, could expect no quarter.

It seems to us to be unjust to the heroic memory of Ledyard and his men, who deliberately chose to refuse capitulation and to hold their ground "unto the death," to maintain that the threat of extermination was to them an unmeaning form of words. It cannot be that their expectation was to be permitted, behind the safe defence of their ramparts, to mow down the advancing columns of the enemy with grape and round shot and musketry—to receive the shattered fragments of their battalions upon the points of their pikes at the embrasures; and if at last enough survived to swarm over into the *terre-plein*, blind with rage and exhaustion, furious at the destruction which up to that moment they had been impotent to avenge, that then the combat was instantly to cease, and the unharmed garrison was to march out as quietly as they might have done before their unsuccessful defence. To maintain that they did not know the risk they were taking is to rob them of their strongest claim to honor and gratitude.

"We shall not give up the fort, be the consequences what they may." This was the answer sent back by Ledyard, supported by the unanimous vote of his officers, to the summons and the warning. Against the fort, therefore, the solid battalions were set in motion. Grape shot and musketry mowed them down with the terrible destruction that wastes an assaulting party, impotent for any purpose but that of merely moving forward: twenty men swept down by one discharge of an eighteen-pounder, double-shotted with grape; in the ditch, at the embrasures, at the *chevaux-de-frise*, at the sally-port—everywhere the most determined and bloody resistance, with every advantage of position, of cover, and of well-posted artillery; in the few minutes of assault, 170 killed and wounded, or fifteen more than the entire garrison, and among them both the first and the second in command. It was in this plight that the 400 survivors broke their way through the palisades and dashed through the gate and sprang into the embrasures, and confronted still almost the whole of the 155 who were pounding the lives out of them. What could be expected, we do not say of "murdering Britons," but of Christian New Englanders in like case, other than what followed? We know that the killing of the assailants did not cease before they entered: Major Montgomery was thrust through with a pike in an embrasure; a soldier was shot dead entering the gate; men in the ditch were crushed with cannon balls from the hands of the men above, who had not time to load their muskets; and that the heroic defence was still protracted, even after the enemy was in possession of the *terre-plein*, is conclusively established by the fact that Colonel Ledyard shouted to his men a command to surrender, after the entrance was effected, and that some of them after that kept up the fight in ignorance of the command. We know of no law of war, and no rule of morals, that requires the victorious force to cease hostilities before resistance is abandoned. We will even go further: no rule of morals seems to us to excuse a victorious force, having any right to fight at all, for relaxing its offensive operations until it is not only probable, but certain beyond a possibility of doubt, that resistance is either definitively abandoned or hopelessly crushed.

Beyond this duty of the assailant, notwithstanding the horror of the bloody day to Groton and New London, even these partial narratives do not show that the furious assailants were hurried by their rage. It is true that not more than thirty of the 131 casualties are thought to have occurred before the crest of the parapet was reached. But it is no less true, and it is irreconcilable with the accusation of an intended massacre, that twenty-six of the little garrison were absolutely unhurt; and that while an extraordinary proportion of the injured were killed, which shows that in the medley wounds were very deadly and very numerous—which shows, too, no doubt, that in the blind fury of the storm men really disabled by wounds may have received bayonet thrusts that ended them—yet there were forty-three wounded men who were not despatched. Rufus Avery, whose narrative is the most detailed and authentic of all, says it "was done in about one minute." "They did not bayonet many after they ceased firing their guns." "They very soon left off killing, and then went stripping and robbing the dead and wounded, and also those that were not wounded." And another account speaks of a British officer who ran about crying to them, "Stop! my soul can't bear it!"

Thus momentary—an inseparable part of the burst that carried the assailants over the parapet—was the slaughter of that heroic little band. Human nature being what it is, we doubt whether two regiments of Quakers, if they had been brought to the attack through that storm of bullets, could have been checked from the massacre sooner than this British infantry was. The story of the wagon full of wounded sent headlong down the hill in wanton cruelty has been long ago shown to have grown out of an accident occurring in a humane attempt at removing the disabled. The slaying of the chivalrous Ledyard with his own sword at the moment of surrender is now proved by an ingenious argument, from the nature of his wound, to be as improbable as it has always seemed atrocious. It detracts nothing from the undying fame of these simple men who stood and fell, most literally, *pro aris et focis*, that they dared the fate which befell them.

DAVIDS'S INDIAN BUDDHISM.

Lectures on the Origin and Growth of Religion, as illustrated by some points in the history of Indian Buddhism. By T. W. Rhys Davids. London: Williams & Norgate; New York: G. P. Putnam's Sons. 1881.

THESE lectures are written in a clear and pleasing style, and with Mr. Davids's usual power of illustration. The only fault we find with the book is that it is an attempt to do too much—to explain the principles of Indian Buddhism, and then by a sort of "differentiation" to illustrate the origin of religion or the growth of religion in other cases. It is evident that such a task

cannot be accomplished in six lectures of an hour each.

To take one or two striking points made by Mr. Davids. We observe he dwells on the absence of any soul-theory in Buddhism—in other words, that Buddha denied the existence of soul or "a personal self" (*icheit*). This is most true, but it would seem that the idea he attached to soul was "the soul (*attā*) that is the eye," "the soul that is the ear," down to "the soul that is the mind (*viññānain*)"—that is, either or all of the Khandhas or constituents of personal being in the present world. He denied that this soul survived the body. The question hinges on this, therefore: Do *we* accept the meaning of the word soul in this sense? In other words, should we be far wrong in stating that the Christian idea of soul is "purified character" in one aspect, or "degraded character" in the other? Of course the main point is "personal consciousness"; but this is not all. We can conceive of soul without any knowledge of previous existence; soul, that is, in the sense of character—the result of what we now are; and this is just what we find the Buddhists believe. The fact is, Buddha protested not so much against the survival of a principle of being—in fact, he acknowledged such a survival—but against the continuation of the identity of being. This is plain from the consideration that he taught his followers that in days gone by he was "so and so," and they were also "so and so." Now in these formulas—"I" was such and such a person, and "you" were such and such—there is the existence of "something" postulated, which in different connections "composed" another being without any conscious identity. That "something" is the Buddhist "soul."

Mr. Davids, on page 112, objects to the idea of "prayer offered to Buddha," and speaks of it as an impossibility. Here, again, the Christian idea of "prayer to a personal and living God" has interfered with the conception of other prayer than this—prayer in the sense of aspiration in worship. When the Buddhist adores the three precious symbols of his faith, he surely prays to them. It is true his prayer is not addressed to them as living and conscious beings; but, in the sense of *strong desire* expressed in their presence and in the act of worship, this amounts to prayer. In fact, we may safely ask, Can there be worship *without* prayer? The gorgeous ritual of the Buddhist temples proves plainly enough the weight attached to external service; and certainly if petitions offered up on bended knee and with prostrate form are any proof of prayer being possible among Buddhists, such proof is abundant.

The doctrine of Karma, or the power of "works," is a striking feature in the Buddhist religion. Mr. Davids alludes to this doctrine, and compares it with the doctrine of "Fate" in other religious systems. In one sense, doubtless, the parallel is a just one; as the poet says:

> ". . . Our deeds follow us from afar,
> And what we have been makes us what we are."

This is also confessed by the Buddhist: the usual formula adopted in the Sûtras is, "he departed [*i.e.*, died] according to his deeds"—he had made for himself a new home, built of the rafters and timbers hewn and shaped in his present life. This is the literal meaning of Karma. And in one sense this may be said of Fate, that we are made, by the inexorable decree of a power beyond ourselves, what we are. But in the Buddhist sense this power is in ourselves; it is subjective. No tyrant power constrains us beyond our own will, and so we stand self-condemned if by our own hands we have forged the chain that binds us.

Doubtless very much of the power Buddhism has exerted in the world may be traced to this doctrine of Karma. It is a covert acknowledgment of free will, and there is no appeal like this to hold the mind—appeal, we mean, to our freedom of choice. And this explains, too, the secret of Buddha's power as a preacher. If he had addressed his words and arguments to people in the power of an "outside fate," his words would have lost their virtue; but because he appealed to his hearers as able to choose the right and scorn the wrong—able to be true to themselves—he gained not only a ready hearing, but also a willing assent.

There is a striking parallel, too, between the order of Buddhist priests or mendicants, constituted by their leader as the living members of his church, and the constituted order of other religious bodies. There is no "priest" in Buddhism. In fact, though there be what represents an "altar" in the place of worship, as in the earliest sculptures, there never was a priestly service among the followers of Buddha. There is no mediation—to himself a man stands or falls; there is no sacrifice, except that of self, and *that* not to propitiate another, but to vindicate the right. There can therefore be no priestly office. But the "order," nevertheless, exists—an order of religious followers, bound by vows to a regular life, and under the strongest obligations to advance the cause of their church. It is a singular anomaly, yet it lies before our very eyes—a church without a supreme object of worship, and a body of men and women bound together by fast religious ties, but without any obligation, beyond their own sense of right, to obey the rules under which they have placed themselves.

Mr. Davids proceeds, toward the end of his book, to speak of the development of Buddhism. It was a most remarkable advance of the religious idea in the body of this fraternity when they invented a personal God, and attributed to Buddha the attribute of a living Saviour. But so it was. In the "Greater Vehicle," as it is called, we read of "the Eternal," and of a "Mediator," and of a paradise or heaven after death—none of which thoughts could have belonged to primitive Buddhism. It is most instructive to follow the inexorable working of the law which compels men to find out a god of some sort. If they will not have an "idol," they are driven to an "ideal." The ideal may be an abstraction, a negation, a cold, passionless nothing, but they call it and make it God. So the Buddhists invented their Adi-Buddha and their Avilokites'wara, the "first Buddha" and the manifester of his being in human form. Doubtless in this development we must look for influences exerted from without; the contact is to be found in the actual history of the world at the time of this expansion of belief—the Parthians had become Buddhists, and these, again, were placed in connection with Christians in Syria. This contact is historically true, and the effect of it is visible in the changed character of Northern Buddhism. No longer a system of pure negation, founded on a basis of morals, it sprang into spiritual life, confessing a God, actuated by hopes and fears of the future, and living in the presence of a manifested Being who heard and answered prayer.

Mr. Davids's great mistake, as it seems to us, is his endeavor to "isolate" Buddhism as a religious system, attributing it, in its rise and growth, to influences exerted only in the "Valley of the Ganges." We could as well believe that the civilization and literature of India were self-matured and independent, as that this religion was uninfluenced by outside forces. In fact, the impossibility of such an isolation is manifest at first sight if we follow the history of the Eastern world, and watch when and how the people of India have been visibly affected by foreign intercourse, and how both their language and arts have been welded on other and foreign stocks, and so have become what they are. It is impossible to suppose that their religion alone remained unaffected by such intercourse.

We commend this book of lectures to the careful study of all persons interested in the history of Buddhism, or in the comparative method of examining into "religious beliefs."

Cyclopædia of Practical Quotations, English and Latin, etc. By J. K. Hoyt and Anna L. Ward. New York: I. K. Funk & Co.

THE strange adjective in the title of this work is calculated to arrest the attention of others besides plagiarists and stock speculators. What is a "practical" quotation? One, say the compilers in their preface, which answers a literary need; which assists in composition. This definition is not very helpful, because any book of quotations—Mr. Bartlett's or Mr. Allibone's—or of proverbs or law phrases, would, by the same reasoning, be pronounced practical. A slight investigation shows that the utility of this cyclopædia is supposed to lie in its classification, and that it recommends itself to story writers seeking epigraphs for their chapters; to all who are called upon to write in young ladies' albums or birthday books (see *Flowers*, and the alphabetical assortment thereunder; *Months*, etc.); to the makers of sentimental bills of fare (see *Eating* and *Feasting*); and to a host of tradesmen anxious to garnish their circulars or advertisements with something neat and appropriate (see *Occupations*, and under it Jewelry, Mercantile, Perfumery, Tobacconists, Tonsorial, etc., etc.). The classification is not always commendable, as in *Ships*, when Navigation has already appeared under *Occupations*. Nor is the connection always apparent, as in the following, from "Hudibras," entered under *Influence:*

> "Witnesses, like watches, go
> Just as they're set, too fast or slow;
> And where in conscience they're strait-lac'd,
> 'Tis ten to one that side is cast."

Erasmus occurs under "Classical Latin Authors." There is a list of all the authors cited, with nativity and epoch, and a curious assemblage it is. "Ignoto," whose biographical denotation, like that of Junius, baffled research, is one of the most remarkable contributors. "Anonymous," on the other hand, has been altogether slighted. The prose extracts are subordinate to the poetical, and indicate a great catholicity of taste on the part of the compilers, and entire readiness to adopt at second hand, as in the case of "Bland," about whom no information is given beyond his surname, "Hokewell," "Melchior," etc. Indeed, the proportion and the choice of them almost justify the inference that the compilers took to prose late in life, as other people take to poetry. The indexing is full and even redundant, but capricious—*e.g.*, why is "old friends are best," which is entered under *friends*, not found under *best*, as well as "to stay at home is best"?

Fifty Years of Science. By Sir John Lubbock, Bart., M. P. London and New York: Macmillan & Co. 1882.

SIR JOHN LUBBOCK, in his address as President of the semi-centennial meeting of the British Association for the Advancement of Science, held at York last August, reviews the progress of science during the last fifty years. Originality or completeness could hardly be looked for in a survey of this nature, at once so general and so various—of necessity an *omnium gatherum* from all departments. In this instance it was rendered more fragmentary by the fact that the author was assisted by his scientific friends in such subjects as he did not feel himself competent to treat. Partly in consequence of this, the address is at once too superficial for the specialist and too

one-sided for the scientific public. Of course a review of the work of the British Association was very properly the main topic of interest on this occasion; but in his desire to do justice to his countrymen, Lubbock has forgotten that science is of no nation, and cannot be represented by English-speaking investigators alone. This exclusiveness is especially noticeable in his own department of biological research, in which he leaves wholly out of consideration prominent Continental naturalists. Neither is there allusion to the palæontologists and embryologists of France, Germany, and Switzerland during the last half century—men who laid the very foundations on which the younger workers are building to-day. Such a reference would have been all the more appropriate because some of their researches were undertaken in direct connection with the British Association, and were even published under its auspices. It would not have been amiss, also, had the work of other nations in the same field received some slight recognition in connection with the account of the deep-sea explorations undertaken by the *Porcupine* and *Challenger*.

In short, this paper is noticeable for what it omits as well as for what it contains, and cannot be considered by any but those to whom it was addressed as a full and impartial review of scientific progress in the last half century.

A Hunter's Wanderings in Africa. By Frederick Courteney Selous. With 19 full-page illustrations by J. Smit, E. Whymper, and Miss A. B. Selous. London: R. Bentley & Son.

Mr. Selous was a lad of nineteen when he began his career as a professional elephant hunter. This fact proved of no disadvantage to him, for when he applied to the King of the Matabele for permission to hunt in his country, "he asked me whether I had ever seen an elephant, and upon my saying No, answered: 'Oh! they will soon drive you out of the country, but you may go and see what you can do!' On my then saying that I had heard that he only allowed people to hunt in certain parts of the country, and asking where I might go, he replied: 'Oh! you may go wherever you like: you are only a boy.'" He soon proved himself to be a very daring and successful sportsman, with very remarkable powers of endurance. For the greater part of the time from 1871 to the close of 1880, he roamed about the country lying to the south and west of the Zambesi in search of elephants. It was a hard life and full of danger, but one of which it is easy to see the fascination. Our author had many thrilling adventures, but he lacks the literary power to use his materials to the best advantage. He is far too minute in his account of each day's sport, and his book would have been more readable had it been half the size. We confess also to an overpowering feeling of sadness as one elephant after another is killed, from the certainty with which their extermination is being effected. Mr. Selous himself appears to have shot over a hundred, while there were many others in the field with him, some of whom were still more successful. At first we find the hunters making a selection from the herds, taking only the bulls or the great tuskers. Later, after describing the killing of some not full grown, the author adds deprecatingly: "Elephants are, however, now so scarce that one cannot afford to leave even smallish ones alone." There seem to be good grounds for crediting the assertion of a recent writer in the *Spectator*, that Jumbo may live to be the only surviving specimen of his race. At least, from the accounts of the latest travellers, the time cannot be far distant when the elephant will be extinct in Africa.

Two of the chapters, upon the South African rhinoceroses and antelopes, were read as papers before the Zoölogical Society. The second is admirably illustrated by plates giving the heads of every species to be found within a certain well-defined limit. The author seems to have been a good observer, and scattered through his work are many notes on the natural history of the country over which he hunted that give it a certain value which, as a book of travels, could not be claimed for it.

A History of the Bank of North America, the first bank chartered in the United States. Prepared, at the request of the President and Directors, by Lawrence Lewis, jr. Philadelphia. 1882. 8vo, pp. 153 [not published].

The recent occurrence, on December 31, 1881, of the centennial anniversary of the incorporation of the Bank of North America, was fittingly celebrated by this historical sketch of the origin and career of that venerable, but still active and successful, institution. It was organized at a very critical period of the Revolution, almost wholly from a patriotic desire to sustain the feeble credit of Congress. By its aid troops were levied, arms and ammunition obtained, supplies furnished to the patriot army, and the expenses of the various departments of the struggling government defrayed. It owed its existence mainly to the inspiration of Robert Morris, the acknowledged financial leader of the Revolution, and it received the hearty and substantial support of the principal merchants of Philadelphia, and of a number of Dutch capitalists, who had faith in the success of the new republic. Mr. Lewis naturally gives at length the story of the early struggles of the bank for recognition, and in less detail the account of its later and less eventful history. It has outlived the national banks which Hamilton so urgently recommended, and it is itself now modestly registered among the national banks of the country. It has withstood the shocks of hostile legislation and of financial disturbances, and is to-day one of the strongest as it is one of the most conservative banks of even that conservative city, Philadelphia. The portraits of Robert Morris and of its successive presidents, from Thomas Willing down to the present incumbent, seven in all, are valuable in themselves, and curious as illustrations of the change of type and physiognomy in the course of a hundred years. A popular edition ought to be published.

Kultur- und Litteraturgeschichte der französischen Schweiz und Savoyens. Von Dr. Herman Semmig. Zürich. 1882.

In reviewing a popular history of Switzerland, not long ago, we had occasion to lament the want of an English history of that country which should give the results of late investigations, as well as describe recent events. But Dr. Semmig's book, for those who read French and German, is better than a purely English work would be. In the space afforded by a small octavo, printed in Latin type, the author has given a very readable account of the history and literature of the region described, each chapter and section being "illustrated" by long quotations, untranslated, by local writers. In deference to the popular preference for erroneous historical nomenclature, he does not venture to call his work a history of Romance Switzerland, which, he maintains, is its proper designation; but he protests on every occasion against the encroachments of Parisian vanity in a way that would please even Mr. Freeman. "How many," he asks, "have reflected how the French language was introduced into a land that has ever been politically independent of France? . . . France —that France of which Paris is the centre—has enjoyed the glory of being the only hearth and home of the French language and literature," to dispel which error is a main object of his book. With Mr. Semmig's historical standpoint we have no fault to find, but his anger at the incorporation in the French literary nationality of Rousseau, De Maistre, François de Sales, Constant, and Mme. de Staël is rather overdone. We suppose an author may be allowed to change his allegiance, even when the country of his choice is France, and that over such naturalized citizens the historian of literature has as good a claim as the tax-gatherer.

Though it receives little attention from foreigners, the history of the region enclosing the lakes of Geneva and Neuchâtel equals in interest, both in mediæval and modern times, that of any other part of Europe; and the difficulty in the way of becoming acquainted with it has, in a large degree, been removed by Mr. Semmig's admirably-prepared volume.

BOOKS OF THE WEEK.

Adam, Madame E. A Fascinating Woman. Philadelphia: T. B. Peterson & Bros. 75 cents.
Alcott, A. B. Sonnets and Canzonets. Boston: Roberts Bros. $1.
Armstrong, G. F. A Garland from Greece. London: Longmans, Green & Co.
Arnold, M. Irish Essays, and Others. Macmillan & Co. $1 75.
Bacon, H. A Parisian Year. Illustrated by the Author. Boston: Roberts Bros. $1 50.
Betham-Edwards, M. Exchange No Robbery. Harper's Franklin Square Library. 15 cents.
Classic Tales: Comprising Rasselas, the Vicar of Wakefield, Gulliver's Travels, and the Sentimental Journey. London: George Bell & Sons.
Craik, Mrs. D. M. Plain Speaking. Harper's Franklin Square Library. 15 cents.
Crowell, E. P. Selections from Latin Poets. Boston: Ginn, Heath & Co.
Cunningham, W. Growth of English Industry and Commerce. Cambridge (Eng.): University Press. $3.
Dos Passos, J. R. Treatise on the Law of Stockbrokers and Stock Exchanges. Harper & Bros.
Fairley, W. The Ventilation of Coal-Mines. D. Van Nostrand.
Froude, J. A. Thomas Carlyle. Chas. Scribner's Sons.
Fulton, J. A. Peach Culture. Revised and enlarged edition. Orange Judd Co. $1 50.
Hartford *Evening Post* Annual for 1882: Biographical Sketches of Representatives of Connecticut in Congress, Members of the State Legislature, etc. Hartford: *Evening Post* Association.
History of the Second Massachusetts Regiment of Infantry: Gettysburg, by Col. Chas. F. Morse; Chancellorsville, by Capt. Geo. A. Thayer; A Prisoner's Diary, by Capt. S. M. Quincy. Boston: Geo. H. Ellis. 25 cents each.
Hodgson, W. B. Errors in the Use of English. 3d ed. Edinburgh: David Douglas.
Holland, J. G. Arthur Bonnicastle.—The Bay Path. Charles Scribner's Sons.
Irving's Life of Washington. Vol. v. G. P. Putnam's Sons. $2 50.

Fine Arts.

THE TWO OIL-COLOR EXHIBITIONS.

The Annual Exhibitions of the National Academy of Design and of the Society of American Artists are again open to the public. The catalogue of the Academy contains 839 numbers, and that of the Society of American Artists 128. Both are overcrowded, and almost equally so, but there are fewer works of entirely valueless character in the latter collection than in the first. The effect of this overcrowding is, of course, as bewildering as usual, and, although it seems useless to complain of it, yet since it detracts so seriously from the effectiveness of an exhibition, and from the comfort of a visitor, we are impelled to record another protest against it. The task of the committees whose function it is to decide what works shall be received and what rejected is certainly a delicate one, but is also a very important one both to exhibitors and to the public. And, although it is a delicate task, and one which can be rightly discharged by the most competent judges only, it is not one which presents any great difficulties. It does, however, require considerable courage; for the canvases which do not merit public notice, and which ought not, therefore, to find place on the walls of these exhibitions, are by no means exclusively those of young and unknown persons, but are frequently those of older and well-known artists.

There is no more important or grave duty devolving upon the managers of these institutions than that of appointing men of assured capacity to examine and pass upon works offered for admission, who will discharge their function with integrity and firmness—rejecting, when occasion calls for it, the works of their own members as promptly as they reject those of any other persons.

Overcrowding is so seriously objectionable, even where all the pictures are good, that it ought to be avoided at almost any cost. For only a certain very limited number of pictures can be placed where they can be favorably seen in any case, and, therefore, by overcrowding, nothing is really gained. It is no advantage to an artist to have his pictures placed where they cannot be favorably seen, and it may even be an injury to him, while it detracts greatly from the proper effectiveness of those which are well placed. One line of large pictures, and two of small ones, is as much as can ever be seen to advantage; and these ought not to be placed too closely together, but at least six inches of space ought, if possible, to be left unoccupied between them. It is perfectly possible to carry out such a plan as this, as the managers of the Grosvenor Gallery in London have abundantly shown. If more really excellent works are produced in a year than our present galleries would thus accommodate—which we very much doubt—then the exhibitions might be held more frequently, or more galleries might be prepared. And even though all the good pictures of a year might not be shown by such a plan, it would still be better so; for perhaps the greatest evil of overcrowding is that by it the eye and mind are so fatigued and surfeited that a feeling akin to disgust is apt to be conceived, and the proper sense of the preciousness of good painting is thus lost. This is an inevitable effect of overcrowding, even where all the works are meritorious. It is still more the case where so many of them are either feeble or meretricious in character.

The great and increasing numbers of young persons who now take to painting show a deplorable tendency to exhibit their work prematurely. The Academy exhibitions are largely made up of such works. The case would not be so bad if this immature work were simply crude and unskilful, as it is when it so largely affects a supposed artistic manner. The efforts of beginners whose purpose is earnest, and who work from nature with modest thoroughness, are often interesting and instructive. Ten or fifteen years ago such efforts were not unfrequently shown in the Academy exhibitions, and they gave promise of something like a living school when, to the faithfulness of affectionate study of nature, an adequate knowledge of the requirements of exemplary art should be added. But very few of those who gave this promise have gone on in those lines of study and practice which might have led to its fulfilment. The current of interest in the not wholly exemplary aims and methods of the modern schools of the Continent of Europe have proved too strong for them; and year by year the tendency to follow these aims and methods without discrimination has shown itself stronger, until it has become the ruling tendency. It is plainly apparent, on the first general survey of all our exhibitions at present, that the influence of the present French and German schools, which has been thus growing of late, is now the leading influence in this country. It not only shows itself in the works of the younger men who have sought their early training in those schoools, but it is apparent also in the works of nearly, if not quite, all of our older artists.

This influence, in itself, is partly good and partly not good. It is good in so far as it leads to a more large and just method of regarding nature in total effect, of securing a consistency and harmony of tone by the proper relations of color masses one to another, and of subordinating details to masses. It is not good in so far as it tends to incompleteness of aim and method—by which we mean the sacrifice or omission of some essential qualities of painting while exaggerated prominence is given to other qualities—and thus to substitute mere sketching for quietly-finished painting, or to arrest the cultivation of good taste in choice and treatment of subject. In short, the influence of this foreign art is good in so far as we discriminate between its qualities and its faults—assimilating the one and rejecting the other. French art—for it is French art which really dominates in all the continental schools—deals as a rule with but a few of the more obvious external qualities of nature. These it quickly, and often masterfully, seizes, but other and more essential qualities it largely omits. It is therefore not a wholly exemplary school for a student of painting. In entirely good painting there is no omission of anything that contributes to completeness of visual truth. In such painting a perfect balance is maintained between the elements of form, color, and chiaroscuro, and all that pertains to these primary constituents of visual impressions. French painting, notwithstanding its good qualities, is unbalanced and partial. Its chief aim lies in the direction of chiaroscuro and resulting tone, but too exclusive pursuit of chiaroscuro leads to exaggeration, unquietness, and untruth of effect, which are all characteristic faults of French art. Exaggerated chiaroscuro, also, is destructive of pure and full color—giving such depth to shadows as to render true color impossible in them. The exhibitions which we are considering offer numerous instances of this loss of color in shadow, consequent upon exaggerated depth of shade. It is true that as regards chiaroscuro our American art has, hitherto, been especially feeble, and the lesson of the French school is, therefore, a valuable one for us, in so far as it enforces its importance. But it is hard to learn anything rightly under faulty instruction.

There is not the slightest need for the waste of time and misdirection of taste which result from following the partial and tentative methods of the modern schools, or for the independent and blind groping after methods of which the work now done by us shows so many unhappy signs. Essentially sound and perfect methods were long ago attained in Venice, and may always be securely acquired there. But if we will not learn in Venice, let us, by all means, learn what we may in France. A broad and manly style is a good thing. If the French can help us to attain it, let us accept the help. But in so far as French painting is loose and sloppy we had better not follow it. These bad qualities form no proper part of a broad and manly style. Rapid and dashy sketching as a mode of study—even that which may be almost unintelligible in form—has a very proper and important *raison d'être* when rightly and unaffectedly directed toward particular ends, as in notes and studies for color and chiaroscuro. But such work is right as a mode of study only. It is not right as a final mode of painting. Sketches and studies of this kind belong properly in the studio rather than in the place of public exhibition. As a rule, all painting, as such, ought to be finished. But of course the standard of finish varies according to the size of the canvas and the consequent distance from which it should be viewed, and it may not be always possible to fix this standard with absolute precision. In general, however, a right degree of finish is that which renders the visual impression of a subject complete when the picture is viewed from its proper distance. This distance, as is well known, is that which brings the whole field of it comfortably within view. It is usually considered about equal to the greatest dimension of the picture. At this distance everything in a picture should appear finished. The finer execution of a small picture would not have effect upon the eye at the distance from which a large picture would have to be viewed, and such execution would therefore be useless and wrong on a large canvas. The coarser execution of a large picture would be unintelligible at the distance proper for a small picture, and would therefore be useless and wrong on a small canvas. This principle, like most others, is subject to more or less modification, according to various circumstances of artistic purpose; but it is as much a principle, and as important a one, as any other. Now, there is a strong tendency among our rising artists of the new school to disregard and to violate this principle. These artists execute pictures whose greatest dimensions may not exceed two feet, with a degree of coarseness that would be right only for canvases of twenty-five or thirty feet. This is the case with such men as Mr. Wm. M. Chase, Mr. J. Alden Weir, Mr. Quartley, Mr. Bunce, and others. And, more than this, the execution of these men is largely inaccurate and meaningless as well as coarse. A very coarse touch may yet be a very subtle and true one. The degree of coarseness in a good touch only indicates the distance from which it should be viewed. It is otherwise not different from a finer one. The great touches in the foreground of Tintoret's "Crucifixion" in Venice differ in character from the finer touches in a small picture by any true Venetian master only in being calculated for effect upon the eye when situated far enough off to take in the whole design. They are wonderfully accurate touches—giving, with a few broad sweeps of the brush, perfectly clear and intelligible characterization to each object represented. But the great touches in many of the works of these artists of ours do not become intelligible at any distance as anything more than shapeless spots of light or dark color.

Another conspicuous fault which mars the good qualities in this art of ours is the very bad taste which it frequently displays in choice and in treatment of subject. The beauty and grace of nature, whether in landscape or figure subject, seem not to appeal to our artists; but there is nothing that goes to the making of an artist which is more important than good taste. Indeed, it may be safe to say that his first qualification is a ready sense of what makes an object or a natural scene a fit subject for art. A man may have every other qualification: he may possess all the powers which the best technical training can secure; he may have a quick feeling for all mere facts of form and color, and may be able to give the most facile and truthful expression to it—yet if he have not cultivated taste, he cannot be an artist in the truest sense of the word. This want of taste in our art is due largely perhaps to the reaction of the last quarter of a century from the academic conventionalisms, under which taste had become wholly artificial; and also, perhaps, to the influence of our cruelly commonplace surroundings in America. The general movement toward naturalism of the past twenty-five years has, both in Europe and America, induced the mistaken idea that nature alone affords all the inspiration and guidance that art requires. It was well, indeed, that the academic idea of beauty should give place to the idea of nature; for the academic idea was hollow and meaningless, while by the idea of nature much strong and true life has been infused

into all departments of art. But art requires a great deal more than the idea of nature. It requires, among other things, that disciplined sense of beauty which we properly mean by good taste.

Another essential quality which our art does not yet exemplify, in any high degree, is that of design. The faculty of so adjusting the parts of a subject as to secure a beautiful and living relationship between them, and thus to make an organic unity of the whole, is, perhaps more than anything else, the peculiar faculty of an artist. Some of the more obvious elements of design exist, indeed, in most of the works under consideration. But few if any of them exhibit those more subtle relations of magnitudes in the general proportions of masses, those sequences of ordered parts, and those sympathies of line with line which make the works of Turner, of Titian, or of any other true designer so beautiful.

We propose, in another article, to comment in detail upon some of the canvases in these exhibitions.

HENRY HOLT & Co.

JUST PUBLISH:

The Old Regime.

COURTS, SALONS, AND THEATRES.

By LADY JACKSON.

12mo (uniform with 'Old Paris'), $2 25.

NEW LEISURE-HOUR BOOKS.

$1 EACH.

HEAPS OF MONEY. By W. E. Norris, author of 'Matrimony.'

AUERBACH'S SPINOZA.

Published this Day.

ALEXANDER HAMILTON. By Henry Cabot Lodge. 16mo, cloth, gilt top, $1 25.

This is the second volume in the series of LIVES OF AMERICAN STATESMEN, so happily begun by Mr. Morse's 'John Quincy Adams.' Mr. Lodge's familiarity with American political history is well known, and this book will be looked for with unusual interest.

HISTORY OF THE EGYPTIAN Religion. By Dr. C. P. Tiele, of Leiden. Translated from the Dutch, with the assistance of the author, by James Ballingall. Vol. XXVII. in the English and Foreign Philosophical Library. 8vo, cloth, gilt top, $3.

This is the first volume of a series on the Comparative History of the Egyptian and Mesopotamian Religions, from the well-known author of 'Outlines of the History of Religion.' Egypt, Babel-Assur, Yemen, Harran, Phœnicia, and Israel will be treated of in the course of the work.

THE FISHER MAIDEN. By Björnstjerne Björnson. 16mo, cloth, $1.

The fourth volume of the authorized edition of the novels of this Norwegian author. The story is written with the power and simple charm to be found in all of Björnson's stories.

AMERICAN CLASSICS FOR Schools. HAWTHORNE. In 1 vol. 16mo, illustrated, 60 cents.

This is the second volume of a series intended to supply, in attractive form, passages suitable for school-reading, which will give the pupil a taste for what is best in American literature. The extracts have been made with great care and judgment. The volume contains a portrait of Hawthorne and eight illustrations.

NOW READY.

LIEUT.-COMMANDER GORRINGE'S WORK ON

Egyptian Obelisks.

Folio, printed from type, 176 pages of text, 52 full-page illustrations (inserted), of which 32 are artotypes.

This work, comprising eight chapters, gives the history of every Egyptian obelisk now known to exist, the methods employed in quarrying, transporting, and erecting them, and a complete description of the manner of their removal from Egypt in ancient and modern times.

CHAPTER I. Removal of the Alexandrian Obelisk, "Cleopatra's Needle," to New York.
" II. Archæology of the New York Obelisk.
" III. Removal of the Luxor Obelisk to Paris.
" IV. Removal of the Fallen Obelisk of Alexandria to London.
CHAPTER V. Re-erection of the Vatican Obelisk.
" VI. Records of all Egyptian Obelisks.
" VII. Notes on the Ancient Methods of Quarrying, Transporting, and Erecting Obelisks and other Massive Monoliths.
" VIII. Analysis of the Materials and Metals found with the Obelisk at Alexandria.

Edition positively limited to 1,500 copies. Price $15 per copy, bound in cloth, delivery free.

Address HENRY H. GORRINGE, 32 Waverley Place, New York.

Mr. Alcott's Sonnets.

SONNETS AND CANZONETS.

By A. Bronson Alcott. 16mo, price $1.

They are interesting as the work of a man over eighty years of age, and as the expressions of a life in which no hardness or bitterness or doubt has ever been allowed to take root. They are full of enjoyment of life, of the beauty of the world, of the goodness and the worth of human beings. . . . Mr. F. B. Sanborn has written, as an introduction to this volume of poems, a complimentary letter to the author and an essay, rich in illustrations, on the canzonet.—*Boston Daily Advertiser.*

Mr. Bacon's Paris.

A PARISIAN YEAR. By Henry Bacon. Illustrated by the author. 16mo, price $1 50.

The author, a Boston artist, has resided in Paris many years. "It would," says the Boston *Advertiser*, "be hard to find another book so light in touch, so wide in range, and that gives so vivid a picture of the good side of artists, actors, peasants—indeed, of all the world. Life everywhere seems a pleasant thing: in Paris, in the country, on the coast of Brittany, or the farms of Normandy."

ONESIMUS: Memoirs of a Disciple of St. Paul. By the author of 'Philochristus.' One volume. Uniform with 'Ecce Homo' and 'Philochristus.' Price $1 50.

Another of those admirable books descriptive of the life and times of Christ and his Apostles, and told in a style felicitously adapted to the subject, as those who remember "Philochristus" will readily believe.

Sold by all booksellers. Mailed, post-paid, by the publishers,

ROBERTS BROTHERS, Boston.

A Series of

TEN GEOLOGICAL PLATES,

27½ x 36 inches, containing Fifteen Diagrams designed for use in Schools and Colleges. Edited by A. S. Packard, Jr., Professor of Geology and Zoölogy, Brown University, and Editor of 'The American Naturalist,' author of 'Zoölogy,' etc.

The diagrams are to be accompanied by a Text-Book, FIRST LESSONS IN GEOLOGY, 128 pages, 8vo, by Prof. Packard.

The series of diagrams are arranged in the form of landscapes, and contain a number of original restorations of American, Silurian, and Devonian animals, especially Carboniferous, Jurassic, and Tertiary Vertebrate animals, by Prof. E. D. Cope, H. F. Osborn, and the Editor; with restorations in the text.

Price for the ten diagrams and book, postage paid, $6. Address all orders to THE PROVIDENCE LITHOGRAPH CO., Providence, R. I.

A Magnificent Library

Of over 10,000 vols., the result of collections of the finest works, made between 1790 and 1850, is to be disposed of by private sale. There are many curious and rare books, some having been printed at the beginning of the seventeenth century. For catalogues, price 25 cents, etc., apply to

"QUICK AS A WINK."—Rockwood's In- stantaneous Photographs, 17 Union Square, N. Y

The Nation.

NEW YORK, THURSDAY, APRIL 27, 1882.

The Week.

MR. CHARLES DARWIN, who has just passed away full of years and honor, is probably the man who has done most to make the nineteenth century famous, full as it has been of wonders, because he has done more than any other man since Copernicus to change the ideas of the civilized world touching man's relations to the physical universe. Copernicus and Kepler may be said to have closed the mediæval epoch, and fatally shaken the authority of the Church in the domain of natural philosophy, but then they never reached the popular mind, and produced but little rearrangement of ideas outside the scientific world. Moreover, the doctrine of evolution as an explanation of the earth and the heavenly bodies as we now see them, had made its appearance long before Darwin's day, without producing much impression on morals, or theology, or politics. It was Darwin's application of it to the explanation of the animal world, as we now see it, which made it a really great force in human affairs —a force which, though it may be said to have been felt for but little more than twenty-five years, has already profoundly affected the modern way of looking at nearly all social problems. It is safe to say that there is hardly any sphere of human activity in which the influence of his ideas is not felt in a greater or less degree, and it bids fair to grow with an accelerated ratio. The hostility with which they were at first received by the Church has already greatly abated, and probably the best educated and most influential portion of the clergy of all denominations now allow them to govern their expositions of man's relation to the unseen as well as the seen universe, and are at least content with his explanation of the process through which the race became self-conscious and moral.

It is impossible to enumerate here all the ways in which his influence has stimulated or controlled sociological investigation and legislation. Its more obvious effects are to be seen in the great impetus given within the last quarter of a century to inquiry into the mental and physical condition of the savages, and in the greatly increased popular interest in comparative anatomy and comparative politics. Such books as the late Mr. Bagehot's account of "nation making," in which the Darwinian process of "natural selection" is applied to the origin and growth of political societies, are undoubtedly due to Mr. Darwin's suggestion. To the same agency we must ascribe the great stimulus given of late in legislation to the improvement of surroundings as a means of improving human character. No more serious blow was ever given to the ancient plan of reforming mankind by simple rewards and punishments, than Darwin gave when he first pointed out the enormous influence, moral as well as physical, of the "environment" on the animal. We now every day see more and more attention given to bettering the conditions of men's lives as the real means of bettering their lives, and less and less confidence reposed in simple commands addressed to conduct. In fact, there are some signs that this influence is proving too strong, and carrying both law-givers and philanthropists into the dangerous extreme of underrating the power of the human will working against environment. It must be admitted, too, that the application of the theory of natural selection, or, as Herbert Spencer calls it, the "survival of the fittest," to social and political arrangements, useful as it is in giving effort a rational and fruitful direction, has some tendency to repress sympathy for weakness and incapacity. Darwinism, in other words, has done something for Bismarckism. It gives might a new title to the possession of the earth, and makes "the wall" seem more than ever the proper destination of the incapable, the inconsequent, the feeble, and the sickly. That the race will be the better eventually for this immense revelation (for such it certainly is) of the way in which, as far as man on earth is concerned,

"— through the ages one unceasing purpose runs,"

there can be no doubt. But the period of transition from the older view, which provided so large and even honored a place in nature for helplessness, and ignorance, and weakness, is likely to have many dark places in it, in which the most orthodox evolutionists will be puzzled and tried.

It is a significant circumstance that the subcommittee of the Committee on Banking and Currency in the House have agreed upon a report—a very able one, by the way—concurring in the recommendations of the Secretary of the Treasury and the Director of the Mint regarding silver coinage and silver certificates —that is, recommending the discontinuance of both. There is no evidence, however, that this committee was "packed" against silver. The Speaker was himself a silver man, representing a State which gave nearly all its votes for the Silver Bill. So, also, was the Director of the Mint, who held a seat in Congress at the time. So far as "packing" might go it would be more reasonable to look for packing on the other side. The obvious explanation of the report is that Congress and the country have been coming around to a rational view of the matter, aided, perhaps, by the refusal of European countries to join us in international remonetization. The failure of the Paris Conference to reassemble at the appointed time, after two previous failures to do anything or even to attempt anything, has had a marked effect upon the public mind in America. The excuse put forth by the bimetallists, that the Conference has been postponed to "give time for public sentiment in England to ripen," is not calculated to heighten confidence in this country in the efficacy of our Silver Bill, seeing that every month's coinage takes out of the market the very material calculated to hasten the ripening process in England, and thus postpones the desired harvest.

A bill having passed the Senate to repeal all "permanent appropriations" except (1) those in which the Government acts merely as a collecting agent to receive or disburse moneys not belonging to itself (Marine Hospital dues, Indian trust funds, etc.), and (2) those which by common consent are necessary and indispensable, such as the salaries of judges and interest on the public debt, it has been discovered that one of the permanent appropriations so repealed is that which provides for the purchase of $24,000,000 worth of silver bullion each year for coinage into silver dollars, so that hereafter, if the bill becomes a law, it will be necessary for Congress to make an appropriation every year for that purpose. This the silver-men regard as a great outrage and swindle. It is not enough for their purpose that they have a law providing for the coinage of $2,000,000 of silver per month, which law requires the Appropriation Committee of Congress to report the measure necessary to carry it into effect every session. They demand to be placed in a better position in this regard than the Army, the Navy, the pensioners, or Congress itself, all of whose expenses have to be paid by annual appropriations. The outcry they are making indicates that they have little confidence in the strength of their position.

The question who shall take charge of the lower Mississippi is now before the Senate in the Mississippi Improvement Bill, which proposed to appropriate $15,000,000 to the repair and building of the levees, but has been amended into a single appropriation of $6,000,000 for the improvement of navigation. The most noteworthy thing in the debate thus far is the general abandonment by the Democrats, in this matter, of their old sensitiveness about State rights. Senator Morgan, of Alabama, makes a vigorous stand against the appropriation, but then the cynical ascribe this to the fact that Alabama has no levees and does not lie near the Mississippi; and the same might be said of Senator Bayard. The more obvious points in favor of the appropriation are that the work of keeping the Mississippi within its channel is far too great for the individual property-holders along the banks, even if they were able to combine their efforts and work on a common plan; that the States, for somewhat similar reasons, cannot meet the difficulty either; that the General Government alone has the legal power and the money to do all that needs to be done; that it is hardly possible that the constitutional duty of keeping rivers navigable, derived from the power to regulate inter-State commerce, does not include the duty of keeping the waters of a great river within its banks, so that it shall not overflow vast tracts of country, and, besides destroying enormous amounts of property, make its channel unapproachable for hundreds of miles by any species of vehicle. The Mississippi, in the condition in which it has been for the last two or three months, does not subserve the purposes of inter-State commerce. On the contrary, it cuts off the inhabitants of three or four States from the use of it for commercial purposes

altogether, besides producing, in one of the richest regions in the Union, the effects of the ravages of an invading army. Whether, if the Government takes charge of the banks of the lower Mississippi, it will not have to take charge of the banks of all the navigable rivers in the country, is a question which it is of course proper to ask, but the answer to it must be based not on possibilities but on probabilities.

During the week the New York banks gained $4,093,400 in their surplus reserve, which now is a little in excess of $9,000,000. No gold was exported during the week, the excess of merchandise imports above exports having been paid for with securities. At the close of the week foreign exchange was nearer to the gold-exporting point than at the opening, but the prevailing opinion was that securities would still be shipped instead of gold. At the Stock Exchange, United States 4 per cent. bonds advanced to 121⅞, and the 4½s to 116½, these being the highest prices ever paid for them; on the last day of the week a fractional part of this rise was lost. The general depression in the stock market continued until Saturday, when the "bears" began "covering their short sales," with the result of advancing prices at the close of the week above those at the opening of the week. For some time only speculative considerations, and these chiefly personal, have had any influence in the stock market, so thorough has been the demoralization there. The condition of the general trade of the country is rather quiet, but the Clearing-house returns indicate that the volume of business is still very large. The outlook for the grain crops was never better at this season of the year, and the high price of wheat for months warrants the expectation of an immense acreage this year. The stoppage of some mills, and the dulness in several manufacturing branches, have had some influence of an unfavorable character on the coal trade. In all the foreign money markets the rates for money are low. Silver bullion continues steady in price.

A petition has been presented to the House from Milwaukee asking for the prohibition of the Irish immigration by a bill framed on the same lines as the Chinese Bill. The objections to the Irish immigration seem to be very similar in character to those urged against that of the Chinese, with this additional one, that the Irish owe allegiance to a foreign Pope. In fact, there appears to be no race of immigrants in the country which does not think that it would be far better if all the other foreigners were kept out of it, and some even go so far as to think that America would be much improved by the exclusion of the natives. If ever the passion for exclusion gets so strong that the wishes of each race will have to be gratified, the country will be left uninhabited, because all will have to "go." There is no race here whose presence the other races admit to be wholly useful or improving, or in no sense an unavoidable calamity. The "ignorant foreigner" is somewhat serviceable to the native, as furnishing somebody to blame for all the crime and corruption, but the other foreigners get no good out of him, and think he lowers wages, and does not live nicely enough. But in practice all seem to get on amazingly well together, make plenty of money, and contrive to be happy and comfortable.

As was expected, the contest about the seat for Utah in the House of Representatives has been decided against Mr. Cannon, the Mormon apostle. As our readers will remember, at the last Congressional election Mr. Cannon received a large majority of the votes cast in the Territory of Utah, but Governor Murray gave the certificate of election to Mr. Campbell, the candidate of the Gentiles, although the number of votes cast for the latter was comparatively insignificant. Governor Murray took the ground that Mr. Cannon was not and had never been a citizen of the United States, and was therefore ineligible. Mr. Cannon then contested Mr. Campbell's right to the seat. The House of Representatives has by its vote on the 19th inst. unseated Mr. Campbell on account of his having received only a minority of the votes cast, and declared Mr. Cannon not entitled to the seat on the ground that he is a polygamist. Mr. Cannon made a long speech in his own behalf, availing himself of this opportunity to go into an elaborate defence of the system of polygamy, but without adding anything to the stock of argument usually drawn upon by Mormon missionaries. The effect of the rule thus established by the House of Representatives, that no polygamist shall be admitted as a delegate from a Territory, will not be the election of anti-Mormons in Utah, but the election of Mormons who are not polygamists, for there are a good many of that kind. Mr. Hooper, Mr. Cannon's predecessor as a delegate from Utah, belonged to this class. While Cannon's defence of polygamy on the floor of the House of Representatives can only serve to intensify the popular feeling against that "peculiar institution" and the Mormons generally, his exclusion from the House will, on the other hand, probably be used by the Mormon leaders to inflame the fanaticism of their people. It is not likely to contribute much to the practical solution of the troublesome problem. The working of the Edmunds law, of course, has not yet become apparent, and there is, therefore, no experience yet to enable us to judge how much can be accomplished on that line.

Mr. Cannon would, it appears, have been accused of murder also had his polygamous opinions not laid him low. A Jew, who at one time was a Mormon under the name of Abraham Levy, but is now a plain citizen, without any church, under the name of Adolph Razin, makes oath that in the year 1855 Cannon, after carefully explaining to him the Mormon doctrine of "blood atonement," which makes death the penalty of heresy or heterodoxy, proposed that he (Levy or Razin) should slay one Babbitt, then Secretary of Utah Territory, in order to "redeem and save his (Babbitt's) soul from sin." Razin did accompany Babbitt to Washington, but did not kill him on the way, as had been planned, so that his soul was not redeemed and saved till he was on his way back, when he was duly murdered by some other person. It appears that this affidavit was prepared with the view simply of ousting Cannon from his seat, but if there is any truth in it, it ought to be used to get him indicted. The "blood-atonement" doctrine works both ways, and has also a strong hold on the Gentile mind, and if Cannon caused the death of Babbitt, his soul also ought to be "redeemed and saved from sin."

There is scarcely any doubt of a general willingness to see the medical attendants of President Garfield, as well as all those who ministered to his comfort during those long months of suffering, liberally compensated. An invidious discussion of the scientific merits of the medical treatment the patient received, as a basis of the valuation of the professional services rendered, seems peculiarly out of place. It may well be assumed that everybody did his best, and that, whatever errors may have been committed, there has never been the least reason to doubt the untiring watchfulness and conscientious devotion surrounding President Garfield's bed. Nobody will, therefore, grudge to those concerned the pecuniary compensation awarded to them in the bill reported to the House of Representatives. Only one feature of that bill seems to us open to serious question. It is the provision that Surgeon-General Barnes and Dr. Woodward be promoted in their Army rank and receive pay accordingly as a reward for the services rendered on this occasion. This seems to us very objectionable. Promotion in the Army should be regulated upon fixed principles. The mere fact that Army surgeons were employed in a case of importance would certainly not give them any claim to higher rank. Even in monarchical countries they would in such a case be considered entitled only to a decoration in the shape of a ribbon or a cross, but scarcely to a promotion over the heads of others. This would be justified only by conspicuously distinguished service, which in the case of Drs. Barnes and Woodward is scarcely asserted.

Now that District Attorney Woodford is about to make another effort to bring Mr. N. M. Curtis to trial for levying assessments on officeholders, we trust Mr. Curtis himself will waive technicalities and meet the case like a man. This is the more desirable because we understand his principal defence is that he behaved gallantly at Fort Fisher, and it does not become a brave soldier to try to escape answering in a court of justice by such pleas as that his name is not "Nehemiah," but Newton. Moreover, there is an English decision which tells dead against the Fort Fisher plea—viz., that meritorious behavior at Waterloo was no defence to a charge of furious driving in the streets. There is, indeed, no system of jurisprudence which allows military services to be pleaded in bar of a prosecution for civil crimes or misdemeanors. Such services may properly be considered by the pardoning power after conviction, but the District Attorney and the court and jury can take no notice of them. Moreover, the better soldier a man has been the more careful should he be not to seem even to wish to evade an accusation of any kind.

or to get an advantage by such a thing as a "misnomer." Dodging of all kinds goes ill with the military character. Mr. Curtis, far from trying to avoid a trial, ought to be urging the Civil-Service Reform Association and the District Attorney to bring him promptly to the bar, and to indict him by any name they please, as long as he is the man they mean. Brave soldiers ask eagerly where are their accusers, not for the purpose of escaping from them around the corner, but for the purpose of confronting them.

There has been a good deal of controversy in the West as to Mr. Jesse James's spiritual condition, and we have ourselves received one or two angry remonstrances for alleging his standing in the Baptist Church before his death to have been good. There is, of course, more or less obscurity about everything connected with him, and we should be sorry to vouch absolutely for the truth of anything that is said about him, except that he was a robber and murderer of the worst kind; but that we were not wrong about the regularity of his position in the Church, for which one correspondent has challenged us to produce "a particle of proof," we think the following letter, which has recently appeared, is sufficient evidence:

"*To the Kansas City Times.*

"AUSTIN, Texas, April 12.—In your sketch of the religious views of Jesse James you are mistaken as to the time of his baptism. In October, 1877, at a meeting I held in the Baptist Church in Kearney, he professed conversion, and I baptized him. He prayed several times publicly in the prayer meetings, and seemed very much interested in Frank, for whom he prayed as 'his wayward brother.'—Yours very truly,

"G. W. ROGERS,
"Pastor Baptist Church, Austin, Texas."

We may add that we have no doubt that there are plenty of converts of the same type in Ray, Clay, Jackson, and Johnson Counties, Mo., which, no doubt, accounts in part for the exceeding dulness of real estate in that region.

It appears that Mr. Frank James, far from being dead, has put himself at the head of "a movement" which "has for its aim the extermination of all whose names are associated with the death of his brother Jesse." The gentlemen who are associated with him in this enterprise come from "the Missouri bottoms," or, in other words, the region which produced such politicians and social philosophers as "Polk Wells, Sil Norris, Jim Dougherty, John Pomeroy, and others," and they are reinforced by "a few tried mountain outlaws" from New Mexico. The movement involves, we are told, not only "the removal" of the two Fords, but "all informants and witnesses in Crocker Neck." It will thus be seen that the prospects of real estate in Missouri are not quite so good as the Governor thought they were after Mr. James had been killed. Indeed, it is safe to say that there will be no considerable rise in the value of farms in some parts of the State until the various "removals" which Mr. James is now contemplating have taken place.

The persecution of the Jews in Russia is going on with the old ferocity. The things which a few days ago occurred in the neighborhood of Odessa will form some of the darkest pages of this horrible and revolting story. It seems as if the Russian Government were either insincere in its proclaimed intention to put a stop to these disgraceful scenes, or as if it were powerless to do so. The latter is scarcely to be assumed. By way of contrast, it is very gratifying to observe that in Germany not only the anti-Jew movement has completely died out, but that very earnest demonstrations of sympathy with the suffering Jews in Russia, and active efforts to aid them, have taken its place. In Austria, too, organizations have been set on foot for the same purpose.

Sagasta has carried the ratification of his commercial treaty with France in the Cortes by a majority of 237 to 59, after a very exciting debate. The tariff question in Spain is curiously mixed up with various other questions, so that the division does not really represent the relative strength of freetraders and protectionists. Castelar, for instance, refrained from voting, though he is doubtless a freetrader, because his Republican supporters are mainly found in the great manufacturing towns, and the great manufacturing towns are nearly all in Catalonia, the manufacturers and artisans of which are almost ready to rise in arms for the tariff. The rest of Spain, however, which does not like the Catalonians, and thinks they have grown rich on their neighbors, and is immensely interested in the great increase in the French demand for Spanish wine, stands by the Minister. In fact, the Spanish wine trade is now growing at such a rate, in consequence of the failure of the French vines, that it is bidding fair to effect a complete economic revolution, and to set the country once more on its legs financially. The statistics of the exports to France—though they are doubtless nothing to what they will be under the new treaty—are quite sufficient to set the consumers of French wine all over the world to asking whether they would not do well to import the Spanish, and Hungarian, and Italian wines themselves, and do their own doctoring and mixing.

The Gladstone Budget is a less cheering document than was hoped for, but it is remarkably cheering considering what the outlook was two years or even a year ago. One of the most encouraging of the facts brought to light is that the falling off in the revenue derived from alcoholic drinks, which is considerable, does not this year indicate, as it has previously done, diminished income on the part of the laboring classes. It has hitherto been one of the discreditable features of British finance, that in good times the increase of revenue was derived largely from increased consumption of beer and spirits by the workingmen and women; while, on the other hand, in bad times a decline in the consumption of alcohol was usually accompanied by other evidences of poverty, such as diminished deposits in the savings banks. This year, however, decrease of revenue from alcohol has been accompanied by an increase of deposits. Next to the receipts from alcohol, nothing affords so good a test of the condition of the country as the income tax, but of this the report makes no mention. Two of the heaviest items of increased expenditure—one of $7,000,000, and one of $450,000—are the direct results of Beaconsfield's adventures in Afghanistan, Africa, and Cyprus. If he had been allowed to keep on for another year or two, he would probably have quadrupled them The Afghan War cost $100,000,000, which was as much wasted as if thrown into the sea.

The Irish Home Rulers have received a piece of support which must make a much deeper impression on the English mind than anything which has yet come from abroad, in the shape of an address to the Queen, voted unanimously by the Canadian House of Commons, testifying to the peaceableness, loyalty, and prosperity of the Irish in Canada, asking for the release of the suspects, and the bestowal on Ireland of the home rule to which Canada owes so much, and which the House thinks would do much to assuage that hostility to the Imperial Government which now diverts from Canada a large part of the Irish emigration. What will make this the more effective is that it reaches England just as another clamor for more coercion is beginning, or, in other words, for another passionate trial of a remedy which has failed in Ireland more conspicuously, and more frequently, than it has ever failed anywhere, and to which no civilized community would to-day advise England again to resort. If ever there was a case in which pure force on a great scale should not be appealed to, it is in a struggle against paying rent, on the part of a large population.

It would appear from Monday's despatches that the rumors which have been current for some weeks, that Mr. Gladstone would shortly announce a change in the Ministerial programme as regards Ireland, were true. The suspects, it is said, are all to be released, which was almost certain after the recent confession of both the Premier and Mr. Forster, in Parliament, that the Coercion Act had proved a failure. The summary powers of the magistrates are to be greatly increased, and something—really the most important thing of all—is to be done to relieve the tenants who are laden with arrears of rent contracted during the bad years, and which, if the Land Act had a retrospective effect, would undoubtedly be largely disallowed by the Commission. It is the evictions for non-payment of these arrears, which since the beginning of the year have put between three and four thousand persons out on the roadside, which more than aught else are keeping up the murders and outrages. The account given of them by Mr. Tuke, the English Quaker banker and philanthropist, who has lately visited the west of Ireland, is very shocking. He declares that he thinks the Government ought not to lend troops and police for purposes so barbarous, and when one reads his description of the condition in which the evictions leave helpless women and children, it abates a good deal of one's surprise at the savage ferocity with which the ejected tenants avenge themselves.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

Mr. William Henry Hurlbert, brother of the late Minister to Peru, appeared before the Shipherd investigating committee on Thursday. He testified that his brother consulted with him in regard to the letter from Shipherd offering him $250,000, and said that his brother had regarded it as a bribe and desired to have it immediately exposed, but the witness advised him to wait for further developments. In regard to the despatch with the marginal note, "Go it, Steve," the witness was not very clear. He said in substance that it might be in existence, and he had an "impression that a marginal note might have been made on a despatch to my brother," but the witness denied that he had such a despatch in his possession, or had shown it to Shipherd. On Monday Mr. Blaine appeared before the Committee, and flatly contradicted almost every assertion of importance that Shipherd had made in regard to him. He said he never saw, and knew nothing about, the papers alleged to be missing from the State Department, and that the statement made by Shipherd that he acquainted Mr. Blaine, at the interview on July 25, with the Hurlbut bribery letter, was unqualifiedly false. Mr. Blaine read letters from men whom Shipherd claimed as his counsel, and who he had said were informed of the bribery letter, denying any knowledge of the letter until after its publication. Mr. Blaine also expressed the opinion that President Garfield had died without having heard of the Peruvian Company, the Cochet claim, or Jacob R. Shipherd; and said that with Shipherd "falsehood is an employment and perjury a pastime." The further examination of Mr. Blaine was postponed until Wednesday.

On Thursday the President nominated Alphonso Taft, of Ohio, to be Minister to Austria; William L. Dayton, of New Jersey, to be Minister to the Netherlands; Nicholas Fish, of New York, to be Minister to Belgium; John M. Francis, of New York, to be Chargé d'Affaires to Portugal; J. P. Wickersham, of Pennsylvania, to be Chargé d'Affaires to Denmark, and Adam Badeau, of New York, to be Consul-General at Havana.

The Fitz-John Porter case was again under consideration at a Cabinet meeting on Thursday. General Porter has presented a new petition for relief from the sentence of the court-martial. It was referred to the Secretary of War.

The President has transmitted to Congress a note addressed by the Mexican Minister to the Secretary of State proposing the conclusion of a convention between the two countries for defining the boundary between the United States and Mexico from the Rio Grande westward to the Pacific Ocean by the erection of durable monuments. The Secretary of War has expressed himself favorably upon the proposition, and the President states that he deems it important that the boundary line as defined by the existing treaties, and already once surveyed, should be run anew and marked as suggested.

A bill was reported to the Senate on Friday to provide for the establishment of a Government for Alaska. It provides for the appointment of a Governor, in whom shall be vested executive power in and over the Territory; for a Secretary, who shall be ex-officio Treasurer, and prescribes that the judicial power of the Territory shall be vested in a Supreme Court and four inferior courts; that the Governor, Chief-Justice, Surveyor-General, and Marshal, together with the Collector of Customs of the district, shall for the first year of the operation of the Territorial Government be established a legislative council, with the Governor as ex-officio President. Sitka is to be the seat of Government. The bill further provides that the Territory shall be entitled to a delegate in the House of Representatives, who shall enjoy privileges similar to those enjoyed by other Territorial delegates, and that all male residents of the Territory, including civilized Indians, shall be entitled to vote.

Advices from Alaska state that all indications point to a rush of miners to that Territory during the summer, and lawlessness and bloodshed are anticipated unless some form of government is instituted there. Miners are arriving on every steamer, and they announce their intention of locating on quartz claims. In some instances they have already done so; and they say that as there is no law in the Territory they will hold their claims by force.

The Mississippi Improvement Bill has occupied the attention of the Senate during the week. On Friday Senator Morgan, of Alabama, made a speech against the bill, which, coming as it did from a Southerner, attracted considerable attention. "The Government has no right," he said, "to lay a specific tax on the people of Alabama to protect the people of the Mississippi Valley." The bill was passed on Tuesday without a division.

The Senate Committee on Commerce, on Thursday, at the request of Senators Hoar and Dawes, of Massachusetts, postponed consideration of the nomination of Roland Worthington to the Boston Customs Collectorship in order to afford the two Senators a convenient opportunity to be heard in opposition to the nomination.

Mr. Cannon, the Mormon delegate from Utah, made a speech in defence and justification of polygamy in the House of Representatives on Wednesday, but it did him little good, for the resolution to admit him to his seat was defeated by a vote of 123 to 79. Utah is now without representation in the House.

The House Committee on the Judiciary, after considering a number of bills to establish a uniform system of bankruptcy, has reported the bill known as the "Lowell Bill," which was introduced into the House by Representative Robinson.

A petition was received in the House of Representatives on Friday, asking Congress to take measures to prevent immigration of the Irish, and to pass a bill for this purpose similar to the Chinese Bill. The signers of the petition were said to be Orangemen.

In the case of Hallet Kilbourn against J. G. Thompson, ex-Sergeant-at-Arms of the House of Representatives, for damages claimed to have been incurred by Kilbourn through his arrest and confinement in jail by Thompson, the jury rendered a verdict of $100,000 damages for Kilbourn. Kilbourn was arrested in 1876 on a charge of contempt of the House of Representatives, and was confined in jail for forty-five days, and released under a writ of habeas corpus.

Secretary Folger stated on Thursday that the Treasury reserve, which is now more than thirty-nine per cent. of the United States notes outstanding, would undoubtedly be in such a condition that he would soon consider the propriety of making another call for bonds. The amount of reserve at the close of business on Wednesday was $136,069,502 26, over and above all liabilities except United States notes.

The Supreme Court in banc of the District of Columbia met on Monday. District Attorney Corkhill stated to the Court that the bill of exceptions in the Guiteau case had been signed and filed, and he asked the Court to fix an early date for hearing argument and deciding thereon. Mr. Reed, counsel for Guiteau, said he would like further time to prepare his argument, and asked that the hearing be set for three weeks from that day. The Court, however, believed that two weeks would give ample time for preparation. Mr. Scoville has written a letter formally announcing his withdrawal from the case, in which he says: "The imperative cause of withdrawal is my inability, without absolute ruin to my family and myself, to give further time to this cause away from home."

Mrs. Scoville announces that she intends to prepare a petition to the President for commutation of Guiteau's sentence to imprisonment for life, and travel round the country lecturing and circulating the petition for signatures.

The motion for a bill of particulars made by the counsel for the Star-route conspirators has been overruled by Judge Wylie. Another dilatory motion was made on Thursday to withdraw the plea of "not guilty" entered by the Court in the case of an ex-clerk of the Department indicted with Dorsey and Brady, so as to allow the arguing of a motion to quash his indictment.

The prosecution of the persons implicated in the election frauds in South Carolina is progressing successfully. On Wednesday the Grand Jury presented true bills of indictment against thirty-nine persons for conspiracy to obstruct qualified voters in the exercise of the rights of suffrage in the last general election. The jury charged with the case of the managers of the election at the Maysville precinct, however, were discharged on Monday, owing to their failure to agree upon a verdict.

The Committee on Trade of the Cotton Exchange, which has been investigating the charges of fraud in the cotton packed this season, has made a report to the effect that the complaints, though not without foundation, are much exaggerated; that the adulteration is not intentional, but is due to a variety of causes; and that the general agitation of the subject cannot fail to have a beneficial effect.

The Oregon Republican State Convention met on Thursday and nominated a Congressman and State officers. The platform declares that the Hawaiian Reciprocity Treaty is an imposition on the Government and people, and should be abrogated; deplores the assassination of President Garfield; regards the President's veto of the Chinese Bill as unwise and unjust; condemns the policy which prompted it, as opposed to the principles of the Republican party as expressed in the platform of the last National Republican Convention, and demands that the Representatives of Oregon in Congress shall persist in advocating the restriction of Chinese immigration.

The revenue steamer *Corwin* has been sent to the relief of the officers and crew of the *Rodgers* at Tiapka. The *Corwin* is to sail for Tiapka as soon as the condition of the ice in the northern seas will permit, and will transport Captain Berry and his party to the nearest port visited by a regular line of steamers, so that they can be brought home at the earliest moment.

Monticello, Louisiana, was visited on Saturday afternoon by a destructive cyclone. Only three houses were left standing, and ten persons were killed instantly; and advices from several counties of North Carolina, Georgia, and Alabama report cyclones which caused great damage to property and considerable loss of life.

There have been great floods in the Red River Valley in Manitoba. On Wednesday last the flood reached the city of Winnipeg, and did great damage. Bridges were swept away, telegraphic communication cut off, and parts of the city flooded.

Indian troubles have begun in Arizona, where not less than forty persons have been killed, and news has been received of several massacres of the inhabitants of sheep and cattle ranches. The hostile Indians are reported to be Chiricahuas, and number about 300. They are moving south, probably with the intention of getting into Mexico, but it is hoped that the troops will be able to prevent their escape. A mass meeting was held at Safford, Arizona, on Monday evening, Governor Tuttle presiding, and it was decided to raise a force of volunteers to take the field for two or three months.

FOREIGN.

Charles Robert Darwin died at his residence, Down House, near Orpington, England, on Thursday. He will be buried in Westminster Abbey, near Sir Isaac Newton. Canon Liddon, preaching at St. Paul's Cathedral, and Canons Prothero and Barry, at Westminster Abbey, on Sunday, referred to Mr. Darwin's theories, and said they were not necessarily hostile to the fundamental truths of religion. A London despatch says that these sermons are looked upon as in wonderful contrast to the reception first given Mr. Darwin's doctrines by the religious world.

Mr. Gladstone introduced his budget in the House of Commons on Monday. In his speech he said the actual surplus of revenue over expenditure for the past year was £352,000. The actual expenditure for the last year had been £718,000 less than the estimates, but a comparison of the expenditure of 1881–82 with that of 1880–81, showed an augmentation of more than £2,250,000. The condition of trade could not be called unsatisfactory, but the effect of the improvement upon the revenue of the country was sluggish. This he attributed not to a diminution of the resources of the country, but to the absence of the extreme prices which had marked the previous period of prosperity. He regretted the growing popular indifference in regard to increase of expenditure, and thought the system of framing estimates on the sole responsibility of the Ministers had not worked satisfactorily. The Americans, he said, had shown extraordinary vigor and fortitude in reducing their debt, and in bearing heavy taxation for that purpose, and their record in this respect compared favorably with that of England of late years. The revenue for the coming year was estimated at £84,935,000, showing an estimated surplus of £305,000, which surplus was so small as to force him to abandon the hope of great financial readjustment in connection with the County Government Bill; and in order to fulfil promises in regard to the readjustment of the highway rate, he proposed to raise £250,000 more by a slight increase in the carriage duty. This was the only novelty in the budget. Mr. Gladstone concluded by assuring the House and the country that he had concealed nothing. Sir Stafford Northcote said he would defer criticism on the budget and on the speech.

An angry debate took place in the House of Commons on Thursday on Irish affairs. A circular had been issued by an Inspector of Police, declaring that as there was reason to believe that every means would be used to assassinate a certain Mr. Lloyd, who had been very active in opposing the "no-rent" movement, it behooved his escort to prevent it and to use firearms on the bare possibility of such an attempt. Mr. Sexton said this circular was a gross and barbarous incitement to murder, and he called upon Mr. Forster to insist upon its withdrawal. Mr. Forster defended the circular, although he confessed that one or two paragraphs of it should not have been written. He said that cowardly ruffians who were likely to shoot from behind a hedge would abstain if they thought themselves in danger. During the debate Mr. Redmond persisted in denouncing Mr. Forster as dishonest, upon which the Speaker named him, and his suspension was voted by 207 yeas to 12 nays. Sir Stafford Northcote said he hoped the Government would continue to protect Mr. Lloyd, and declared that the Opposition would do nothing to weaken the Government in Ireland. Mr. Forster has, however, since withdrawn the circular.

There has been a slight lull in the business of outrages in Ireland. Mr. Smythe, member of Parliament for Tipperary, in reply to a vote of censure passed on him by the priests of Tipperary for not supporting the Land League, violently denounced the League, and declared that until its conspiracy is demolished, root and branch, Ireland will have no peace. Mr. Parnell arrived at Kilmainham Jail on Monday evening. He was loudly cheered at the Dublin station, but avoided, as far as possible, any demonstration. It is reported that while in London Mr. Parnell had a conference with leading Home Rulers.

In the House of Commons on Monday, Sir Charles Dilke, replying to questions, said that the correspondence relative to the American suspects would be presented to Parliament this week, and that the Government had no intention of introducing a bill to enable them to deal with alien suspects. The question of the American suspects has been discussed in the English newspapers during the week. The *Standard* said on Monday that the speedy release of the suspects on terms that might involve the recall of Mr. Lowell—whatever that may mean—the gradual release of all political suspects, and the trial of those detained upon suspicion of complicity in outrages, the substitution for the Coercion Act of a large increase of summary jurisdiction vested in magistrates, and the amendment of the arrears and purchase clauses of the Land Act, are the principal features of the ministerial programme.

The Cabinet Council on Saturday discussed Mr. W. H. Smith's resolution for extending the purchase clauses of the Land Act. It is understood that the Cabinet resolved cordially to accept the assistance of the Opposition in carrying out practical legislation in this direction.

On Wednesday evening the House of Commons considered a bill introduced by Mr. Ashton Dilke, which proposes to throw upon the community the expenses of the returning officer in conducting a Parliamentary election. The bill also provides that a candidate must obtain an absolute majority of the votes recorded or submit to a second ballot. This measure, which is supported by the Government, passed its second reading by a vote of 87 to 85.

The Grand Jury returned a true bill for high treason against MacLean, who attempted to shoot Queen Victoria at Windsor on the 2d of March, on Wednesday. He was at once placed in the dock and pleaded not guilty. Sir Henry James, the Attorney-General, opened the case for the prosecution, and Mr. Montague Williams for the defence. Mr. Williams said it could be proved that MacLean had had the homicidal mania for years, and had been confined in an asylum. The Superintendents of the Salisbury and Broadmoor Asylums testified to MacLean's insanity, and said they believed him incapable of appreciating the nature or quality of any of his acts. Mr. Williams asked for his acquittal on the ground of insanity. Lord Chief-Justice Coleridge summed up the case, and the jury, after being out only five minutes, returned a verdict of not guilty, on the ground of insanity. On Thursday it was ordered that MacLean be detained in custody during her Majesty's pleasure.

A meeting was held at the Mansion House in London on Thursday in furtherance of the proposed fisheries exhibition at London in 1883. Mr. Lowell, the American Minister, said he had grounds for believing that his Government would participate in the affair. He said he had that morning transmitted by cable to Washington the formal invitation.

In London, on Wednesday, a great number of persons wore primroses, Lord Beaconsfield's favorite flower, that day being the anniversary of his death.

The Spanish Chamber of Deputies has approved the Franco-Spanish Commercial Treaty by a vote of 237 to 59. On Monday a motion of censure against Señor Comacho, Minister of Finance, was rejected by a vote of 152 to 46. An anonymous proclamation, dated Barcelona, has been addressed to the Senators and Deputies, threatening with death those who vote for the treaty.

The French Cabinet Council has approved the scheme of M. de Lesseps for cutting a canal through the neck of land dividing the Gulf of Gabes from the salt marshes and low-lying parts of the Desert of Sahara to the south of Tunis. It is suggested that if this canal be cut, the sea will once more fill up the Desert of Sahara. The political advantage to be gained by the scheme will be the insulation of Tunis and Algeria by creating a water barrier between them and Tripoli. The cost of the canal is estimated at 65,000,000 francs.

The Corporation of Marseilles, in France, has brought a suit against the ex-Empress Eugénie to compel her to relinquish possession of the Imperial château which was presented under the Empire to the late Emperor by the municipality, but which, it is claimed, now belongs to the town.

The new cable connecting Emden, Germany, with the Anglo-American cable system at Valencia, was opened on Saturday. The new line forms a direct link between the Empire of Germany and the United States. Congratulatory messages were exchanged between the Emperor and President Arthur.

The editor of the *Tageblatt*, who was recently sentenced to three months' imprisonment for libelling Prince Bismarck, has been sentenced to another week's confinement for inserting a letter in his paper about M. Gambetta, which the court held to be blasphemous. At the instance of Prince Bismarck also, the circulation of one of the minor comic papers in Berlin has been suspended for two years.

A newspaper in Vienna publishes an account received from the frontier which says that previous to the arrival of the Governor of Podolia at Balta, the Russian troops there aided in plundering instead of assisting the Jews. Forty persons were seriously injured during the progress of the riots, some of whom have since died. Fully a thousand houses were destroyed, and the damage done is estimated at 4,500,000 rubles.

An imperial order has been promulgated in Russia prohibiting military men from publicly delivering political speeches, or expressing political opinions, and War Department officials are prohibited from publishing, without the sanction of their superiors, documents referring to the internal and external affairs of foreign countries.

Osman Pasha Rafki, formerly Egyptian Minister of War, who ordered the arrest of the officers who participated in the military revolt of a few months ago, has been arrested on the charge of complicity in the plot to assassinate Arabi Bey. Just as the Court was about to pass sentence on the Circassian officers implicated in this plot they were again arrested in consequence of the reception of evidence that they had been intriguing to procure the restoration of the ex-Khedive.

Montero is now President of Peru, and has resigned all military authority, having conferred ample powers for that purpose upon Don Miguel Iglesias, who was Minister of War under the Prado Administration and Pierola Dictatorship. The Chilians are undecided whether to treat with Montero or not. The latter is making efforts to unite all the various revolutionary leaders who have sprung up in Peru lately, and if he succeeds in doing so he will satisfy the doubts of the Chilians as to the possibility of forming a Government of Peru outside of their own lines.

A resolution was offered in the Canadian House of Commons on Friday, setting forth the desirability of Canada negotiating directly her own commercial treaties, and not, as at present, through the British Foreign Office. Mr. Blake, who offered the resolution, said the history of British diplomacy, so far as Canada was concerned, had been a history of error, wrong, blunder, and concession. In the debate that followed Mr. Mackenzie supported the resolution, which was, however, defeated by a vote of 104 to 58.

TUESDAY, April 25, 1882.

THE PERUVIAN MYSTERY.

THE testimony given by Mr. Hurlbert, of the *World*, on Thursday, before the House Foreign Affairs Committee was important in more ways than one. He produced a letter from his brother, General Hurlbut, to himself, which is very valuable as showing the impression made on the mind of the former by Mr. Blaine's despatches. The letter is as follows:

"The Chilian papers are full of that infernal Shipherd and his pretences. They have been kicked out of this legation and out of the State Department; but he is an indefatigable nuisance. I hope Sam Randall will call for all papers in the department in reference to him and his affairs. I have sent all his letters back to the department, and I anxiously desire that the correspondence be made public. I have fears (I hope not well grounded) that our Government means to slide out of the American position here. My personal talk with Blaine and Garfield, of course, will not appear in any official correspondence, but it was the motive for my action. I think they will throw me overboard unless Congress backs up the American line I have taken here. Personally I care little about it, but I must say that in Blaine's letter of the 22d of November to me there was a manifest disposition to hedge."

It must be said that this interpretation of the despatch of November 22 was not unnatural. Down to this time there is no indication in the correspondence of any desire on the part of Mr. Blaine to interfere with "Steve's" general diplomatic operations, which are easily explicable as having been the result of "personal talk" with the Secretary of State, but are unintelligible in the light of his formal instructions.

His instructions were explicit on the point that the United States "cannot refuse to recognize the rights which the Chilian Government has acquired by the successes of the war," and that "a cession of territory" might be "the necessary price to be paid for peace." Now, what General Hurlbut had actually done had been to announce to Admiral Lynch, the Chilian commander, in a "memorandum," that the United States would "regard with disfavor" any annexation of Peruvian territory; to write a letter to Garcia, the secretary of Pierola, Calderon's rival, with whom he had not even the right to hold diplomatic intercourse on such a subject, announcing, as if by authority, that Calderon would not cede Tarapaca to Chili under any circumstances; he had also telegraphed to our Minister to the Argentine Confederation, suggesting that the latter Government should send a minister to Peru, there being at the time a serious outstanding difference between Chili and the Argentine Confederation. For every one of these things Mr. Blaine, in his despatch of November 22, found grave fault with Mr. Hurlbut, and notified him that he was to be superseded by a special envoy.

Why should Mr. Blaine have written such a despatch as this? Hurlbut's idea is that it showed that he wanted to "hedge"—*i. e.*, that he was afraid the active diplomacy of his emissary was going too far, and that he wanted merely to throw him overboard and set himself right. But the subsequent events show that this was by no means all. Hurlbut had accomplished one thing of great importance; he had, by his despatches, "memorandum," and pronunciamientos on the subject of the terms of peace, managed to put Calderon, who from the first had been a mere diplomatic puppet, ready to do anything suggested to him for the government which had created him, in the attitude of resisting all idea of territorial cession. Calderon had accordingly been arrested and carried off to Santiago. Notwithstanding this, and notwithstanding the declaration of martial law by the Chilians, and the non-existence of any actual Peruvian government in Peru, Hurlbut was still directed by Mr. Blaine to go on recognizing "any legitimate representative" Calderon might have left behind him. A few weeks later the publication of the instructions to Mr. Trescot appeared, and made the meaning of this obvious. Mr. Trescot was instructed to demand an explanation of the arrest of Calderon from Chili; and this was accompanied by the announcement that the arrest was regarded as an insult to the United States.

It thus appears probable that from the first it had been Mr. Blaine's intention to embroil this country with Chili. This explanation of his behavior is further strengthened by the fact that as long ago as August 15, Kilpatrick, who had taken to Santiago instructions agreeing with those which Hurlbut took to Lima, reported that Chili acceded to all the demands of the United States—in the language of the Chilian Secretary of State, "out of respect for the opinion of the Administration at Washington"—and agreed that no territory should be exacted unless other means of indemnifying Chili failed. Notwithstanding this, "Steve" was allowed to continue ranting and blustering on Calderon's behalf, until the Chilians, to put an end to the farce, were forced to throw the latter into prison. That this was exactly what Mr. Blaine wanted can hardly be doubted. It furnished him, as he thought, with a "casus belli" against Chili, while he was enabled, at the same time, to repudiate all responsibility for Mr. Hurlbut. He had used him to drive Chili into taking a stand, just as he had previously allowed Shipherd to use his wonderful claims to make it appear that the United States had a material stake in the contest. That he should apparently have thought he had now got the Chilians "just where he wanted them," is not the least curious or characteristic fact in the history of his proceedings.

The testimony given by Mr. Blaine on Monday was effective only in showing Shipherd to be an irreclaimable liar. The late Secretary of State denied emphatically that he had ever heard from Shipherd anything about his offer of $250,000 "pool stock" in the Peruvian Company to General Hurlbut, and produced a letter from Senator Blair, who, according to Shipherd, was present at the interview at which the subject was mentioned, corroborating his denial. Shipherd's story of his having discussed the offer generally with his various "counsel" was upset by the production of letters from Messrs. Boutwell, Robertson, and others denying that they had ever heard of it. His mendacity was further shown by a letter from Mr. Evarts with regard to an "opinion" on the Cochet claim, relied on by Shipherd as part of his "case." This was to the effect that "if Cochet was the discoverer of guano, his discovery vested in him the title to one-third of all the guano in Peru, and he may at his option claim one-third of each heap, or any other equitable one-third of the total." Mr. Blaine produced a letter from Mr. Evarts denying that he ever gave Shipherd or any one else an opinion as to the validity of the Cochet claim. Mr. Elmore, the Peruvian Minister, has also written a letter denying the story about the "marginal-note" despatch.

So far, therefore, as Shipherd is concerned, his attempt to "jump on Jim Blaine" must be regarded as a failure. But Mr. Blaine's attempt to explain his own action as Secretary of State is not helped by showing that Shipherd has perjured himself.

He says that the Cochet claim, represented by Shipherd, is entirely separate from the Landreau claim, the recognition of which he urged in his despatches to General Hurlbut. This is true; but the important question is whether Mr. Blaine did not allow Shipherd for months to suppose that if he, Shipherd, could get a sufficient backing, he might secure the good offices of the State Department? It was a natural part of his general plan to take advantage of any "American" claims that could be used to threaten Chili with. If not, why did Mr. Blaine make no attempt to find out what was the basis of the Cochet claim at the time that Shipherd called upon him? He seems to have regarded Shipherd's "backing" as very good, for he brings up the names of his various "counsel" and alleged "copartners" as a reason for having listened to him at the outset. He made no attempt at the time to find out the truth as to the extraordinary "opinion" attributed by Shipherd to Mr. Evarts, nor, indeed, to find out the truth about his story in any respect. He made Shipherd's acquaintance in July of last year. It was not till December that he became aware, as he wrote to General Hurlbut, of the "indecency and dishonor" of his advocacy of the Cochet claim.

His testimony with regard to the Landreau claim is very significant. This he admits urging; and to explain his action he misrepresents in a shocking manner all the facts of the case. A resolution recommending the claim to the attention of the President once received, as he says, the unanimous vote of the House of Representatives, and it was subsequently thrown out by the Senate as a purely executive matter. Secretary Fish wrote two or three letters about it, in which Mr. Blaine says he "commended" this claim; but, as a matter of fact, the utmost length to which he ever went was to permit our Minister at Lima to urge "unofficially" a "speedy investigation of it." It had also "been reported upon by Mr. Evarts." On the strength of such facts as these Mr. Blaine boldly declares that "in the history of claims in the United States there has not been any claim in the State Department so strongly backed and endorsed by precedent and power as that was." It was with regard to this claim that Mr. Blaine instructed Mr. Trescot on December 16: "While disabusing the mind of the Chilian Government of any impression that the United States meditates intervention on behalf of private claims, beyond the use of its good offices, you will say that justice seems to

demand that Landreau should have an opportunity to be heard in support of his claim before a tribunal in Peru competent to decide it; and that if decided in his favor, a treaty of peace which might cede territory to Chili should not be made in disregard of any rights which Mr. Landreau may be found, after an impartial judicial investigation, to possess." As there were no courts in Peru at the time, the construction put by Mr. Belmont on this—that it was in effect saying that there should be no treaty of peace without a recognition of the Landreau claim—seems much less far-fetched than Mr. Blaine seeks to represent it.

On the whole, Mr. Blaine's testimony does not weaken the impression that his plan was to use these "claims" to force a quarrel upon Chili. He let Shipherd use the Cochet claim, and threw him over when he had used it long enough.

ALIENS AND NATIVES UNDER THE IRISH COERCION ACT.

THE discussion in England over the position of the imprisoned Irish-American suspects continues, and is certainly sufficiently confused to bewilder any ordinary reader. Two or three of the principal journals admit that the United States are within their rights in insisting that their citizens shall not be imprisoned for an indefinite period without trial; but most others, the London *Standard* among the number in a recent issue, maintain that no foreigner is entitled to any discrimination whatever in his favor in the administration of the law of the land, and that it is preposterous for him to demand it. There is as yet no sign of any general consensus of English opinion on the subject. This is the more surprising because, in spite of the interest the question is exciting on both sides of the water, nobody has as yet been able to cite a single precedent, or a single dictum from any of the text-books of international law, in support of the doctrine that the municipal law of any country can authorize its executive to imprison foreigners without trial in time of peace. If there is any respectable authority for the practice, if it has ever been formally acquiesced in with regard to its own citizens by any Christian state, it ought to be easy to produce the despatch in which its reasonableness or inevitableness was acknowledged. But nothing of the kind is forthcoming.

The text-books and diplomatic correspondence teem with admissions that a foreigner owes obedience to the laws of the country in which he has taken up his abode, and must submit to whatever punishment they prescribe for their violation. Nowhere has this principle been admitted more fully than by Mr. Marcy in discussing the Tausig case, in 1854.

> "Every nation," said he, "whenever its laws are violated by any one owing obedience to them, whether he be a citizen or stranger, has a right to inflict the penalties incurred upon the transgressor, if found within its jurisdiction. The case is not altered by the character of the laws, unless they are in derogation of the well-established international code. No nation has a right to supervise the municipal code of another, or claim that its citizens or subjects shall be exempted from the operation of such a code, if they have voluntarily placed themselves under it. . . . This principle does not at all interfere with the right of any state to protect its citizens, or those entitled to its protection, when abroad, from wrongs and injuries, from arbitrary acts of oppression, or deprivation of property, as contradistinguished from penalties and punishments incurred by the infraction of the laws of the country within whose jurisdiction the sufferers have placed themselves."

This is all indisputable, but it is none the less true that this rule is, and always has been, based on the assumption that the question whether a foreigner has violated the laws of the country in which he resides shall be determined by some sort of judicial inquiry before the punishment is inflicted; that is, there must be a trial before some sort of tribunal in order to ascertain whether he is really a "transgressor," and whether he is really guilty of the "infraction." The law may be, in our estimation, an unwise, or unnecessary, or cruel law, and the people who live under it much to be pitied; but of these things we have no right to complain. When, however, it is alleged that one of our citizens has broken it, we are bound to ask that the facts shall be ascertained by a trial, whether it be before a jury or a single judge, before a lawyer or a layman.

Now a trial does not mean simple accusation; it means an accusation followed by proof, and it means the communication of the evidence to the accused, the concession of reasonable time and opportunity for the production of counter-proof, and the submission of the whole matter to some sort of judge, whose character and position guarantee his fairness. Imprisonment inflicted on mere accusation, without proof, and for an indefinite period, is not a punishment, in the sense in which the term is used by legal writers. It is not a penalty inflicted for the commission of an offence; it is a penalty inflicted on A because B thinks him a dangerous or objectionable person. It is therefore arbitrary, and because arbitrary, oppressive. It is not a whit less objectionable than the seizure of a man's property on suspicion. If Mr. Forster were to distrain the goods of an Irish-American, and sell them at auction, and pay the money into the British Treasury, because he suspected him, or some policeman suspected him, the act would not be made a whit the less obnoxious by his calling it the levying of a fine, or because British citizens were subjected to the same process. The citizens of every country submit to everything at the hands of their own Government which it thinks necessary to its safety, either because they acquiesce or because they have no remedy. But foreigners have a remedy, as Mr. Marcy says, against acts of oppression or deprivation of property, and it consists in an appeal to their own Government to procure them a trial by proof, and acquittal in case the proof is not forthcoming.

The British Government, in short, would be entirely within its right in passing laws of the most stringent severity against "no-rent" preaching, or the intimidation of landlords or tenants, against discouraging people from resorting to the Land Courts, against being out after dark, against possessing arms, against wearing a green coat, against speaking disrespectfully of the Ministry, or against the promotion of Irish discontent by any overt act whatsoever; and an American citizen sojourning voluntarily in Ireland would have no right to complain. But the minute he is put in jail on an accusation of violating these laws he has a right to demand, if need be through his Government, that the nature of the accusation and the evidence on which it is based shall be produced before a tribunal competent to order his release in case the charge against him is not substantiated. There is no such thing known in the usage of Christian nations as the lawful infliction of arbitrary punishments on resident foreigners. However worthless the Irish-Americans whom Mr. Forster has locked up may be, or however desirable it may be that they should be in jail somewhere, there is nothing in their case, or in the nature of the troubles with which the English Government is now contending in Ireland, to warrant us in allowing anything of the kind in the present instance to be established as a precedent.

There is all the less reason for our doing so because such inconveniences as the presence of foreigners in Ireland is now causing the British Government, are clearly chargeable to negligence in not guarding against them in the drafting of the Coercion Act. The Ministry were fully warned by the Fenian troubles in 1866 of the extent to which Irish discontent was fostered, and likely to be fostered, by the presence of Irish-American agents on Irish soil in the anti-rent crisis. It is surprising, therefore, and not very excusable, that there should have been no special provision made for them in the Act. There is in the history of British legislation plenty of precedent for disposing of suspected or troublesome aliens by simple expulsion from British soil. In fact, it is in this way that aliens whose presence was considered dangerous, but who could not be convicted before the courts of any definite offence, have always hitherto been got rid of, and there is no way less open to objection. It may, of course, be a great hardship and injury to a foreigner to be thrust forth from a country in which he is resident, on mere suspicion or for reasons of state; but it is something of which his Government cannot complain, especially if the natives are at the same time exposed to arbitrary imprisonment, because the right to exclude foreigners from coming into a country, or to eject them from it if their presence is considered dangerous, is one of the fundamental natural rights of which no community can be divested by any usage however prolonged. The British Parliament armed the Executive with the power of expelling aliens from 1793 down to 1826. In 1848, when the foreign refugees of that year were thought likely to make trouble, it gave the Cabinet the same power again for a short time, though no use was made of it. The Coercion Act ought to have contained a renewal of it as regards Ireland, if the Ministry wished to avoid diplomatic complications with this country. Had it done so, and were the Irish-American suspects now punished by being carried on board a steamer at Queenstown, with a ticket for New York, nobody would have a right to complain, and nobody would complain except those Irish-American publicists on this side of the water who hold that an Irishman's "papers" entitle him to American protection while actively and openly engaged on British soil in trying to overturn the British Government.

CHARLES DARWIN.

THE death of Mr. Darwin on Thursday of last week cannot be called either sudden or premature, as we ordinarily use such expressions, because his health was known to have been for some time feeble, and not only had he more than completed his three-score-and-ten years but his life had been rich in achievement, and crowned with success such as has seldom been vouchsafed to mortal man. The news of his death must, nevertheless, have impressed every one with a sense of sudden bereavement, for the world never gets ready to lose such a man; and when we consider how fresh Mr. Darwin's mind was, and how much more he would have been sure to do if he could have lived to the age of Hobbes or Fontenelle, we must really characterize his death as premature. The great book of which the 'Origin of Species' was designed as a preliminary sketch, he had indeed given up all thought of writing, because so much had been accomplished by the preliminary sketch that further work upon the general theory might well be left to other hands, the whole scientific world having become, to a great extent, Mr. Darwin's collaborateurs. But during the last years of his life Mr. Darwin has published several monographs of the highest value and interest, summing up the results of half a century of patient observation and sagacious reflection upon sundry obscure but important points in botany and vegetable physiology, and there is no reason for supposing that he had as yet begun to exhaust this treasure-house of rich experiences. On the contrary, it seems quite likely that he may have left behind numerous notes and fragments, from which valuable posthumous papers may be edited.

The career of Mr. Darwin possesses the interest that belongs to a complete and well-rounded tale. Like his great predecessor and ally, Sir Charles Lyell, he was never obliged to contend with pecuniary anxieties or to engage in any bread-winning occupation, but he was able to devote his whole life with a single mind to the pursuit of scientific truth. It therefore became possible for him to furnish an admirable illustration of Buffon's definition of a great life, "une pensée de la jeunesse réalisée dans l'âge mûr." After taking his Master's degree at Cambridge, in 1831, at the age of twenty-two, he set out in the ship *Beagle* on an exploring voyage around the world, accompanying the expedition voluntarily as naturalist. In the course of this voyage Mr. Darwin was struck by the peculiar relations of the floras and faunas of the Galapagos Islands to one another and to the flora and fauna of the South American Continent, and these facts set him to speculating as to the possibility of an actual kinship among these organisms—a question which involved the whole problem of the origin of species by "descent with modifications." The most considerable part of Mr. Darwin's life-work was comprised in the solution of the problems thus early suggested by the study of the Galapagos Islands. But a long time was to elapse before the world was to hear, either of the problems or of the solution. After his return to England in 1836, Mr. Darwin was for some time occupied with publications describing the scientific results of the expedition, in which he was assisted by Owen, Waterhouse, Bell, Hooker, and other eminent naturalists. In the series of volumes which appeared under his direction between 1840 and 1846, three were by Mr. Darwin's own hand—the 'Geological Observations on South America,' the work on 'Volcanic Islands,' and especially the treatise on 'Coral Reefs,' in which the true theory of the formation of the reefs was for the first time propounded, and in which new light was thrown upon areas of subsidence and of elevation in all parts of the globe. In 1851-53 Mr. Darwin published a 'Monograph of the Cirripedia,' and at about the same time monographs of the fossil *balanidæ*, *verrucidæ*, and pedunculated cirripeds of Great Britain. In 1853 he received the royal medal from the Royal Society, and in 1859 the Wollaston medal from the Geological Society, and by this time his name had already come to be ranked with those of the most distinguished living naturalists, so that when the 'Origin of Species' was published it at once attracted attention by reason of the eminence of its author, even before its transcendent merits had had time to become known.

A quarter of a century had now elapsed since Mr. Darwin had turned his attention to the problem of the origin of species in connection with the facts of geographical distribution and geological succession. Fifteen years had passed away since he had written out, without publishing, a brief sketch of some of the principal points of the theory which has since become so famous. How much longer this silence might have lasted, had not an unforeseen circumstance come in to break it, one cannot say; but no doubt it would have lasted some time longer, for Mr. Darwin did not wish to publish his views until he had thoroughly considered all the leading facts and arguments which might be regarded as bearing upon them, and it is quite evident that when he wrote the 'Origin of Species' he did not realize the wonderful maturity which his argument had attained, or the overwhelming cogency with which he was then presenting it. It was quite characteristic of him to have made so many allowances for the inevitable incompleteness of his work, when judged by a standard of absolute perfection, as to render himself incapable for the time being of appreciating its real magnitude. In writing the 'Origin of Species,' he regarded it as a preliminary outline of his theory, which would serve to prevent his being forestalled by others in the announcement of it, and he made frequent allusion to the larger and more elaborate treatise by which he should presently follow up the exposition. There can be no doubt that Mr. Darwin was surprised at the great fame which his book instantly won, and at the quickness with which it carried conviction to the minds of nearly all men living whose opinions on the subject were worth the trouble of influencing. The success of his theory was instantaneous and complete; and before ten years more had passed by, so many able men had become expounders and illustrators of the doctrine of natural selection that it no longer seemed necessary to write the larger and more elaborate treatise. The learned work on the 'Variation of Animals and Plants under Domestication,' which appeared in 1868, in two octavo volumes, formed the first instalment of this long-projected treatise. The second part was to have treated of the variation of animals and plants through natural selection, and a third part would have dealt with the phenomena of morphology, of classification, and of distribution in space and time. But these second and third parts were never published.

The circumstance which caused Mr. Darwin to publish the 'Origin of Species' in 1859 served, no less than the extraordinary success of his book, to show how ripe the world had become for the publication of such views. In 1858 Mr. Wallace, who was engaged in studying the natural history of the Malay Archipelago, sent to Mr. Darwin a paper in which he sketched the outlines of a theory identical with that upon which Mr. Darwin had so long been at work. Coincidences of this sort have not been uncommon in the history of scientific inquiry; nor is it surprising that they should occur now and then, when we reflect that a great and pregnant discovery must always have close relations with some question which many of the foremost minds in the world are busy in thinking about. It was so with the discovery of the differential calculus, with the interpretation of the Egyptian hieroglyphics; and to a considerable extent it was so with the introduction of the new chemistry, with the discovery of the equivalence of heat and motion, and with spectrum analysis. It was peculiarly so with the doctrine of the origin of species through natural selection. The belief that all species have originated through derivation from other species, and not through special creation, had been held by a certain portion of the scientific world ever since the time of Mr. Darwin's famous grandfather, who was one of its earliest and most conspicuous advocates. Even those naturalists who did not hold this belief cannot in general be said to have held any antagonistic belief, inasmuch as the so-called "doctrine of special creations" is not a positive doctrine at all, but a mere confession of ignorance, and was so regarded by scientific naturalists before 1859. The truth is, that before the publication of the 'Origin of Species' there was no opinion whatever current respecting the subject that deserved to be called a scientific hypothesis. That the higher forms of life must have come by some process of development from simpler forms was in itself a sensible—perhaps the only sensible—view to take of the subject; but there is nothing properly scientific in a vague general opinion of this sort. A scientific hypothesis must allege a true cause whereby to account for a group of phenomena. Before 1859 no one had suggested a true cause for the origination of new species, but the problem was one over which every naturalist had puzzled since the beginning of the century. Hence the completeness and swiftness of Mr. Darwin's success. But Mr. Darwin's originality was as complete as his success, and it embraced the entire scientific conception of the development theory. He did even more than allege a *vera causa* in natural selection. He was the first to marshal the arguments from classification, embryology, morphology, and distribution, and thus fairly to establish the fact that there has been a derivation of higher forms from lower; and he was also the first to point out the *modus operandi* of the change. The first of these achievements by itself would have entitled him to associate his name with the development theory, but by the second the triumph of the theory was practically assured.

It is a remarkable illustration of the thoroughness with which Mr. Darwin considered his great theory before publishing an account of it that, during the twenty-three years which have elapsed since 1859, although a vast literature of controversy has come into existence and "Darwinism" has formed one of the chief subjects of discussion in all the civilized countries of the world, no one as yet seems to have discovered any argument against the theory of natural selection which Mr. Darwin had not himself already foreseen and considered in the first edition of the 'Origin of Species.' In 1871, Mr. St. George Mivart published a book which made a slight sensation for a few weeks, and which deserves notice as an attack upon the Darwinian theory couched in the language of scientific argument rather than in that of general philosophy or theology or æsthetics; yet all Mr. Mivart's serious objections were taken from Mr. Darwin's own pages and freshly urged with singular want of candor.

After an interval of twelve years Mr. Darwin followed up the first announcement of his general views with his treatise on the 'Descent of Man.' If his earlier book was preëminent for the skill with which it grouped great masses of

facts in their bearings upon a few general propositions relating to the whole organic world, the later treatise is no less remarkable for the skill with which it weighs great numbers of different and often heterogeneous considerations in their bearings upon a single enormously complex group of phenomena. Mr. Darwin's latest books belong to a period in which, having lived to witness the complete success of his great work, he has employed his time in recording the results of his researches on many subsidiary points of no little interest and importance. The treatises on 'Insectivorous Plants,' on 'Cross and Self-Fertilization,' on the 'Different Forms of Flowers,' and on the 'Formation of Vegetable Mould,' should be read as models of sound scientific method, by every one who cares to learn what scientific method is.

There can be little doubt that Mr. Darwin's name will go down in history as that of the greatest scientific inquirer and the most pregnant scientific thinker that has lived since Newton. Since the beginnings of modern learning, probably no single idea has wrought upon the minds of men with such rich and manifold results as the idea of "natural selection"; and it is evident that what we have already seen is but an earnest of vastly more that is to come.

MATERNA AND PATTI.

Frau Materna, the original *Brünnhilde* of the Wagner festival at Bayreuth, arrived at this port on Saturday. It may be considered perhaps a prophetic and certainly a suggestive coincidence that the most gifted interpreter of modern German music should have embarked for this country only a few days after the leading vocalist of the Italian school had left us. Americans will have an opportunity of comparing within a few weeks the vocal styles of the greatest living lyric and the greatest living dramatic soprano. Unfortunately neither of the two will have been heard under the most favorable circumstances, Mme. Patti having appeared only as a concert-singer in costume—since her operatic company was a mere delusion and snare—and Frau Materna, who is almost as great an actress as she is a vocalist, being engaged only for the concerts at the May Festivals in New York, Cincinnati, and Chicago, where, it is true, she will appear amid the most artistic surroundings, but under somewhat unfavorable acoustic conditions. Were operatic affairs in New York on the same plane of excellence as concert matters, both of these great vocalists might have been heard in their proper sphere; but as this is not the case, we must feel grateful for an opportunity of comparing at least their purely vocal endowments and styles. Among other things, the prevalent erroneous opinion will be corrected that the Italian method of singing is the only correct and natural method, and that every serious deviation from it results in a sacrifice of beauty of tone and premature ruin of the voice. For singing with Italian words or without any words at all (*solfeggio*) the Italian method is doubtless preferable to any other. But it is equally certain that for the execution of the dramatic and declamatory music of modern German composers—the songs of Schubert, Schumann, Franz, and the music-dramas of Wagner—a totally different vocal style is essential, which in itself is just as natural and as little injurious to the vocal chords as the Italian style. Frau Materna will show by her interpretation of the Wagnerian selections that have been made for the May-Festival concerts that Wagner's latest vocal style does not consist of a series of jarring, broken intervals, but is flowing, melodious, and highly impressive because it is simply an artistic elaboration of the natural emotional cadences of the human voice in speech.

Opinions, of course, will always differ to some extent as to which of these two styles or schools is the more attractive—whether Mme. Patti or Frau Materna is the high-priest of the true religion. Roughly speaking, musicians have for centuries been divided into two great parties, the lovers of the lyric and the lovers of the dramatic style. To the former a naked melody, with the merest shadow of an harmonic accompaniment, and no special regard for the meaning of the words to which it is set, is the highest type of musical beauty. The other party insists that the melody should only be one (not too tyrannically prominent) part of a complicated harmonic structure, because only harmony, when united with melody, can give full and definite expression to our emotions by means of the alternation of major and minor moods, concords and discords, modulations, and gay or sombre instrumental colors. Of course these remarks refer particularly to operatic music. On the concert stage, or in the drawing-room, lyric music has its proper place, but on the operatic stage it is as inappropriate as lyric poetry is on the dramatic stage. The question why nevertheless lyric melody has so long kept its place on the stage is easy to answer. Beginners in musical education first learn to appreciate melody (or tune) because it is easy to follow, and only later do they begin to understand harmony. In its highest development harmony is simply a *bundle of melodies*, so that in listening to it we may hear three or four melodies at the same time instead of merely one. To unravel these requires a mental effort, and this the fashionable habitués of opera are generally unwilling to make. As a German critic correctly observes, the exclusive devotion of the Italians to solo melody is largely due to their southern mental indolence.

But the Italians themselves have at last become tired of their simple lyric operas, and are importing harmonic, dramatic, and orchestral treasures from Germany by wholesale, as witness Verdi's "Aïda," Boito's "Mefistofele," and the Liszt cultus at Rome. Lyric operas in abundance are still produced in Italy every year by minor composers, but they invariably result in a fiasco. Those who admire the florid singing in which Mme. Patti excels must, therefore, admit that the outlook for their cause is not bright, since the leading Italian composers themselves have ceased to write the old-fashioned ornamental arias, while in other countries the florid style has long since been abandoned and Italian opera become comparatively neglected. At Dresden, for instance, only one Italian opera was sung during the whole month of February. Vienna had a brief season of Italian opera last year, but it did not prove sufficiently remunerative to be repeated this year. At Berlin, an Italian company appeared this winter which was praised by all the critics, but was soon obliged to leave for want of support. In Paris, Meyerbeer and a few French composers occupy the stage; in London, doubts have been expressed whether even a consolidation of the present companies and the presence of several leading *prime donne* would improve the financial situation of the managers; and even in America, where crowds go to see a great vocalist for the same reason that they go to see Jumbo or Oscar Wilde, lyric opera is not a paying business. In a word, Italian opera is dead, and it is time to look about us for a substitute.

It is from this point of view that we have applied the word "prophetic" to the arrival of Frau Materna so soon after the departure of Mme. Patti. In England, where all the critics, liberal and conservative, have already united their voices in a dirge on Italian opera, Carl Rosa has been successful with English opera or German opera in English, and there can be little doubt of a successful issue of the several series of modern German operatic performances which are to be given in London this spring. It is to be hoped, therefore, that New York will in this thing, as in so many others, follow the lead of London, and that an epoch of true art and good music will follow that of virtuosity on our stage. Our terms are carefully chosen. The difference between lyric opera and dramatic opera is precisely the difference between virtuosity and art. The arias of Donizetti, Bellini, and Rossini are, with some admirable exceptions, merely written with the view of giving a singer an opportunity of displaying his or her perfection of vocal technique. They are unhealthy and rank hothouse flowers, reared for the luxurious indulgence of fashionable society, whereas the melodies of Mozart, Gluck, Weber, Wagner, Rubinstein, and, we may add, Verdi and the best of the French composers, have their root in the healthy soil in which the songs and dance-rhythms of the people and the old Italian church music grew.

Nothing could be more amusing, therefore, than the charge of narrow-mindedness and prejudice which is often brought forward against the admirers of the "advanced school." A man can be a perfectly fair and liberal critic and yet refuse to admire that which constantly violates all the laws of æsthetic propriety, as Italian lyric opera does. In fact, it is the duty of a conscientious critic to oppose such an æsthetic monstrosity, to point out to the public that complacent enjoyment of such a nondescript is evidence of an uncultivated taste, and that an artist who is great only in such a sphere is not an artist of the highest rank. This is the case with Mme. Patti. Her repertory, which once embraced over thirty operas, included only one classic opera ("Don Giovanni"), and in that she did not appear to advantage. Even a semi-classic opera like Gounod's "Faust" is beyond her sphere. She is always Mme. Patti, and never succeeds in throwing herself into her part so completely as to identify herself with it. She always compels you to notice the sensuous beauty of her naked voice, and all other considerations regarding the opera must disappear before the tyrannic glory and technical perfection of that voice. This is virtuosity, not art; for art is not selfish. The greater artist is she whose individuality disappears in the work; and this is the case with Materna. Her voice is of great compass, sonorous quality, absolute purity, great flexibility, unequalled power, amazing endurance, and great emotional range and intensity. She could not sing the florid music of Patti any more than Patti could sing her dramatic parts, for the dramatic and lyric styles are never combined in the same person, being mutually exclusive. But she will do what Patti cannot do—make the audience feel that they hear, not Materna, but *Brünnhilde* or *Ortrud* themselves; and this is the perfection of art. In her own sphere Patti is as good as Materna; but that sphere is not so high as Materna's, and therefore Materna is the greater artist of the two. But in justice to Patti, it must be added that she is above most virtuosos of her class in so far as she avoids all display which is not prescribed in her part, such as abnormally sustained high and low notes, interminable trills, arbitrary tempo, and explosive final notes.

THE PROBLEM OF EUROPEAN CONTROL IN EGYPT.

Alexandria, March 29, 1882.

Alexandria during the last week or two has been in a rather abnormal condition of activity—that is, of the sort of superficial activity of which, in the absence of some casual outburst of

antipathy between Jews and Greeks, it is alone capable. The two sons of the Prince of Wales have been visiting Cairo and Upper Egypt, and the ship *Bacchante*, to which they are attached, has been in the Alexandrian harbor, together with its companion ship, the *Iris*. On their passing through the town here on Friday last, the 24th, the Princes gave the prizes at the Athletic Sports.

The state of politics in Egypt is just now so uncertain from day to day, and rumors of the most extreme contingencies succeed one another so rapidly, that the presence of British men-of-war in the harbor is regarded with more than usual complacency. It seems quite an open question with everybody whether there is anything which, with decent regard for truth, can be called a National Party ; and whether, even if there is such a party, the influence of the Army, and especially of Arabi Bey, is not so predominant as to render all mere political influences of insignificant account. I have already, in former letters, had occasion to describe the main streams of influence which are held to be operating here. The issue is, however, gradually narrowing itself to the question whether the Assembly of Notables can and will control the Army, and so prove itself to be a genuine constitutional factor, or whether a military despotism, under whatever specious form, will not carry all before it. The battle has been fought once over the question of the existence of Sherif Pasha's Ministry, which may be said on the whole to have supported in critical moments the cause of true constitutional reform, as opposed to military ascendancy. The battle was lost for the Constitution and gained for the soldiers. The new Government is in every sense a Government of war : the Prime Minister is the late Minister of War ; the new Minister of War is the potent Arabi Bey himself ; and the first principles of the new programme are that "the Budget," which here means the application of the resources of the state to the increase and better pay of the Army, shall be in the hands of the puppets of the Army, that is, the seventy-five members of the Chamber of Notables. As things are at present, the new Constitution excludes from discussion in the Chamber the European debt and all existing international obligations. But this clause in the Constitution, I am told, through the highest European authorities in Cairo, is so unpopular in military quarters that it may not long hold its place.

But even if a new Egyptian Government, or any future Government, hesitates to innovate in a manner which would call forth instant European intervention, the new Budget clause is sufficient of itself to imperil the most salutary of existing Egyptian institutions. The Budget clause has the effect of committing the preparation of the year's financial scheme to a commission formed partly from members of the Chamber and partly from the Ministry of the day. To an American or European eye this seems a very moderate and innocent proposal, and in fact it falls infinitely short of the amount of popular control over the national finances which is enjoyed in every country with a show of constitutional government. The real purport of the change can only be understood by recurring to the facts of Egyptian history during the last eight years. It was by nothing else than by European intervention that first in 1876 and then in 1879 the deplorable condition of Egyptian finance and Egyptian administration in all its departments even began to be relieved. In the course of applying this relief it was found that the national indebtedness, amounting to ninety millions of pounds sterling, was inextricably intertwined with the oppression and inhuman treatment of the population. The same Commission of Inquiry, appointed in 1878, representing all the leading European states, after exploring the innumerable defects in Egyptian finance, as brought about by the reckless prodigality of Ismaïl Pasha, dwelt in their report on the crushing methods of collecting taxes, on the iniquitous system of forced labor, which, as then exercised, was only another name for slavery, and on the hardships resulting from the prevailing mode of military conscription. They summed up the whole by reporting that no efficient remedy could be found for every one of these evils in the aggregate without putting a stop once for all to the irresponsible absolutism of the Khedive. This was the first and essential step, and, indeed, in all countries, this step is the indispensable condition for the establishment of anything like constitutional government. It happens usually that the restriction of monarchical absolutism grows out of the simultaneous and progressive advance of popular institutions. In Egypt, however, there were no materials—and, indeed, are not now—for true representative institutions. The only semblance of such is the Chamber of Notables, a body which was occasionally assembled by Ismaïl himself in his worst days for the purpose of obtaining the personal acquiescence of its members in taxation which mainly affected themselves. They were and are chosen from pashas and rich landed proprietors, usually nominated by Government agents, and with only an outside pretence of electoral forms. In the deeply depressed state of popular knowledge and information, nothing more is at present possible.

The result was that if financial reform meant administrative revolution, and neither the one nor the other could advance a step without Ismaïl's irresponsible despotism being put an end to, some yet untried force must be applied from without. This force has been found hitherto in a series of special institutions in the creation and support of which the English and French Governments have closely coöperated. Such institutions are the European commissions for the management of the public lands or Daïra estates, mortgaged for a certain portion of the national debt. Another institution is the Commission of Liquidation, which is mainly concerned with the more mechanical operations of collecting and receiving the revenue applicable to the payment of the debt, and handing it over to the authorized representatives of the creditors. The most important of these international constitutional checks is what is known as the Control, which, on the appointment of the present Khedive in place of his father in 1879, succeeded to the system of nominating an English and a French member of the Egyptian Ministry. The Controllers, as thus appointed by France and England, on behalf of all the Powers interested, had the right of attending the meetings of the Cabinet, of taking part in all discussions, of receiving formal notice of every administrative act, and of objecting on presumably financial grounds to any measure which might conceivably, in one way or another, affect the revenue. The result of such intermixture in the current administration necessarily was that the Controllers had often much to say on matters which only indirectly were of strictly financial concern. Indeed, of late the Italian organs in this town have made it their main charge against the Controllers, and especially against M. de Blignières, the French Controller, who has just resigned, that they gradually usurped political functions with which they had nothing to do. There is no doubt, too, that it has been found, especially last year, when Baron de Ring represented France as Consul-General, that there was an opening for conflict of views and action between the financial and diplomatic representatives of France or England. It has been fortunate, however, that M. de. Blignières and Sir Auckland Colvin, the English Controller, themselves have not only worked together with conspicuous harmony, but, in concert with Sir Edward Malet, have reduced these hypothetical difficulties to an almost microscopic point. It was said at first that M. de Blignières's successor was to submit himself in all respects to the French Consul-General. This announcement was looked upon with rejoicing here by the European opponents of France and England, as likely to reduce the influence of the French Controller to a cipher and to be the beginning of the end of the Control altogether. But it seems that there was a mistake about this, and that all that was meant was that the new Controller was directed generally to coöperate harmoniously with the diplomatic representative of France. Indeed, it has been properly noticed that it would have been an anomaly for the Controller, who is a paid Egyptian official and servant of the Khedive, to be subject at every moment to a diplomatic agent who represents nothing but his own country.

The real justification of the apparent encroachment of the Controllers on the domain of politics proper is found in the report of the Commission of Inquiry above alluded to. In Egypt more than any other country, except perhaps other parts of the Ottoman Empire, good government and good finance are indissolubly welded together—the usual form of combination, however, being the less happy union of bad government and bad finance. The pressing question now is whether, in a spurious aspiration for that which is as yet impossible, the only chance of the final reconstitution of Egypt shall be abandoned, and all the work of the last four or five years be undone, through the treasonable conspiracy of military adventurers making a disloyal use of the honored title "Nationality"; or whether the influence of Europe will be found strong and wise enough to check what may perhaps prove only a political eccentricity without subjecting the country to foreign domination of the sternest kind. A.

Notes.

Mr. F. Gutekunst, Philadelphia, sends us an extraordinarily fine photographic likeness of the poet Longfellow, which we can but prefer to every other presentment of him in his latest aspect that we have seen. It is half life-size, and mounted on a stiff pasteboard panel, with a neat bevel of gilt.

The April *Portfolio* (J. W. Bouton) gives two specimens of the woodcut illustrations for a sumptuous edition of 'Evangeline' just published in England by Cassell & Co. The artist is Mr. F. Dicksee, and the scale of some of his designs requires a full page of the *Portfolio*.

The forthcoming new edition of Mr. T. W. Higginson's 'Young Folks' History of the United States,' now in press, will have an additional chapter, bringing it down to the accession of President Arthur. The proposed uniform edition of the same author's writings will include a revised edition of his 'Epictetus,' which has for ten years been out of print and hard to get.

Houghton, Mifflin & Co.'s announcements embrace Mr. George P. Lathrop's new novel, 'An Echo of Passion' ; the first English translation of Heine's 'Philosophy and Religion in Germany' ; 'Notable Thoughts about Women,' by M. M. Ballou ; a new work on the Gypsies, by Charles G. Leland ; Mr. Henry James, jr.'s 'Roderick Hudson,' with the author's revision ; and new editions of Parton's 'Life of Horace Greeley'

and 'General Butler at New Orleans,' uniform with his 'Life of Voltaire.'

From the same firm we have the prospectus and specimen pages of Professor Francis J. Child's 'English and Scottish Popular Ballads,' already announced by us as begun to be put to press. This work will bring together for the first time something like the complete body of ballads of the countries named in the title, with absolute integrity of text, and with such a collation of independent versions as has never before been undertaken on so large a scale. "Each ballad will have a proper preface, and in the case of those ballads which the English have in common with other nations, an account will be given of related traditions. The work will have a general introduction, full indexes, and a careful glossary." It will be issued by subscription, in eight parts, at five dollars each; and only a thousand copies of this *édition de luxe* will be printed. Professor Child's qualifications for this infinitely laborious and scholarly task it would be superfluous to descant upon. His purpose, steadfastly adhered to for a quarter of a century, at last bears fruit which will do honor to American literature.

Henry Holt & Co. publish immediately 'On Horseback, in the School, and on the Road,' a reprint in one volume of the London editions of Mr. Edward L. Anderson's 'How to Ride' and 'System of School-training for Horses.'

The concluding volume of the coöperative work, 'The Public Service of the State of New York during the Administration of Alonzo B. Cornell,' edited by Dr. Paul B. Chadbourne, and published by J. R. Osgood & Co., with a wealth of heliotype illustration, is nearly ready to appear. In intention this unique composition is what might be called an instantaneous photograph of the machinery of a State government. It is both historical for the grand features, and biographical as regards the personnel of the present administration.

The first volume of the *Century* magazine rejoices in a truly splendid cover of black and old gold, with a decoration outside and in, derived from Mr. Vedder's monthly series of designs, but glorified by Mr. G. F. Babb's decorative genius. It is needless to rehearse the contents of the six months (November, 1881—April, 1882). Of all the portraits—and these include George Eliot, Matthew Arnold, Fortuny, Garfield, etc.—that of Thiers seems to us the most masterful and most memorable.

Mr. Robert Browning's admirers in this country should not rest easy until they procure the 'Bibliography of Robert Browning,' edited by Mr. F. J. Furnivall for the new Browning Society (Trübner & Co.). It opens with a reprint of Browning's introductory essay on Shelley prefixed to Moxon's edition of spurious letters attributed to that poet (1852), and then contains a copious bibliography, with endless footnotes, and an appendix impulsively got together as a guide to the various 'Selections' from Browning's poems, his changes in certain of them, and the critical notices which have appeared from 1833 to date. The "trial list" of these last is defective in American references, in spite of several postscripts. Mr. Furnivall's personality and the characteristics of English hero-worshippers make this volume amusing as well as valuable. The second edition is before us.

A late if not the latest addition to Bohn's Standard Library (London: George Bell & Sons) is the happy thought entitled 'Classic Tales,' and comprising "Rasselas," "The Vicar of Wakefield," "Gulliver's Travels," and the "Sentimental Journey." This reprint, besides the merit of being between a single pair of covers, also possesses that of adherence to the best editions—in general the earliest corrected ones; and it is not expurgated. The print of these 666 pages is surprisingly large and clear. It could be wished that other volumes might illustrate still further the wonderful variety and richness of English eighteenth-century fiction.

The notable increase in the employment of etching as a mode of illustration, in recent years, prepares one for the innovation in the engraved series of portraits which have been a distinguishing feature of the *New England Historical and Genealogical Register*. The April number contains an etched portrait of the late Samuel Osgood, of this city, with the usual biographical sketch. Lovers of puzzles will find in the same number a test of their acuteness in deciphering a seventeenth-century signature, the name of one of the elder Winthrop's correspondents, and from his endorsement probably Ashby or Ashley, while Colonel Chester and several English experts make it Slainey, Slayney, or Slaney.

Parts 29 and 30 of 'Stieler's Hand-Atlas' (B. Westermann & Co.) gather up those parts of the earth which offer the greatest difficulty to cartography, either, as in the case of South America, from a lack of authentic surveys, or, as in the case of Africa, from the incessant additions to our knowledge in consequence of explorations. In both these continents, moreover, disturbances of boundaries by wars have taken place since the last edition. Africa is presented in two maps on the same scale (1:12,500,000), one showing the northeastern portion, together with Arabia; the other, the entire extent south of the equator. Of South America we have Brazil from Bahia to the Uruguay border, and so much of the western coast as embraces all of Peru and Bolivia, and about half of Chili and the Argentine Confederation. In conformity with recent events, Bolivia is shut out from the sea; but Peru retains while yet she may the province of Tarapaca. Several South American ports are delineated in the ocean space of sheet No. 95. The southern sheet of Africa exhibits in a surprising manner the growth of settlement in the land of Livingstone. The two remaining instalments of this atlas are being pushed forward as rapidly as possible.

F. W. Christern has recently received a specimen number of the latest French theatrical serial. It is an intermittent illustrated publication called 'Les Premières Illustrées,' and is to appear shortly after the first performance of every successful play. There are eight pages of text adorned with neat little drawings of the principal scenes and actors, and there is an inserted portrait in heliogravure. The sketches are furnished by M. Paul Destez and the letterpress by M. Raoul Toché. The first number is devoted to "Lili," a three-act vaudeville, in which Mme. Judic plays the chief parts—appearing in the final scenes as her own granddaughter. There is an illustrated cover on which one may recognize the faces of MM. Dumas, Sardou, Sarcey, and J. L. Gérôme.

—The nineteenth volume of Frederick Martin's annual 'Statesman's Year-Book,' for 1882, comes to us from Macmillan & Co. Its title should not cause its general usefulness to be misapprehended. Journalists know the worth of it to them, and every writer or speaker on matters political or politico-economical should have occasion to refer to it. It would be a capital preliminary study for visiting statesmen, say like Mr. Voorhees, before going abroad. Per contra, we find it defective as a guide to Englishmen desiring to come to this country, especially as settlers. In regard to the public lands of the United States, something is said of the mode of survey, of school lands, land offices, land titles, and of land sales, but not a syllable concerning *homestead* lands; yet the sales of public land have long been a bagatelle compared to the amount "homesteaded." During five years ending with 1879 the homestead acreage was 23,000,000, and that sold was but little over 3,500,000. In the year ending June, 1879, the acres sold were 622,573; those taken up either as homesteads or by timber culture (which is a sort of homestead variation) were 8,026,684 acres—thirteenfold more. The silence of the 'Year-Book' in relation to homesteads is the more noticeable because all the facts about them are to be found in books of reference which appear on its own list. If Mr. Martin were a German official, his ignoring half a million American homesteaders would be thought to betray a desire to discourage emigration. As things are, he might excuse himself by telling us that the word "homesteader" is wanting in both Webster and Worcester (though "home-ruler" is found in the latter); and that neither of those lexicographers gives any place to that meaning of the word "homestead" which is predominant in more than half of the United States, and is a genuine and very creditable Americanism.

—Trübner & Co., London, send us the second edition of their important 'Catalogue of Dictionaries and Grammars of the Principal Languages and Dialects of the World.' The original edition appeared ten years ago; the present contains about three times as many titles and pages, and has an index filling more than four octavo pages in triple column, and referring to nearly 3,000 works. The publishers' aim has been to enumerate "approved grammars and dictionaries *that can be obtained without difficulty*," and, in fact, the larger part of these can be found in the stock of the Messrs. Trübner, and procured for the prices affixed. In certain aspects it may be regarded rather as a bookseller's catalogue than as a bibliography, as when we see only the third edition (1859; by error called the second, in the Catalogue) of Bartlett's 'Dictionary of Americanisms' recorded. Here the consulter misses the information that a fourth edition appeared in 1878, and of course can be obtained with even less difficulty. The omission of Prof. Schele de Vere's 'Americanisms,' though the work is not out of print, might be accounted for on the ground that it was not "approved" by the compiler. But we imagine that this epithet is somewhat loosely applied, and it were much to be desired that in a reissue of this catalogue its great and obvious utility to scholars should be enhanced by some indication, however brief, of the relative value of the works named in it. As it is, there is no other criterion except the date and the price. Apropos of dates, it seems odd that two of the late Dr. John Pickering's respectable contributions to American philology, both now out of print, should still be obtainable without difficulty—namely, his 'Vocabulary of Words and Phrases peculiar to the United States' (edition of 1816), and his 'Remarks on the Indian Languages of North America' (1836), in a Leipzig translation—assigned by the editor, by the way, to 1834. The most unaccountable omission that we have observed is that of Worcester under English Dictionaries. Neither is any American English grammar recognized. Otherwise, thanks in some degree to the various Indian dialects, American lexicography cuts as much of a figure as could be expected. Grammar and dictionary together, the range is from Gibbs's 'Chinook Jargon' to Leland's 'English Gypsies and their Language'; or from Haldeman's (not double *n*, as on p. 116) 'Pennsylvania Dutch,' and Zeisberger's 'Language of the Lenni-Lenape,' to Whitney's 'Sanskrit Grammar'; or again, from Matthews's Hidatsa Grammar and Dictionary to March's Anglo-Saxon Grammar, and Cor-

son's 'Handbook,' and Van Name's 'Contributions to Creole Grammar.' Moreover, we suspect that some of the Hawaiian vocabularies and grammars are of American origin.

—In answering Mme. Ragozin's Russian view of the Jewish question, Miss Lazarus, in the May *Century*, seems to have been embarrassed by the very absurdity of her opponent's theory. Her reply, though dwelling on the obvious weaknesses of Mme. Ragozin's representations, is hardly skilful in depriving them of the weight which lies primarily, if not wholly, in their cleverness. Besides this, it would certainly be more profitable to have the debate between two Russians whose acquaintance with the facts was not at second hand. The first instalment of Carlyle's "Reminiscences of my Irish Journey"—drawn up after his return, in October, 1849, from his letters to his wife and other memoranda—is dreary reading: jerky and fragmentary as usual, and characteristic of the British grumbling tourist. His sea-voyage was improved in making caricatures of his fellow-passengers—"and were I a painter, I could draw them," he says. Some portions sound almost like a travesty on Alfred Jingle. Mr. Grant White's "Opera in New York" comes down to Mme. Sontag, and consequently to the year 1854. No one who had the good fortune to see her, will dispute this writer's dictum that "in person she was . . . probably the most lady-like prima donna that ever trod the stage"; nor is the distinction a small one. Mr. Stedman adds one more study of contemporary poets to his growing list, taking Mr. Lowell for his subject, and treating him with the same frankness and tact which have marked the previous essays. We should, for its penetrating judgments, attach more value and importance to the "Fable for Critics" than Mr. Stedman does, but in other respects we have found little ground of difference with him. Mr. Lowell's prose is praised heartily, as it deserves. A little poem, "Estrangement," in three stanzas, and a masterly engraving by Kruell from an exceptionally good portrait, speak for themselves of the absent Minister. The poem needs to be read slowly to take in its elaborate imagery, and we can but think that a faulty punctuation has needlessly obscured the sense of the last stanza.

—The annual stated session of the National Academy of Sciences was held in Washington, commencing on Tuesday, the 18th, and ending on Friday, the 21st, of April. The public meetings took place in the lecture hall of the new National Museum building, the business meetings in an adjoining room. The session opened with the President's, Professor W. B. Rogers, annual address, consisting chiefly of biographical notices of a number of deceased American scientists; after which the regular programme for the day was taken up, papers being read by Messrs. Agassiz, Hunt, Cope, Scudder, and Gill. In business meeting on Wednesday, Mr. Silliman presented, on behalf of a committee, a report on the cultivation of sorghum in this country, highly favorable to the present and future of that industry; and during the public sitting of the same day papers were read by Messrs. Rowland, Draper, Mendenhall, Gibbs, Barker, Scudder, and Riley. In private session during the afternoon of Wednesday the Academy proceeded to the election of new members. Although the membership was only ninety-five, there being thus room for five more without reference to the four-fifths rule, only one person—Professor Ira Remsen, of Johns Hopkins University—received the number of votes requisite to election. An amendment to the constitution was adopted, providing that a candidate for membership to the Academy must be a citizen of the United States. On Thursday and Friday the programme of papers to be read was continued by Messrs. Scudder, Cushing, Wright, Barker, Cope, Peirce, and Langley. The attendance of members was not large, probably not one-third of the Academy being present. Among the social features of the meeting were the reception tendered by the Secretary of the Smithsonian Institution, to which the Philosophical, Biological, and Anthropological Societies of Washington were invited to meet the Academy; the reception by the President of the Academy to the members and their families, and the similar one by President Arthur.

—The matter of tests of structural materials, to be made under the direction of the general Government, is acquiring a new interest among engineers and others interested in metallic constructions. In 1875 an act was passed by Congress providing for the appointment of a board to test iron and steel, and appropriating $75,000 for this purpose. Under the charge of this board, a testing machine of a power and accuracy unrivalled by any other machine in the world was constructed, and is now in use at the arsenal at Watertown, Mass. The board, however, has gone out of existence, and the machine is used principally for such tests as private parties desire to have made at their own expense. During the recent meeting of the American Institute of Mining Engineers held in Washington in February last, a special session was devoted to the discussion of iron and steel as structural materials, and the opinion was generally expressed that a new act ought to be passed authorizing the President to appoint a new commission to take up the unfinished work which the old commission laid down, and thus to secure to the engineering profession of the country at large the valuable knowledge which this testing machine can give. The American Society of Civil Engineers has also passed resolutions relating to this subject, and it is expected that further action will be taken at the annual convention of this society, which is to be held in Washington next May. A more important course of investigation, or one more entirely free from anything like official mismanagement, can hardly be found.

—A very curious coalition is taking place in England. Every one knows how shabbily (in their own opinion) the Spiritualists have been treated by the scientific world. Generally men of science have been scornful, and have refused altogether to investigate. When they did investigate, they have cruelly remained unconvinced, with the exception of Prof. Crookes and a few others. It was to be expected, therefore, that when the Anti-Vivisectionists arose to torment the biologists and physiologists, the Spiritualists would lend them a helping hand; and that is what has happened. Mrs. Algernon Kingsford, M.D., has been allowed to deliver her lecture on "Violationism; or, Sorcery in Science," at a regular meeting of the British National Association of Spiritualists. One wonders whether the allies are united only by a common enmity or by that curious bond of sympathy among the isms which has been noticed in this country, and which makes it probable that any person who is (shall we say?) afflicted with one is, or has been, or is to be, addicted to half a dozen others. Things, however, now are not so simple as they were. Formerly there was the man of common-sense, or the man of science, as the case might be, on the one side, and the lover of isms on the other; and the two bodies were perfectly distinct. That of course could not last, for the progress of civilization, we have been told, is the evolution of the complex. At present there is considerable cross-classification. A number of scientists, for example, think that spiritualism is entitled to "respectful consideration"; at the same time they see the necessity of vivisection; so that their organ, the *Journal of Science*, "profoundly regrets" a step that is hostile as much to the biologists friendly to spiritualism as to those who regard it as jugglery and imposture. Probably the *Journal of Science* will have made its plea in vain. Revenge will be too sweet; and we shall see the whole body of Spiritualists joining the ranks of those who are determined that biology, physiology, and medical discovery shall continue to be a pursuit of knowledge under difficulties.

—The *Review of the Far East* (*Revue de l'Extrême Orient*, Paris: Ernest Leroux) starts on its first voyage richly freighted. Though conducted in French, it admits papers in English; and, as we presume, in other languages. It will contain original contributions, translations, and bibliographical notes and news illustrating the ethnology, languages, religion, art, and literature of Asia, especially that portion dominated by Chinese thought. The editor, M. Henri Cordier, has already made his mark by compiling the 'Bibliotheca Sinica,' a bibliographical dictionary of works relating to the Chinese Empire. Throughout, the *Review* bears the marks of skilful editing, notwithstanding the fact that the poorest matter is put at the front. Léon Metchnikoff, who is best known as the author of a catchpenny scrap-book descriptive of Japan, gives a thin paper on Japanese Sex Statistics. In a series, which promises to be very valuable, on the History of Chinese Studies, we find an excellent budget of notes to serve for the biography of the late Archimandrite Palladius, whose death left a gap not easily filled. Besides an outline of his life there is a good list of his published works. The editor furnishes a number of inedited documents illustrating the history of Christianity in China. Mr. Alexander Wylie, the accurate Sinologue whose removal from China sapped the vigor of the *Missionary Recorder* of Shanghae, contributes a translation into English of a Chinese work of the fifth century on the ethnography of China and the surrounding countries—an example which deserves to be imitated. An account of Cambodia follows. In the appendix are notes on manuscripts in European libraries descriptive of the Chinese Empire; a chapter on "The European Press in China"; the text of the treaty between Russia and China; reviews of recent books on countries of the Far East, and the bibliography of the year 1881 on subjects germane to the *Review*; and Notes and Queries. Altogether, the *Revue de l'Extrême Orient* is a valuable thesaurus for that half of the world which cares to know how the other and larger half lives. If we may judge from this number, the new venture is worthy of the hearty support of libraries and scholars in the United States.

—The spectacular sensationalism of Meyerbeer's "L'Africaine" helped that opera to such a great popular success at the "Academy of Music" that the addition to the repertory of another opera by the same composer followed as an inevitable consequence. "Robert le Diable" was produced on the 19th inst. with some of the best vocalists in Mr. Mapleson's company, and before an audience that completely filled the house. Many of the numbers were liberally applauded, and generally with more discrimination than is shown by the fashionable audiences that occupy the house during the regular season. The lion's share of the applause fell to Miss Emma Juch, who was repeatedly and deservedly recalled. She has not heretofore appeared to as great advantage in any rôle as in that of *Isabella*, the nearest approach to it having been her *Marguerite* in "Les Huguenots." As an actress, she still lacks experience, but her voice

has a clear, powerful ringing quality, which, added to its purity of intonation, made it a pleasure to listen to her execution of her difficult part. It is evident that Meyerbeer is Miss Juch's specialty, and not less so that he is not Mme. Minnie Hauk's. Like everything that this clever vocalist undertakes, her *Alice* showed careful study, intelligent conception, and conscientious execution, but lacked the spirit which pervades the work of a musical artist who feels herself in her proper sphere. "In 'Il Crociato' I still counted him among musicians; in 'Robert le Diable' I began to have my doubts; in 'Les Huguenots' I place him at once among Franconi's circus people." When Schumann wrote these well-known lines he was doubtless impelled by disgust at Meyerbeer's growing *Effecthascherei* in his later works, due to the extreme anxiety to tickle and please the popular ear. It would be more correct, perhaps, to say that the finest musical creation of Meyerbeer's is the duet in the fourth act of "Les Huguenots," but that "Robert" has a greater number of beautiful melodies, original harmonies and modulatory phrases, and refined instrumental coloring than any of his other works. With all its claptrap, there is much in this opera that, if well executed, interests even a refined musician.

STILLMAN'S HORSE IN MOTION.

The Horse in Motion, as shown by Instantaneous Photography. With a Study on Animal Mechanics. By J. D. B. Stillman, A.M., M.D. Executed and published under the auspices of Leland Stanford. Boston: J. R. Osgood & Co. 1882. 4to, pp. 127, plates cvii.

When Prof. Marey, of the Collège de France, was engaged in his experimental study of the flight of birds, he expressed his desire for the invention of a *fusil photographique*—that is, an instrument which, being pointed at a flying bird, could, on the pulling of a trigger, secure an instantaneous photograph of the moving object. The employment of instantaneous photography, thus suggested, for the study of animal locomotion has within the last five years become an accomplished fact. To Governor Leland Stanford, of California, belongs the credit of initiating this new method of scientific research, and of thus affording additional proof that a princely employment of wealth may be looked for in republics as well as in monarchies.

Of the inadequacy of the methods heretofore employed in the study of animal locomotion the voluminous literature of the subject affords convincing proof. We find, for instance, that almost every conceivable variety of opinion has been entertained in regard to the comparatively simple question of the order in which the feet of a galloping horse strike the ground. The unaided eye cannot appreciate slight differences in time with accuracy sufficient for the solution of this problem; and even when sight is aided by hearing (which, for this purpose, is a much more accurate sense), the results reached do not have that uniformity which might be expected. Thus, of two recent observers who have studied the gallop by attaching bells of different tones to the different feet of the moving horse, one concludes that the leading foot is the first, and the other that it is the last, to leave the ground as the animal rises into the air.

An accurate notation of the paces of the horse was first obtained by Prof. Marey, who published, some eight years ago, the results secured by the employment of the graphic method of registration. This method consisted in the transmission of pneumatic signals from elastic bulbs attached to the shoes of the horse through rubber tubes to a recording apparatus carried in the hand of the rider. The delicate apparatus employed in this research was not, of course, well adapted to registering the violent movements of a horse running at full speed, while it is in the study of precisely this pace that the method of instantaneous photography has led to the most brilliant results. The apparatus employed by Governor Stanford consisted of a battery of twenty-four cameras, arranged one foot apart at the side of a track along which the animal moved. By pressing against and breaking threads stretched across the track, the horse, in passing in front of each camera, closed an electric circuit and liberated the sliding shutter of the instrument. The plates were thus successively exposed at precisely the instant when the image of the animal was formed upon them. The intervals between the successive exposures varied with the speed of the animal, and the duration of each exposure was estimated by Mr. Muybridge, the photographer, at one five-thousandth of a second. The photographs thus obtained represent successive phases in the stride of walking, trotting, running, and leaping horses; while, for the sake of comparison, views of other animals—*e. g.*, the dog, the deer, etc.—are introduced. For the benefit of artists, a large number of views were taken by means of five cameras exposed simultaneously, and directed toward the moving animal from different points.

The heliotype process has been employed in reproducing these photographs, and the volume before us contains such a wealth of illustrations that it may best be described as an atlas of plates with an explanatory text. The literary portion of the work is from the pen of Dr. Stillman, of San Francisco, who has added to the value of the volume by introducing a number of colored lithographs illustrating the muscular anatomy of the horse, and serving to explain the exact mechanism of the movements revealed by the camera. An introductory chapter, in which the author, somewhat unnecessarily, takes occasion to express his disapproval of what he considers the atheistic tendencies of modern science, is followed by a discussion of the general and special anatomy of the horse. This extends over three chapters, in the course of which many special anatomical adaptations of the muscles and joints to the movements required of them are pointed out. The remainder of the work consists of a description of the various gaits, as analyzed by the camera.

The most striking and unexpected results have of course been obtained in the study of the fast gallop or run; for, in the case of the slower gaits, the eye is sufficiently well able to appreciate the successive phases of the movement. The motions of the running horse will be best understood if we consider, in the first place, some of the necessary conditions of quadrupedal locomotion. It is evident that a quadruped moving by successive leaps or bounds may use either the fore or the hind-legs to propel the body through the air. It is also clear that the pair of legs thus used for propulsion will, as the body rises into the air, be directed *backward*, and thus be in a position less favorable to receive the weight of the body when it again reaches the ground. The other pair of legs (*i.e.*, those not used for propulsion) will therefore be the ones on which the animal will naturally alight, and for this purpose they must of course be extended *forward*. From this it follows that when an animal leaves the ground from the hind-legs he will fly through the air with the limbs extended before and behind, and land upon the fore-legs; while if he employs the fore-legs to launch him into the air, he will appear in his flight with the limbs drawn well under the body, and will alight upon the hind-legs. This theoretical consideration is fully confirmed by the camera. The most perfect illustration of it is to be found on plates xviii. and xix., which represent the movements of the running hound. An examination of these figures shows that this animal moves, when at full speed, by a succession of bounds in which he leaves the ground twice in each stride. (The word stride is used by Dr. Stillman "to signify the distance passed over by one foot from the time it leaves the ground until it reaches it again.") In these two bounds the fore and hind-legs act alternately as the propelling power. In rising from the hind-legs, the animal flies through the air with limbs extended before and behind, and alights upon the fore-legs. Rebounding from the fore-legs, he is again launched through the air, but he now flies with the limbs drawn closely under the body, and on coming to the ground alights upon the hind-legs, from which he is again propelled upward to repeat the movement as described.

Now, there are obviously two ways in which a gait of this sort may be reduced to a single bound in each stride. Either the hind-legs may fail to react powerfully enough to lift the animal from the ground before the fore-legs are brought down, or the fore-legs may not propel the animal into the air before the hind-legs have reached the ground. In the first case, the run will be reduced to a single bound, in which the animal, springing from the fore-legs, flies through the air with the legs drawn under the body, and alights upon the hind-legs, while in the second case the run will also be reduced to a single bound, but the animal will now rise from the hind-legs, move through the air with limbs extended, and land upon the fore-legs. The camera shows conclusively that the first case is realized in the run of the horse, while the run of the deer affords an example of the second case. This difference between the running gaits of the horse and deer seems natural when we consider that a spring from the hind-legs is better adapted to carrying an animal over an obstacle, while a spring from the fore-legs serves better for attaining speed on level ground; and here it is interesting to notice that the horse, in leaping a hurdle, adopts for a moment the mode of locomotion of the deer. The necessity of slackening the pace in order to change the gait whenever an obstacle is to be passed, seems to explain why a horse that can outrun a deer on level ground is no match for him in the forest.

For the sake of simplicity, the run has thus far been described as if the two hind-feet, as well as the two fore-feet, acted simultaneously in propelling the body. It is evident, however, that, even when the motion is most rapid, the action of the two hind-feet is separated by a brief, and that of the fore-feet by a rather longer, interval of time. The movement of the running horse may, therefore, be thus described: The bound of the animal through the air is always made with the legs drawn under the body. On approaching the ground, one hind-leg is thrown as far forward as possible, and on this the whole weight of the body is received. Almost immediately afterward the other hind-foot is brought to the ground, to be followed after a short interval by the fore-foot diagonally opposite. Before this is effected, the hind-foot, on which the animal first landed, has been again lifted from the ground, so that for a time the weight is borne on a fore and hind-foot diagonally opposite to each other. Lastly, the other fore-foot is brought to the ground, and from this foot the animal is again launched into the air by the action of the powerful muscles which straighten the shoulder-joint. From this description, or, still better, from an examination of the plates, the inadequacy of the ordinary conception of the gallop is apparent. Worcester, for instance,

defines a gallop as a forward motion "by such leaps that the hind-legs rise before the fore-legs quite reach the ground." The camera has, however, as Dr. Stillman says, "been made to analyze all the paces, and none has been discovered that answers to this definition."

Many of the positions of the running horse, as revealed by the camera, are so unnatural and grotesque in their appearance that it is difficult to believe at first sight that the animal can really assume them. Particularly noticeable is the fact that the conventional position in which artists represent the running horse (viz., flying through the air with outstretched limbs) does not appear in any of the series of photographs; indeed, it is evident from the description of the run above given that it is a position which cannot possibly be assumed. On this text Dr. Stillman indulges in some rather severe criticism of artists generally, maintaining that the revelations of the camera must hereafter be their guides in depicting moving animals, and that pictures of running horses in the conventional position will "be relegated to the museums as examples of old masters, to illustrate the progressive stages in the development of art." He, however, admits, as an excuse for past errors on the part of artists, "that in the gallop the horse always moves his feet alternately, and to the same extent. At the limit of extension there is a change of direction given to them, and their image dwells longer upon the retina, and the impressions are more lasting than of the intermediate and more rapid movements, which the mind is unable to distinguish any more than the order in which they are made." Artists will probably regard this admission not only as an excuse, but as a justification of their course, and, continuing to draw the horse's legs in the position in which they are most distinctly visible, will persist in producing pictures which, though photographically incorrect, are artistically true. Inasmuch, however, as the eye always tends to see that which the mind knows to exist, and as optical illusions are less likely to deceive us when their true character has been discovered, it is very probable that the study of instantaneous photographs will gradually train the eye to recognize in the moving animal positions which the uneducated sense fails to detect. In this way a certain modification of our artistic conceptions may be produced, but the effect can hardly be so immediate or so revolutionary as Dr. Stillman seems to expect.

The mechanical execution of this work is entitled to great praise. The typography and the plates are excellent, but, owing to some strange carelessness, there is, in some cases, a want of correspondence between the letters on the plates and those referring to them in the text; and in one plate the letters are entirely omitted. This circumstance, together with an occasional obscurity of style, renders some of the descriptions of the muscles rather unintelligible to a reader not already possessed of some anatomical knowledge. Notwithstanding these defects, the work must be regarded as the most important recent contribution to our knowledge of animal mechanics; and it is to be hoped that the method, thus shown to be so effective in analyzing quadrupedal locomotion, will be applied to the study of the flight of birds and of the various movements of the human body. It is also very desirable that the method should be extended so as to secure a double series of views representing projections of the body upon two planes at right angles with each other; for in this way alone can the actual movements of the body in space be fully determined. The objection to the method is of course its expense, but, the first experiment having been so triumphantly successful, it is not too much to hope that other men of wealth may be found ready to follow the example so well set by Governor Stanford, of California.

RECENT ENGLISH POETRY.

THERE is just now in England, as in America, a tendency to the production of long poems. Of seven recent English volumes now before us, five are elaborate dramatic or narrative compositions, chiefly in blank verse. What is the fascination of this attempt? The man who never in his life arrested the attention of readers by a poem of ten lines feels yet secure of holding them through five hundred pages. "Sir," said somebody to Dr. Johnson, "when you have talked with my brother for an hour or two, you will find him a very pleasant companion." "Sir," said Dr. Johnson, composedly, "I can wait." Each of these long-range poets hopes to win his readers to a similar endurance, and thus prove to these patient waiters that they are no losers. The very extent of his work seems to increase the chance of some profit to the consumer. Charles Lamb reports that his friend George Dyer bought a tedious epic on the faith that there must be something good in a poem of eight thousand lines; and there are certainly instances to justify such wild expectations. Horne's 'Orion,' the once famous "farthing epic," vindicated this hope, for it afforded the one fresh line—

"'Tis always morning somewhere in the world."

Landor's 'Gebir' yielded out of its seven cantos the oft-quoted question,

"Is this the mighty ocean—is this all?"

Probably, if the truth were told, each bard feels that in the lottery of the muse he will win at least once. If he floats securely down to immortality, a single verse is spar enough to which to cling.

When we come to compare the recent long poems of English and American minor poets, we find that the English are more apt to be smooth and commonplace, while the American are more bold in theme and more original, not to say fantastic, in treatment. The mere fact that the American poems so often relate to one or the other of two very inscrutable subjects—theology and the American Indians—establishes at once a difference between them and their English compeers. The latter usually deal with historical or classical themes, and, as to treatment, they are further distinguished by being very seldom crazy, though they are often flat—which for critical purposes is worse. Perhaps it is that the academic English training still rules over these works; they often seem as smooth, as finished, and as monotonous as if they were so many lines of Greek or Latin poetry composed at Eton. With one exception, the poems before us are thus conventional in treatment; they are "content to dwell in decencies for ever," which, considering the fact that one of them is by Mr. Swinburne, may carry a sense of relief.

One is disposed to retract this last encomium, though, in view of a few pages of Swinburne's 'Mary Stuart: a Tragedy' (New York: R. Worthington)—pages in which the author turns his Scottish Queen into a foul-mouthed scold. But the prevailing fault of the poem is that, not merely in its allusions, but in its execution, it is utterly un-Swinburne-like. The exquisite beauty that marked 'Chastelard,' and that lent a charm to even its cloying descriptions and its quite unquestionable moral; those striking images, and those passionate thrills, and those delicious French and English songs that lay like pressed flowers among the pages—all these have disappeared and have left a monotonous masculine treatment, carrying with it a certain power, but no charm. It is evident that this poet, like certain painters, is to be recorded as having an earlier manner and a later manner; and it is to be hoped, for the sake of good morals, that his readers will never be tempted to wish him back in his unregenerate days.

Mr. Alfred Austin's 'Savonarola: a Tragedy' (London: Macmillan) is a good type of that genus of English poems which we began by describing. Mr. Austin is well known as a clever London journalist; the poem proves him a faithful student of history, and is worth to younger students half a dozen ordinary biographies of Savonarola. All the accessories, all the aspects of local coloring, are thoroughly brought in; one could pass a competitive examination upon the whole period after "getting up" this book only. Yet after all it is a text-book, and not a poem; the reader is never once thrilled or stirred or overjoyed. So far as the appeal to the imagination goes, a single page of 'Romola' outweighs it all. It may be very disadvantageously compared with 'Patrick Hamilton: a Tragedy of the Reformation in Scotland, 1528,' by T. P. Johnston (London and Edinburgh: Blackwood). The Scottish poet has greatly the best of it in freshness of theme; he has a hero of his own in Patrick Hamilton, the brave young pioneer of the Reformation in Scotland, whose name, as the preface tells us, stands first inscribed on the obelisk erected by St. Andrew's Bay, commemorating five brave men who there perished by fire for their faith. There is something really noble and touching in the development of Hamilton's character and fate in this little volume; and the book has that fresh flavor of external nature that is so often to be found in Scottish poetry. There are in it passages of great eloquence and profound feeling, such as the following, for instance:

"Sad, did death call us but to black despair—
To say farewell to earth, and sea, and sky,
And dear, familiar faces that we love;
No gleam of light beyond, nor any hope
Of a new heaven to come and a new earth.
Ye shining planets, that we ne'er should know
Our brothers in yon dwelling—never look
With nearer eyes upon the heart of things.
Still must I think that we shall know more yet,
And see more; that life moves to one great end—
Fulfilment, not frustration, is its goal." (P. 27.)

The little volume is adorned by one or two spirited etchings of Scottish and German scenes; and it closes with a short poem on "Columbus," which, although as good perhaps as Lowell's or Rogers's, is not good enough for its theme. The most striking subjects for art seem commonly to fail of eliciting art; perhaps because they discourage the artist.

'Dorothy: a Country Story in Elegiac Verse' (Boston: Roberts) is intended to be a departure from the recognized English type, and undoubtedly succeeds in being such. It is a protest against æstheticism so vehement that it almost makes æstheticism attractive; it seems almost better to walk down Piccadilly with a poppy or a lily than to devote two hundred pages of "elegiac" verse, and then a dozen pages of indignant prose, to prove that English girls who perform farm-labor have hands like rusty iron. The poem opens with such agreeable freshness, it seems to smack so well of the soil, that it is provoking to have it develop into such a mannerism. It is not pleasant to have one's kindly sympathies all subordinated to what English people would call a *fad*—a whim, namely, a crotchet of the author's mind. His Dorothy soon loses all her simplicity, for she is the exponent of a theory, and must hold up her rough hands obtrusively on every page. In America, where white women rarely do farm-work, and black women have that happy Ethiopian velvetiness of cuticle that saves their hands, even in the roughest labor, from the rusty-iron similitude, the poem loses most of its moral; and in spite of the occasional whiffs of fresh air in the book, we turn back with pleasure to the far more artistic

way in which Clough treated his Scottish peasant scenes in the 'Tober-na-Vuolich.' After all, to create a work of art, one must write without a hobby. The author of this poem is understood to be Mr. A. J. Munby, previously known by a pretty little poem called "Doris," where there is also a shepherdess, who is quite of the conventional description and has not the rough hands; unless perhaps the line—

"She touched my shoulder with fearful finger"—

be an amusing premonition of them.

A bit of rough-cast like 'Dorothy' is at any rate a good preparation for an essentially ideal work like 'Pygmalion,' by Thomas Woolner (London: Macmillan). The poet is undoubtedly the well-known sculptor of that name, who was associated with Rossetti in the early pre-Raphaelite movement, and now takes up the lyre just as his friend has laid it down. Here we have something of the Keats flavor, and which even fulfils in a degree the modest ideal after which Keats sighed, as appears by his early letters. "I have heard Hunt say, and may be asked, 'Why endeavor after a long poem?' To which I should answer: 'Do not the lovers of poetry like to have a little region to wander in, where they may pick and choose, . . . which may be food for a week's stroll in the summer?'" This is what 'Pygmalion' certainly offers, and an attractive little region it is, with no great heights or depths, to be sure, but with many bosky by-ways for the summer stroll. The treatment of the legend is not wholly new, for the solution is simply that Pygmalion weds his model; but this easy rendering is set about with so many statuesque maidens and heroic youths as to seem very Greek and satisfying. The author is best when he is most himself; but there is in the ninth book a strange slipping aside into Browningisms, such as—

"Roundness remarked it was not well to rail
Too boldly at the Best: scoffs might by chance
Bounce to their ears; they might think well to shift
Their purchases, and other purses fill;
A change too horrible! Let well alone!" (P. 132.)

This reads like an intentional parody; but the general tone of the book is even and sustained, though rising too much into a tone of realistic tragedy before the end. Its art-maxims are good, and even its political philosophy, as in lines like these (spoken by the hero to his friend, who is for suppressing all civil commotions in soldier fashion):

"But steel, O friend! will scarce suppress
A rising tide, or backward push the sun
Because, forsooth, his beams too fiercely burn!
Against the tide we must protect our shores
By driven piles, and stones in sloping walls,
And quays of solid strength. Then tides become
The servants of our greatness, bearing ships
Exultingly to conquest, or, in peace,
Enriching us by gathered merchandise.
We must not throw sharp sand against the wind.
No; we must strive to guide, not stay, this growth."
(P. 89.)

Of shorter poems, we should certainly mention those of Mr. Francis Bennoch, 'Poems, Lyrics, Songs, and Sonnets' (Boston: Houghton, Mifflin & Co.). This volume is the authorized American edition of the works of one better known as the faithful friend of Hawthorne than through any present or probable renown of his verses; and his preface is perhaps the most interesting part of the book. He gives here the history of his poetic life, from the time when, as he says:

"As the son of a Scottish farmer, it was my delight, if not my duty, to assist the shepherd and servants for a long night in a terrible storm, the object being to keep the sheep on the windward side of the fold, lest, if left on the leeward side for shelter, they should be smothered in the drift and lost."

This little bit of prose description is more graphic and speaks more to the imagination than any of the poems in this thick volume; and it reminds us, for the thousandth time, how often men's unconscious work is their best. Of Hawthorne Mr. Bennoch says, with pardonable self-consciousness: "My house was as his own home, and to me more than to any living man was disclosed the inner working of his marvellous genius." The book has a portrait of Mr. Bennoch, and the American edition is inscribed to the memory of Hawthorne and of Fields.

Mrs. Pfeiffer, author of 'Under the Aspens: Lyrical and Dramatic' (London: Kegan Paul, Trench & Co.), is not the lady who carried that name to all parts of the world as a traveller, thirty years ago; her portrait at the beginning of the book would make that charge an anachronism. But she has carried her literary wanderings into many domains, and has published five previous volumes, all duly advertised, in English fashion, at the end of this volume, with copious puffs from the newspapers, including some kind words from Longfellow, Lowell, and Holmes. Poets are so apt to be generous to their younger sisters of the lyre, that these compliments must not be too closely construed. All that we can honestly say is, that Mrs. Pfeiffer seems a worthy follower in the school of Mrs. Hemans and Mrs. Norton—with feelings as facile and verse as flowing as theirs, but with less of melody than the one and less of hearty human feeling than the other. In the quality of vigor, for some reason or other, our American "poetesses" seem just now to take the lead; nor do they all suffer, as Mrs. Pfeiffer suffers, from too easy a fluency of honeyed words. Their number, too, is steadily increasing and their work improving, whereas Jean Ingelow and Christina Rossetti seem to have no spiritual successors of like promise.

THE WAR ON THE PACIFIC.

Histoire de la Guerre du Pacifique. Par Diego Barras Arana. 2 vols. Paris: J. Dumaine. 1882.

THE book before us is, we believe, the only complete history yet published of the war between Chili and Peru. Several reports of a technical, naval character were made by the officers of the United States squadron on the South Pacific Coast concerning the naval actions of the war, and they were made public about two years since. Lieut. Mason, who was then serving in the same squadron, has also contributed two papers on the war to the *United Service Magazine*. With these exceptions, we believe, the only accounts that have hitherto been made public are those which have been given in the current news of the daily papers. Señor Arana's history is from the Chilian standpoint, and it was not to be expected that it should be free from national prejudice; but it is clearly written, is free from bombast, is accompanied with a great number of maps which are in every way admirable, and is worthy of careful study.

Even after making all due allowance for partiality, it is evident from this book that the Chilians have gained their great victory over the Peruvians because they were the superior people: superior in intelligence, in industry, and in political stability. In discussing at length the causes of the war and the relative conditions of Chili, Peru, and Bolivia, numerous citations are made from the works of German, French, and English travellers and consuls in support of this claim to superiority; but no one of them is so convincing as the bare fact that, while her rivals have had constant revolutions, in Chili there has been no revolution in the past fifty years. It is only a minority of the governments of the world that can say as much. In Chili there were but four Presidents from 1831 to 1871, each being reëlected for a second term of five years; from 1871 to 1881 there were two Presidents, reëlection being prohibited. Every one of these men succeeded to his office with an unquestioned title. Among the many causes which have contributed to Chilian sobriety and industry, probably none have been more potent than that mentioned by Mr. Rumbold, for many years British Minister Resident at Santiago—viz., "the almost complete absence of those accidental sources of wealth which Providence has lavished so abundantly on some of the neighboring states, and the consequent necessity of resorting to agricultural labor, which is quickly rewarded by a generous soil.' As one result of this difference between the habits of a mining and an agricultural community, we find that at the beginning of the war Peru had a debt of $213,000,000 ($78 per capita), while Chili owed but $50,000,000 ($25 per capita).

The war found its origin, as is well known, in a dispute concerning boundary lines, complicated and made prominent by the discovery of the valuable nitrates. When the South American republics achieved their independence, it was agreed that their boundaries should be the same as those which had existed when they were provinces of Spain. This principle of their public law was known as the *uti possidetis* of 1810, that being the last year in which Spain had exercised unquestioned jurisdiction. It was supposed that this principle would afford an easy settlement of all boundary questions, but in fact it led to endless disputes on account of the vagueness of definition of the provinces. One of these disputes was in regard to the boundary between Chili and Bolivia in the desert of Atacama. Chili claimed, and until 1842 it was not disputed, that her territory extended to the twenty-third parallel of latitude. The Chilians, however, having discovered not only copper mines, but guano and saltpetre in this desert, Bolivia claimed that Chilian territory extended no further than the twenty-fourth parallel. During the fourteen years prior to 1879 the dispute continued without intermission, and more than once reached the verge of war. It would appear that the Chilian capital already invested in the disputed territory made Chili reluctant to proceed to extremities in support of her claims. In 1866 she entered into a treaty recognizing the twenty-fourth parallel as the boundary, but stipulating that the territory between the twenty-third and twenty-fifth degrees should be a sort of joint property, the revenues of which should be divided between the two countries. No portion of this revenue was ever received by Chili. In 1874 another treaty was made, in which all the concessions were on the side of Chili, who renounced all claim to revenues due under the treaty of 1866 and all joint ownership of territory, on condition only that during the space of twenty-five years no increase should be made in export duties or other contributions levied on Chilian capital and subjects engaged in the desert of Atacama. In 1878 the Government of the day in Bolivia repudiated the acts and treaties of its predecessors, and levied a new export duty on the nitrates, and when the Chilian company demurred to paying it, the Bolivian Government ordered its property (valued at $6,000,000) to be sold at auction. On the day fixed for the sale (February 14, 1879) 500 Chilian soldiers landed at Antofagasta to prevent it, and war was begun.

In all these proceedings Peru had openly taken no part, although it was suspected that she was secretly advising Bolivia in her course. Peru had succeeded, by a series of decrees of a most oppressive nature, in confiscating the Chilian nitrate property within her own province of Tarapaca, but had committed no overt act of hostility. When the war broke out, however, between Chili and Bolivia, it was discovered that a secret treaty of offensive and defensive alliance had existed for nearly six years between Peru

and Bolivia. This treaty was avowed by Peru, whereupon Chili forthwith declared war, on April 6, 1879.

A war between two countries having each a seacoast of 1,500 miles and an impassable range of mountains distant but 100 miles from the coast, and separated from it by sandy deserts where even water must be carried by an army—such a war must necessarily be of a peculiar and exceptional character. The base of operations and the means of transportation must always be by the sea, and for this the command of the sea is an indispensable prerequisite. The operations of the Chilians showed a very clear conception of these conditions, and during the first six months of the war their efforts were confined to the organization of their army and to a struggle for the naval supremacy. The Peruvians had undoubtedly the stronger navy; it consisted of four ironclads, two wooden corvettes, and a dozen smaller vessels—the entire armament being sixty-six guns. The ironclads were a frigate (*Independencia*), mounting twenty-two guns; a turreted ram (*Huascar*), with five guns; and two American monitors. The Chilian navy contained two ironclads, two wooden corvettes, and six smaller vessels, the number of guns being forty-four. The ironclads were English-built frigates (*Blanco Encalada* and *Almirante Cochrane*), mounting six guns each. The fighting strength of Peru was therefore about double that of Chili. In the first six months of the war this relative strength was exactly reversed, in two decisive battles, besides the ordinary skirmishes incident to the blockade. In the first of these battles, which took place off Iquique on May 21, the Peruvians had their two principal ironclads, and the Chilians two wooden vessels of less than 1,000 tons each. One of these vessels was sunk, and the greater part of her crew destroyed by the Peruvians, but the other, while being pursued by the *Independencia*, ran over a rocky shoal on which the larger vessel struck, and was completely lost. The second battle occurred on October 8, near Cape Angamos. It was between the *Huascar* and the *Cochrane*, assisted at the close of the action by the *Blanco*. In this battle, which lasted an hour and a half, Admiral Grau, commanding the *Huascar*, and sixty men of his crew were killed, and his vessel was captured. The result of these two battles left the Peruvians with no ironclads except the two monitors, which could not be trusted at sea without convoys, and the Chilians with three powerful ironclads, which were soon placed in excellent order. The control of the sea being thus secured, the invasion of Peru was at once begun.

The allied army of Peru and Bolivia, numbering about 20,000 men, then occupied the southern provinces of Peru, the principal seaports of which are Iquique, Pisagua, and Arica. The Chilians determined to divide the allies by striking their line in the centre at Pisagua; and a force of about 10,000 men of the army organized at Antofagasta was carried in transports and effected a landing at Pisagua on November 2. Then they penetrated to the interior and fought a battle at Dolores, in which the allies were defeated, and the Bolivians dispersed into the mountains. A week later another battle was fought with the Peruvians at Tarapaca, in which neither side could claim a victory, but which was followed by the hasty retreat of the Peruvians to the north. The result of this short campaign, in which the Chilians lost about 1,000 men, was to place the entire province of Tarapaca in their hands. It was followed by revolutions in Peru and Bolivia, and the instalment of Pierola as Peruvian Dictator.

Early in the year 1880 a new campaign was projected. The allies had a force of about 10,000 men at Tacna, and it was determined to land an army on the north of them, so as to cut off all retreat to Peru and force a decisive battle. The Chilian army, numbering about 14,000 men, was reëmbarked, landed about sixty miles north of Tacna, and, after some preliminary skirmishes, marched across the desert against the allies. A very severe battle was fought at Tacna on May 26, in which the Chilians lost one-fourth, and the allies three-fourths, of their numbers. The Chilians then turned to the neighboring town of Arica, which they carried in open assault on June 7, the greater part of the defenders losing their lives.

The first two campaigns had therefore given Chili the undisputed possession of the entire seacoast as far as the eighteenth parallel; had permanently dispersed the Bolivians, and inflicted a loss of over 10,000 men on the Peruvians; had destroyed one, and captured two, of the enemy's vessels; and had blockaded his principal port of Callao. Nothing now remained but to attack the enemy's capital. This, however, required a reorganization and an increase of their army; and while this was in progress two important events took place. In September an expedition was fitted out, under Admiral Lynch, comprising 2,600 men, including cavalry and artillery; they were embarked on two transports, escorted by two vessels of war, and during eight weeks this force roved up and down the entire coast of Peru, landing here and there to levy contributions of over $150,000 in hard money, destroying a vast amount of property, and capturing from a Panama steamer $7,000,000 of paper money on its way to Peru, with which the Chilians afterward paid a large portion of their expenses. In October the neutral governments offered their good offices for peace, and a conference took place on board the United States flagship in the bay of Arica. The Chilians offered the same terms which they now propose—viz., the cession of Tarapaca and Atacama, the payment of an indemnity of $20,000,000, and the occupation of Tacna and Arica until the indemnity was paid. The terms were rejected, and the war went on.

The expedition against Lima was organized as promptly as possible, and in the latter part of December the Chilian army of 26,500 men was disembarked near that place. Two severe battles were fought at Chorillos and Miraflores, on January 13 and 15, 1881, in which the Peruvians were defeated and dispersed, with a loss of more than half their force. The Chilians entered Lima on January 18, Pierola taking refuge in the mountains, and a provisional government being formed under Calderon.

With these events Señor Arana's history ends. It shows plainly that Chili has fairly achieved her conquest by means of serious work against people whose chief reliance seems to have been upon proclamations and threats, and who have wasted their strength in internal commotions at a time when every effort was needed to repel a foreign enemy. What terms policy and prudence, as well as her own sacrifices, require Chili to dictate to her conquered foes, it is for her to determine. There was little of novelty or interest in the military operations: the distances and the difficulties of the country were great and the armies were small. The Peruvian army at Lima is described by Lieut. Mason as worse than "the worst militia division in the worst militia days in the most peaceable part of our country." The Chilian army was composed of better material, and was fairly organized and equipped, but doubtless was far below the standard of regular troops in Europe or of our own volunteers of 1863–65. It was almost wholly raised during the progress of the war. The naval operations were interesting as testing the powers of the smaller class of ironclads, but the character of the officers and men on both sides was not such as to warrant any conclusions applicable to the navies of more highly organized powers.

Familiar Allusions: A Handbook of Miscellaneous Information. Begun by William A. Wheeler. Completed and edited by Charles G. Wheeler. Boston: J. R. Osgood & Co. 1882.

Words, Facts, and Phrases: A Dictionary of Curious, Quaint, and Out-of-the-Way Matter. By Eliezer Edwards. Philadelphia: J. B. Lippincott & Co.

'Familiar Allusions,' of which the title has not been very happily chosen, though it might be hard to find a better, is the second posthumous work of the industrious author of the 'Dictionary of the Noted Names of Fiction.' His 'Who Wrote It?' had a very definite aim and scope. The present dictionary deals liberally with more or less famous places, streets, inns, churches, and other buildings, pictures, clubs, ships, trees, natural curiosities, etc., etc. A random selection will best show the range of it: Brook Farm, Charter Oak, Coliseum (Rome and Boston), Crepuscolo (Michael Angelo's statue), Ehrenbreitstein, Elgin Marbles, Five Points, Great Eastern, Great Peter (bell, at Exeter and York), Kremlin, Lear (West's), Leicester Square, Liber Studiorum, Mammoth Cave, Massachusetts Avenue (Washington), Mermaid Tavern, Merry Mount, Meta Sudans, Niagara (Church's), Père-la-Chaise, Piazzas (in great number), St. John Lateran and a very convenient lot of "Saints," Tarpeian Rock, Table Rock, Thames Embankment, Washington (a number of titles), and so forth. A large proportion of these have pertinent literary quotations appended to them.

As will be seen, the editor's intent to supply information which cannot be found in the common dictionary, or often in any dictionary, has been carried out within the limits which he more or less precisely set himself. It would be too much to expect entire consistency or perfect proportion. Telegraph Hill in San Francisco is unquestionably a much finer thing in nature than Murray Hill, New York; but as a "familiar allusion" (now, to be sure, in its decline) the latter outranks the former, and yet goes unnoticed, while room is found even for the Terrace in Central Park. Beacon Hill is recognized, and so is Beacon Street, but without any hint of the social significance of one-half the familiar allusions to this quarter of Boston. Hotels come within the editor's scheme, but the old, familiar Astor House is neglected; Delmonico's we find, but not Parker's. The Boston Somerset Club is not now so widely known or spoken of as its recent rival, St. Botolph's—a name which occurs in connection with the celebrated English church. Battles are sometimes in order—witness Cold Harbor and Five Forks. But where is Bull Run, to mention no others? Among the great streets of the world we miss, to match the Unter den Linden and the Max-Joseph-Platz, the Ring-Strasse of Vienna. An exception to the rule that names appropriate to the gazetteer, such as names of cities, are avoided, might have been made in favor of Canossa, for the sake of Bismarck's familiar allusion.

An unusual concession is made to consulters of this dictionary by such an alphabetical arrangement as Albert Dürer, Beatrice Cenci, Benjamin West, Death of Wolfe, Madame Tussaud (with cross-references from Dürer, Cenci, West, Wolfe, and Tussaud, respectively), Arsenal of Venice (no cross-reference), etc.; yet Bellini, Giovanni—not Giovanni Bellini. Running through the alphabet, we note also Alte Markt for Alt-Markt; Beatrice

Cenci—no allusion to the fact that the so-called portrait is neither by Guido nor, probably, of her (see the *Nation*, vol. xxx., 387); Bed of Justice — French *parlement* is mistranslated "parliament" in the modern sense (*cf.* Parliament House); Coppet "*now* belongs to Mme. de Staël's son-in-law, the Duc de Broglie," whereas this Broglie died in 1870, nor did Coppet ever belong to him; Élysée—no mention of its being the official residence of the Presidents of the Republic; Fernay (*sic*) "was built by Voltaire," but such was not the case; Hollenthal; Iron Crown—said to be still in Vienna; Jarvis Gallery; Kaiserstuhl — mistranslated "Cæsar's Seat"; Königgrätz-Strasse for Königgrätzer; Palais Bourbon—cross-reference to Palais du Corps Législatif, whereas the old name, which had been in disuse from 1852 to 1870, was restored in 1871; Palais Royal "is now used as a *royal* residence"; Parc aux Cerfs—innocently and literally described as "a park or preserve at Versailles, France"; Porta Westphalica—in "the mountain range called the Wiehen- [for Weser-] gebirge"; Quirinal, since 1870 the residence of the royal family, is called "the palace of the Pope"; Spielberg—"now a prison," but no longer so; Star and Garter—"an old tavern in Pall Mall," illustrated by a quotation from Thackeray having reference to the Star and Garter at Richmond; Tell's Chapel—with full credence in the Tell myth. As will have been remarked, many of these errors show that the late Mr. Wheeler's occupation or failing strength, or both, prevented him from giving any attention to this work after 1870—a fact which the present editor has not duly kept in mind. 'Familiar Allusions' is sufficiently trustworthy, however, to make it a decided acquisition among our minor books of reference, and may be easily improved in a second edition.

We shall not pay Mr. Edwards's dictionary the compliment of so minute an examination. It is in effect a scrap-book of notes and queries, and, indeed, under Newspapers in America, the entire article consists of a labelled extract from the London *Notes and Queries*. The province of Worcester and Webster is freely invaded—*e. g.*, Epilogue, Epithet, Optimist, etc.; not seldom Mr. Wheeler's lines are crossed—*e. g.*, Colosseum, Covent Garden, Seven Dials; Americanisms are recorded—*e. g.*, Sling and Smart Chance (it should be stated that this compilation is a foreign one)—and no discoverable principle of inclusion or exclusion is observed. Still, this work, too, would have its uses if it could reasonably be depended on, but authorities are rarely given, or are not of the best. In etymologies, particularly, Mr. Edwards is both weak and reckless. He denies that *couple* can be used of two objects not yoked or bound together; says, under Embowel, that disembowel means the same thing, "notwithstanding its negative prefix," as if *dis-* had only a negative function; makes *mammoth* "probably a corruption of Behemoth," when the most that can be said is that it comes to us by way of the Russian and Tatar; and follows an obsolete and palpably absurd explanation (Trench's) of the *mid-* in midwife. We cannot think it desirable that such medleys as this of 'Words, Facts, and Phrases,' even if better done, should be multiplied.

Opium-Smoking. By H. H. Kane, M.D. New York: Putnams. 1882. 18mo.

Opium-eating is an old and considerably-diffused habit in this country. Opium-smoking, on the other hand, is a novelty of very recent introduction; but the vice, or the accomplishment, is represented as rapidly spreading. The statistics upon this point are curiously definite. In the little book before us, the person is named who is reputed to have been the first American opium-smoker, "a sporting character named Clendennyn; this was in California, in 1868. The second, induced by the first, smoked in 1871. The practice spread rapidly until 1875, at which time the authorities, finding that many women and young girls, as also young men of respectable family, were induced to visit the dens, where they were ruined morally and otherwise, a city ordinance was passed forbidding the practice, under penalty of a heavy fine or imprisonment. Many arrests were made, and the punishment was prompt and thorough." The practice, however, spread eastward like an epidemic. In Virginia City, Nevada, it appeared among Americans in 1876, and was soon made a penitentiary offence. Had it not been for this heroic treatment, writes a local physician, "I am satisfied that the habit would have extended into the higher classes." Truckee, Carson, Reno, and other towns along the Pacific Railroad quickly fell into line. During the same year Americans in Chicago, St. Louis, and New Orleans began to smoke opium; and the first "opium-joint" or "smoking-den" for American customers was opened early in 1877.

It need not be said that the Chinese in our large cities have long had their opium-houses; Dr. Kane refers to what he calls a "carelessly-written and highly-colored description" of the Chinese dens in New York, published in *Scribner's Monthly* for July, 1880. "Joints" for the newly-developed American opium-smoker now exist not only in the Chinese quarter (Mott Street), but also in several up-town quarters. One of them, it seems, is kept by American women. This account of the spread of the practice is confirmed by the increasing importation of the drug in the particular form of smoking-opium. Of this (not a pound of which is used for medicine), 53,189 pounds were consumed in the United States in the fiscal year 1876, and 77,196 pounds in 1880, under a duty of $6 per pound; the values for the respective years being $577,288 and $773,796. As the Chinese population has remained nearly stationary since 1876, this increase is attributable to American smokers of opium. These are now estimated at 6,000 or more, and their average individual consumption at 100 grains per day.

This quantity seems enormous; but the fact is that to produce a given degree of narcotism the opium-smoker's dose must be several times greater than the opium-eater's. The contact of the narcotized smoke (when breathed into the lungs) with the absorbing pulmonary tissues is brief, and much of the narcotic principle is carried away with the expired smoke, while the "residual air" of the lungs forms an obstacle to the complete interpenetration of the tissues. Some 33 per cent. of the opium, again, is converted into an ash which is rich in morphia, six grains of it, administered hypodermically, being enough to paralyze a rabbit. The average consumption of the Chinese smoker is estimated by Sir Rutherford Alcock at one mace, or sixty grains, daily. The number of opium-smokers in China has been the subject of careful inquiry, but with greatly differing conclusions. It is probably from 3,000,000 to 6,000,000—one or two per cent., that is to say, of a population that exceeds 300,000,000. Inspector-General Hart, of Shanghai, says: "There is a deeply-rooted conviction in the Chinese mind that opium does unutterable harm to the country." There is a saying among the Chinese to this effect: "During the opium-war the English gave us balls of iron, and after the war balls of opium." In 1869, Bishop Shereshevsky was driven out of the capital of Honan province by a mob which shouted: "You burned our palace; you killed our Emperor; you sell poison to the people; and now you come to teach us virtue!"

Dr. Kane's summary of the effects of opium-smoking contrasts sharply in some points with the more familiar phenomena presented by the opium-eater and the victim of alcoholism. On the one hand, the opium-smoker suffers the most, both financially and morally: a great part of his time is spent at the "joint," where it seems a certain placid good-fellowship prevails; but his mind becomes lethargic, and both business and family cares are soon abandoned, while the cost of the large doses required is very considerable. No habit tends more surely to the destruction of female virtue, the drug acting, until tolerance of its effects is established, as an aphrodisiac. On the other hand, the opium-smoker is not so completely unfitted for work as the drunkard, and organic lesions rarely occur, though the constitutional disturbances are considerable; he is not violent, nor does he disgrace himself in public, and the opium-smoking habit can be cured with comparative painlessness and rapidity. The treatment consists in the use of capsicum, digitalis, and tincture of cannabis indica. Dr. Kane experimented upon himself at some length, having purchased a complete smoker's "lay out" or equipment, and his account of the etiology of opium-smoking, though brief, is an addition to our knowledge of the subject.

Money-Making for Ladies. By Ella Rodman Church. New York: Harper & Bros.

This book is not worth the handsome dress the publishers have given it. It is a silly little book, but unfortunately its power to do harm is in inverse proportion to its merit. It repeats the well-known catalogue of employments for women, and actually the only new suggestion in the list is the netting of silk hammocks for dolls. Such loose statements as the following prove its worthlessness as a practical guide: "Strawberries have been sold the first of April at five dollars a quart." This year they were plentiful at a dollar. "Copying for lawyers" is "very dirty, tiresome work, and poorly paid. Three cents for every hundred words is an exceptional rate, as it is oftener less." On the contrary, six cents is no more than the average, and eight cents is not an uncommon price for choice work. But the book goes from bad to worse, when advice is in question. "Within the last few years, when so many non-toilers have been compelled to consider more or less the subject of money-making, the discovery has been very generally made that literary work is the most agreeable and remunerative of the various occupations suitable for a lady." "Fiction is always a wide field for woman. It requires less time, less study, and less money." "So little outlay is required for literary work—pen, ink, and paper, and a few postage-stamps constituting the capital." In such nonsense are the seeds of unlimited mischief. It can only lead to wasted time, disappointed hope, and, at best or at worst, to gratified vanity in the dubious success of adding to the pile of trash from the cheap press.

Our gravest objection, however, is against the whole tone and motive of the book. There is not, there cannot be, any money-making for ladies in any distinctive sense. Work is work, of all kinds, of all people, and the laborer is worthy of his hire. Any good worker of high degree would scorn the presumption that her work differed from Bridget's because she herself was a *lady*. So illogical is much of the talk on this subject that the same breath that insists there shall be no difference between the work of men and women will blandly assert, as in this book, that such and such "is quite out of the question for a lady," or "teaching is one of the few

means of money-making in which a lady may openly engage without compromising her social standing." This brings us to the motive of the book—not an implied one, but most frankly stated. The distinction is not drawn between women and ladies, but between persons who devote themselves to a profession or trade thoroughly and perseveringly, and those who catch up anything which can be quickly learned and lightly used for the earning of money. The money—and here is the evil of the book—is wanted for finery and for pleasure. The introduction says: "What shall Isolte of the white hands do? Her case is undoubtedly hard—she is totally destitute of a new silk-dress, the means to purchase Christmas presents, and various other comforts and belongings of civilized life." Here is the beginning of "an account of actual experience to encourage the uninitiated": "Miss G— was a pretty, attractive girl, not at all accustomed to roughing it; but she found herself all at once most unpleasantly scant of money, and with an inconvenient fondness for the velvet and roses of life. Being enterprising, and having no guardians to restrain her," etc., etc.—on to her success as a book-agent.

We submit that *any* work from such motives not only "compromises social standing," but lowers the moral nature. The scale may be a very long one, and Isolte may be at the head of it; but lower down are the crowds of girls who flock to the shops and work-rooms of the cities from the very same motives of love of dress and dainties; and beneath, there are yet deeper, unspoken depths.

Studies in English History. By James Gairdner, editor of 'The Parton Letters,' and James Spedding, editor of 'Letters and Life of Lord Bacon.' Edinburgh: David Douglas. 1881. 8vo, pp. 324.

This volume, edited by Mr. Gairdner, contains two articles by the late Mr. Spedding, which, shortly before his death, he had agreed to publish in a volume of joint essays. Growing directly out of his studies upon Lord Bacon, and being distinctly of an historical character, they had not been included in the volume of 'Essays, Literary, Political, and Philosophical.' These two papers are the longest in the volume. The longest, of seventy pages, is the "Review of the evidence respecting the conduct of James I. in the case of Sir Thomas Overbury." *Causes célèbres* always form fascinating reading, from the element of mystery that attaches to them, and the ingenuity and intellectual grasp displayed in their investigation; and the murder of Sir Thomas Overbury has cast almost as dark a shadow upon the character of James I. as that of Darnley upon the character of his mother. Mr. Spedding's paper is devoted to examining the relation of James to this case in the light of certain newly-discovered evidence. He remarks (p. 177) that the evidence does not affect the case against the Earl of Somerset, which at the time "was hunted out with the greatest diligence, studied and sifted with the greatest care, and set forth with the greatest skill and clearness"; nor is it "likely that any new evidence will be discovered by which the aspect of his case will be materially altered. Not so with regard to the charges against the King—charges not only not sifted by judicial process at the time, but not made or thought of till long after the time when any sifting was possible." The case against the King consists, first, in the fact that Somerset's trial came just at the time that Villiers was rising to the position of favorite, so that the King has been suspected of "seeking a pretext to get rid of his old favorite"; and, secondly, in a threat made by Somerset, that he would divulge some secret discreditable to the King, which has been supposed to be the cause of the pardon extended to Somerset and his wife after conviction. The new evidence—part of it discovered some years ago, but "the true bearing of which upon these questions does not appear to have been understood"—is reviewed and examined by Mr. Spedding in a very lucid manner; and he appears to be wholly justified in a conclusion favorable to the King. The correspondence examined in this paper witnesses, not to a cooling of affection on the King's part before the Overbury affair, but to an affection "painfully alive, passionately loyal, bitterly resenting the inadequacy of the affection with which it is requited, and earnestly desiring to be restored to its former condition" (p. 187). And for the other and more damaging charge, "there is not a single movement, from the beginning to the end, such as you would have expected from him had he been acting under a guilty consciousness that he was in Somerset's power" (p. 235)—"if you suppose him guilty, it is impossible to explain the facts."

Mr. Spedding's other paper is entitled "Negotiations with Spain in the fifteenth century—Katharine of Arragon's first marriage," to which Mr. Gairdner's paper upon "Katharine of Arragon's second marriage" is a sort of sequel. Both papers originally appeared in *Fraser's Magazine*. The twelve years of the negotiations described by Mr. Spedding (from 1489 to 1501) have all the interest of a game for high stakes between two accomplished gamblers, in which Henry fairly held his own against the most astute King in Christendom. The events described in Mr. Gairdner's article possess more human interest, which is centred about the poor girl left a widow in a strange land, neglected alike by her father—who no doubt "would have been happy . . . if Katharine could have been relieved without any sacrifice on his own part"—and her father-in-law, who nevertheless showed a certain compassion for her deserted situation. Of Henry's conscientious scruples in the matter, Mr. Gairdner says: "It was no high question of what was best and noblest, suggested by a delicate moral sense which refused to take counsel with personal desire. It was the scruple of a conscience that regarded nothing but legality, . . . the conscience of a statesman of the age of Machiavelli, who thought even heaven and hell depended on the construction of a code of criminal law, and was quite as ready to cheat his Creator as his fellow-creature, by doing the shabbiest act that would not be visited with damnation." "Altogether," he says, "the negotiations on the subject do not leave a very agreeable impression of diplomacy in the days of Henry VII."

Mr. Gairdner has five other papers in the volume. Two are upon the "Lollards," the republication of articles in the *Fortnightly Review* upon "Bible Study in the Fifteenth Century," but considerably altered, as having expressed sentiments which he no longer holds, being "only too much in harmony with the sceptical spirit of the age." This is followed by an interesting paper, also bearing upon Lollardy, "On the Historical Element in Shakespeare's *Falstaff*." That the character of *Falstaff* had some connection with the Lollard martyr, Sir John Oldcastle, has been generally admitted; the paper in question undertakes to show that the general in the French wars of Henry VI., Sir John Fastolf, also formed an element in the tradition, and that he too was a Lollard. He sums up, at the end, by saying that "the *Falstaff* of Shakespeare, much as it undoubtedly owed to the rich imagination and incomparable wit of the dramatist, was an embodiment of traditions respecting two distinct historical personages—traditions largely tinged with prejudice, but still not unworthy to be considered, as reflecting the opinions of the age, and preserving, at the same time, some little details of genuine historic fact which, if they had not been stereotyped by genius, would by this time have perished irrecoverably" (p. 77).

The two closing papers are perhaps as interesting and important as any. That upon "The Divine Right of Kings" traces the origin of this doctrine, in the peculiar circumstances under which James I. ascended the throne of England, and its history down to the publication of Filmer's 'Patriarcha.' In connection with this, Filmer's other writings are briefly described—"it is not mere sagacity, but shrewd common sense that strikes one as their principal characteristic"—and his theory of civil government discussed. This theory, says Mr. Gairdner (p. 284), "it seems to me quite as easy unduly to depreciate as it proved possible to over-magnify it in the seventeenth century." The last article, "Sundays, Ancient and Modern," gives an interesting account of the way in which the Puritanic observance of the Sabbath came into existence. Here we are told (p. 313):

> "Though based on principles the most erroneous, the Puritan Sunday has been of undoubted service to us in the organization of our social life. Dull and cheerless as it was, and cruelly as its heavy discipline was maintained, it has been attended with an amount of good which has more than compensated the worst evils it has wrought. . . . The great boon of the Puritanic Sunday has been a lesson of self-denying earnestness, which sprang from strong and well-defined convictions transmitted from father to son during the last two hundred years—a rich inheritance, which I trust we may yet preserve amid the growth of new ideas and the remodelling of opinions. . . . It will not do to imagine we are doing God service in putting down Sunday trains or fining Sunday haymakers. Let us diminish Sunday labor as much as possible; but for man's sake, not for God's."

Robert Hall. By the Rev. E. Paxton Hood. [Heroes of Christian History.] New York: A. C. Armstrong and Son. 1881.

"No adequate life of him has ever been written," writes the author of this latest attempt to set Robert Hall before the public, in the last chapter of his work. As he himself charitably supposes of Hall's other friends, he, too, may have done his best. But he must have had a poor conception of the proper function of a biographer when he sat down to execute one of the most ill-digested and imperfect biographies ever offered in such a form. The outlines of Mr. Hall's public life are barely indicated; hardly even a skeleton of him has been constructed; and there is little or no attempt to portray the living, breathing figure of the man, to trace the development of his inner, spiritual life, or to analyze its secret springs. Nearly one-half of the book is padding, in the shape of extracts from previous biographies or Hall's own works, out of all proportion to the limits of such a composition. And, in a volume of 192 pages, fifty pages are devoted to a consideration of Hall as a public speaker, as if that were his chief claim to public regard.

With an almost ludicrous simplicity, the author shows how possible it is for sectarian prejudice so to warp the judgment as completely to invert the true relations of things. "Hall was probably the greatest sacred orator of all time." He even disputes the palm with Demosthenes himself; as the ancient world produced but one Demosthenes, so the modern world has produced but one Hall, compared with whom "all other of our sacred speakers seem good common-sense talkers, or speakers through whose thin veil of artificial rhetoric and clumsy climax the mechanical preparation may be too obviously and painfully seen." From such a point of view he stands far above Bossuet and even Massillon; and Shakspere, "our great modern German master,

Goethe," and Thomas Carlyle are all employed as foils to set off Hall's greatness as an original thinker, possessed of "the mighty gift of the first-rate order of intelligences by which they draw out our own nature, and set forth in the light of our own knowledge that which had been in us all along." That Robert Hall was an heroic man, all will admit who know anything of his life of constant suffering; that he was a great preacher many even now will not dispute. But the interest of his works was mainly temporary: they do not possess much human and universal and permanent interest. Questions unknown to his age are now pressing for solution, and the whole mental attitude of the time has changed. It is, therefore, a gross caricature of Hall to speak of him in the fulsome and uncritical fashion of these pages.

The author has formed a juster estimate of his life and work; an estimate, however, which it would be impossible for any reader to arrive at independently, from a perusal of the present compilation:

"Hall is a study. He was a Baptist minister, but he does not fit very nicely into the groove of any ecclesiastical sect. He had an objection to unions, and was altogether too magnanimously free to permit himself to be the mere mouthpiece of any human notions. In Protestantism he was unsound. He was so strong a Protestant that he was opposed to the claim of the Papal hierarchy for political place and privilege. Like John Milton, Andrew Marvell, and many other great Englishmen warmly attached to civil and religious liberty, he dreaded the power of Rome as inimical to both; but he was hostile to priestism in every form, whether found in the gown of Calvin, the cassock of Horsley, or beneath the cope of the Papacy.

"He bowed before the majesty of his powers the most exalted men of his time who heard him, and perhaps by his mingled enchantments of logic and eloquence hushed captious and thoughtless scepticism; but, after every eulogy, no sermon, even of Robert Hall's, was equal to his own personal character, and the majesty and dignity of his greatest words were not equal to his brave endurance of sharpest suffering, the sublime faith which sustained him through severest trials, and the extraordinary unconsciousness which, while acclamations on every hand acknowledged him as the prince of preachers, led him to regard himself as one of the most ordinary children of men." (Pp. 192, 151.)

Schule und Heer. Von Aug. Guhl. ["Deutsche Zeit- und Streit-Fragen," Nos. 159, 160.] Berlin. 1881.

THE German school system, admirable as it appears to foreigners, gives rise to much dissatisfaction at home. There is a general complaint of half culture and superficial knowledge, and much difference of opinion as to the remedy. Writers distinguished in various walks of life, as well as professional pedagogues, have taken part in the discussion, which is but a renewal of the old controversy between classical and non-classical studies. The special form which it now takes is a direct attack on the real-schools. These schools were originally intended for that section of the middle class of the population which did not aspire to enter one of the learned professions or the higher branches of the public service, and therefore was not obliged to pass through a university, but which, nevertheless, did aim at a higher degree of culture than the elementary schools could offer. The Government, which in Germany regulates everything relating to education, occupied itself with these schools as far back as 1832, and in 1859 promulgated a system of instruction and examination which fixed the status of the real-schools permanently. As now constituted, they have, like the gymnasiums, six classes, of which the highest is called "Prima," and the lowest "Sexta." The entire course covers nine years, each of the three lower classes occupying one year, and each of the three upper classes two years, the age of entrance being from nine to ten years, and of graduation from eighteen to nineteen. There are also real-schools of the second rank, which omit the highest class. The course of studies differs from that of the gymnasiums in omitting Greek, giving fewer hours to Latin and more hours to mathematics and the natural sciences, and adding English.

These schools have been largely patronized, and have owed much of their patronage to an important privilege enjoyed by their pupils in common with those of the gymnasiums—the privilege, namely, of serving in the army for one year as volunteers, in place of the compulsory three years' service of the masses of the population. This privilege can be acquired either by passing an examination or (without an examination) by producing a certificate from a gymnasium or a real-school of having attended for six years and having passed all the school examinations for promotion. The natural consequence is, that every parent who can afford it sends his boys to the real-school, so as to have their term of military service curtailed, and as soon as this point is gained, many of the boys leave school and go into business; in other words, their schooling stops at the age of sixteen instead of eighteen, and remains fragmentary. This practice accounts for the circumstance that while in the gymnasiums about one-fourth of those who enter complete the course, in the real-schools the proportion is reduced to one-tenth. Even this is the artificial product of a fresh privilege acquired in 1870 (as stated in No. 860 of the *Nation*)—the admission of graduates of the real-schools to the universities.

It is this state of things that is deplored and sought to be remedied. The advocates of the classical training, who are strong in official and professional circles, accuse the real-schools of being neither the one thing nor the other; of not preparing their pupils for practical life any more than for the university; of sending out a mass of boys who are half educated, filled with crude ideas, and puffed up with self-conceit. These writers would remodel the real-schools by dropping Latin and cutting down the course so that it should reach its termination at the age of sixteen, the scholars entering at six.

Of course the question has two sides. The teachers of the real-schools, a large and intelligent body of men, naturally resist any attempt to reduce them to a lower plane. They admit the need of reform, and—what may seem singular—in a convention held in 1874, they adopted resolutions demanding, among other things, that no one should be admitted to the privilege of one year's military service without passing a special examination.

The present pamphlet, although written by an officer of the German army, and avowedly treating the subject from a military point of view, takes its stand with the extreme wing of the classical school. The author agrees with Karl Hillebrand in dividing the German nation into three classes. Leaving the aristocracy out of the question, he places in the first class all those whose labors constitute the mental activity and leadership of the state, including in this category not only the liberal professions, but also merchants, manufacturers, professors, artists, architects, army officers, writers, etc.; all of these should pursue the full course of studies of a gymnasium, supplemented, if necessary, by the university or some other appropriate professional or technical school. The second class includes the lower grade of the middle class, such as shopkeepers, mechanics, innkeepers, subordinate employees in the public service, etc.; for this class there should be middle-schools, covering a period of ten years, from the age of six to that of sixteen, as already referred to above; and those who completed the course should be admitted to the privilege of one year's military service instead of three. Finally, the third class embraces day-laborers and the masses of the population generally, and for them the popular or primary schools as now constituted answer every purpose.

Of course this is but a bald abstract of Colonel Guhl's argument, but it sufficiently reveals the one striking point that he aims at—viz., that every member of the educated class should be required to possess a collegiate education; for it is unnecessary to remark that a German gymnasium is on a level, to put it moderately, with an American college. The same view is advocated by Karl Hillebrand in an article already alluded to. The latter writer, who was for a number of years examiner or inspector of the French lycées, says that in France every large merchant sends his sons to college, not only to graduate, but in many cases even to study law afterward; and it has not been found that young men so educated are inferior as merchants to those who, from their sixteenth to their nineteenth year, copy letters, sweep the office, and run of errands.

Some of Hillebrand's suggestions for reform, though not strictly cognate to the subject, are of such general interest that it may be permissible to mention them here. First, he would reduce the hours of labor in and out of school to eight. At present the school-hours in a gymnasium are from 7 to 11 A.M. in summer, and 8 to 12 in winter, and from 2 to 4 P.M. all the year; besides which, two to three hours' study at home is necessary. To accomplish the curtailment, he would abolish some studies and shorten others. And here comes the strangest part of his scheme, and the one that will excite the most opposition. The study of German, the native language of the scholars, he would restrict to grammar and orthography; and he would abolish the study of literature, on the ground that it only supplies unformed minds with ready-made judgments, and instead of stimulating the study of great authors, produces a disinclination to read them. He is also much averse to any scientific teaching. His most practical suggestion is to drop all teaching of religion to boys over fourteen years of age. In view of the well-known attitude of indifferentism to religion of the educated classes in Germany, it may well seem that the time devoted to religious instruction is a sheer waste. The main point, however, is here again, that Hillebrand insists that the pure classical training has such virtue in rendering the mind vigorous and flexible that any one who pursues it up to his nineteenth year can then undertake any pursuit or any study he pleases, and will soon outstrip all competitors who have had any other sort of training.

Manuel d'Archéologie grecque. Par Maxime Collignon. 368 pp., 141 engravings.

La Mosaïque. Par Gerspach. 272 pp., 68 engravings.

Histoire de la Peinture hollandaise. Par Henry Havard. 288 pp., 92 engravings.

Précis d'Anatomie à l'usage des artistes. Par Mathias Duval. 336 pp., 77 engravings. All 8vo. Paris: A. Quantin; New York: J. W. Bouton. 1881.

WITH the above four treatises begins a series of school-books in art which promises to number, in time, not less than a hundred volumes, covering an immense variety of subjects, both general and special. The prospectus of the series observes that

"The youth of our schools, who devote ten years to the humanities, search the courses in history in vain for exact treatises touching upon the wonders of antique art or upon the

movement of the Renaissance. In the graduate's memory as he enters upon life there may remain a few names, more or less high-sounding, to which he attaches no clear idea either of the men or of their works. Later, when he is drawn into debates upon artistic matters, he will sadly recall the relative ignorance in which his classical studies left him. It will be too late to repair this gap in his education, and time will fail him to attack the great works which exist, but which are too complete or too special. . . . In view of this lack, action in other countries has not been wanting. Among our neighbors there is not a special school without its course in the history of art, and all this instruction, given by a multitude of experienced teachers, is encouraged by a host of publications of every sort. . . . In justice, it should be said that the Government has not neglected to begin a similar movement among us. . . . But an essential condition for all this new education is lacking: *the book*. Masters and pupils are unanimous in demanding it."

To meet the want in France thus lucidly set forth, M. Havard has undertaken, under the patronage of the Department of Arts, the editing of this extensive "library." There is to be a volume on the general history of art; one each upon painting, sculpture, architecture, ornamentation, engraving, and music; and special treatises upon French, Italian, Spanish, and English painting, Italian and French sculpture, ancient, Italian, and Gothic architecture; Etruscan, Roman, and Oriental archæology; Byzantine art, ceramics, tapestry, wood-carving, construction, jewelry, glass, ivories, bronzes, stuffs, costume, etc. Such an encyclopædic range of topics would, perhaps, inspire only distrust were it not for the competent writers to whom many of these works have been already assigned, for the distinct promise of a pervading "spirit of method and clearness, shorn of the trappings of useless erudition," and especially for the conspicuous excellence of the four volumes just published. The superficial attractiveness of these tastefully printed and covered octavos, their compactness and vividness of statement, their wise illustration, and their reasonable price (3.50 fr.) will combine to make them exceedingly popular. We could wish that some enterprising American house would arrange for the translation and publication, under competent editorial superintendence, of all or most of these manuals. We are sure that they would be widely used and appreciated.

The volume on Greek archæology, for instance, in the hands of an intelligent instructor or an inquiring student cannot fail to give a charming and correct idea of the indispensable outlines of that fertile field of historical study. We know of no other work which treats the subject with anything like the fairness, the clearness, the restrained enthusiasm, or the fulness of this. Questions which are still unsettled are stated simply and candidly. The vital point of every topic is seized and emphasized as such. The real attractiveness of the subject in hand is not spoiled for the reader by being continually insisted upon; it is simply implied and assumed, so that his curiosity is continually kept alive. The several divisions of architecture, sculpture, modelling in terra-cotta, vase-painting, coins and gems, bronzes and ornaments, are all taken up and set in that due relation to each other which it has taken archæologists so long to learn to appreciate. To the whole is prefixed a singularly good statement of the origins of Greek art. However the special student may regard the author's cautious statements upon disputed points, or may regret that greater space was not devoted to his specialty, he must grant that the general method and spirit of the book are excellent. We should think that for use in this country, or even in France, an extension of the lists of authorities given at the head of each chapter was desirable, if not necessary, to give the student a clew to the sources of the matter summarized in the text. The author is not infallible, as his bad blunder on p. 65, about the *module*, shows.

The 'Anatomie artistique' is an abridgment of lectures given for the last ten years to the students of the École des Beaux-Arts, and embodies those topics which experience and consultation with practical artists have proved to be important and interesting. It is supplied with an index of the parts of the body which are described. The 'Peinture hollandaise' is of course both generally historical and biographical. The extent of its range appears from the long list of artists to whom reference is made. The history of 'La Mosaïque' begins with the works mentioned in classical literature, and comes down, century by century, to the present time. It has indexes both of places and of artists.

The Rose. By H. B. Ellwanger. New York: Dodd, Mead & Co.

THIS capital little book is the work of a writer who has a thorough knowledge of his subject, and knows how to convey it to others in sound and clear English. The amateur rose-grower will find here, in small space, a great amount of safe information and useful suggestion. On the vexed question of the classification of roses, Mr. Ellwanger takes very sensible views. The grouping found in the catalogues of nurserymen is becoming too complex for the average brain, and, as it has only very partially a scientific basis, it is high time that the complicated divisions and subdivisions with which many rosarians delight to perplex mankind should be reduced to something like simplicity. The chapter on typical roses is excellent. The description of varieties in the latter part of the volume, though in some cases the writer's experience does not answer to ours, is, as a whole, the best we know, and we advise all who are making a collection of roses to take counsel of it.

The Classics for the Million: Being an Epitome, in English, of the Works of the Principal Greek and Latin Authors. By Henry Grey. Second edition, revised and enlarged. New York: E. P. Dutton & Co. 1881. 12mo, pp. 348.

OF the numerous popular books prepared of late years to introduce the classical authors to non-classical readers, Mr. Grey's 'Classics for the Million' is a fair example, with some merits of its own. It consists for the most part of epitomes of the several works of the authors, sometimes with examples; and this work—if it is worth doing at all, for general readers—is done very well. There is not much satisfaction or real profit in reading an outline of a story or a drama; but some readers have a fancy for this, and for these this book may be recommended. Other merits it does not aim at. It makes no pretence to literary criticism or history, and the lives of the authors are exceedingly brief. The date of death is given (how, by the way, is it known that Homer died B.C. 850, Herodotus B.C. 413, and Tacitus A.D. 118?), but that of birth regularly omitted. In the list of translators in the appendix, the names of Bryant and Cowper are omitted.

Fine Arts.

THE TWO OIL-COLOR EXHIBITIONS.—II.

BEFORE commenting in detail upon a few of the works in these exhibitions, it will be well to premise that we assume the criterion of truth to nature to be a fundamental one. All painting, save that of a purely abstract and decorative kind, represents natural objects more or less fully, and is to be judged according to its veracity of representation—which is the true basis for all higher principles of design. Without this basis art inevitably wanders off into meaningless vagaries. But by truth to nature we do not mean exact imitation of physical facts, with which, as such, an artist has nothing whatever to do; we mean, rather, truth to visual impressions. It is a painter's business to know how things look, and to portray their appearances. We cannot attempt anything like a thorough review of either exhibition; we shall simply offer such remarks as suggest themselves on a few of the pictures in each. We will speak first of some of those in the Academy.

Mr. George Inness is represented here by two landscapes, Nos. 298 and 517. The first, called "Under the Greenwood," is one of this artist's most mannered works. Two beech (?) trunks, ungraceful in line and awkward in arrangement, occupy the middle of the canvas. Beyond them is a dead, blank mass of green paint—of that unnatural and unpleasant quality, in which something like Prussian-blue predominates, peculiar to Mr. Inness—which stands for a background of woodland. There is no characterization, hardly even a suggestion, of form or of parts in it, save one rigid, vertical tree-trunk without ramification. The masses are unrelated and scattered, the greens of one quality, and the execution the same for near and distant parts alike. Mr. Inness never gives us a decisive form, never a well-defined contour. Everything with him is softened, and is, as it were, melting away. His work lacks a firm basis of drawing. No. 517, "A Winter Morning—Environs of Montclair, N. J," is of different, and more interesting,

character. It represents an expanse of characteristic American winter landscape, with patches of snow lying about here and there. It is not a graceful design; indeed, it cannot be called a design at all. It is a simple portrait of a passage of open pasture-ground and thin woodland, with a distant house or two of bald and staring American type, and some vaguely-drawn logs and stumps in the foreground. In broad effect it is, however, very true, with a look of open winter daylight. Mr. Inness frequently exaggerates his light and shade, but in this picture, and in others like it, he is temperate and exemplary.

Mr. Eastman Johnson has two portraits, Nos. 173 and 210. These are quiet and natural in conception, and are firmly and well drawn. But the execution is slight and sketchy, and wanting in solidity; and in the flesh there is an unpleasant and untrue quality of pink and purple, and a want of correspondence between the parts in light and the parts in shade. Mr. Johnson seems to have acquired a settled manner, which he employs for everything. In each subject that he treats he seems not to observe sufficiently what the actual visual conditions are, but rather to proceed in the same way, and with the same pallet, for everything. In Mr. Huntington's "Portrait of a Lady," No. 290, which occupies one of the best places on the line, there is a conventional rather than a true grace of pose and figure. The hand which falls from the arm of the chair is weakly sentimental in this regard. The color, too, is unnatural; it is conventional studio color. In painting the lady's dress and the red cover of the chair, Mr. Huntington did not truly observe the plain facts of their relative values. Mr. John F. Weir exhibits a large painting, No. 267, "The Theological Faculty of Yale College," in which all the personages represented have precisely the same complexion and the same quality of gray hair. This sameness is remarkable, if it be true. The picture is unpleasantly dark, as if everything had been painted into a freshly laid ground of ivory-black. Gravity of key might, indeed, be suitably chosen for such a subject; but gravity of key does not necessitate the suffusing every part of a design with ivory-black. Mr. B. C. Porter's "Portrait of a Lady," No. 189, is, for the most part, a good and finished piece of painting. It is injured, however, by excessive use of black and brown in the shadows, and the points of highest light in the eyes are a little too sparkling, and those on the nose and forehead a little too much emphasized for quiet effect.

No. 82, by Mr. Elihu Vedder, "Waves off Pier Head," is an excellent piece of chiaroscuro; but the color is wanting in purity and variety, and the drawing of the waves is hard and lifeless. No. 181, "The Golden Net," by the same artist, is a somewhat elaborate work, but is too equally and even mechanically elaborated. The drapery is unpleasantly cut up, and is very ungraceful in fold. The color is monotonous and untrue—an unpleasant yellow-brown hue running through every part. No. 371, a portrait by Mr. J. Alden Weir, hangs where it cannot be fairly examined; but it appears to have excellent qualities, not unlike those which are characteristic of Velasquez. These are much injured, however, by excessively strong brown shadows on the nose and cheek. Mr. Vinton's portrait of Wendell Phillips, No. 380, has strong qualities, but it lacks refinement. Mr. Vinton catches the outside, obvious characteristics of his subject; but he seems to get little beyond these.

Mr. F. D. Millet's "Milkmaid," No. 463, is an admirably-drawn and natural figure of a young woman walking forward on a meadow foot-path, with a pail of milk in her hand. It is a good subject, conceived without affectation. Mr. Millet is a plain realist; but he has not here done himself justice in all respects. The chiaroscuro of the picture is very untrue, and there is a want of decision and of significance in accessory parts which bespeaks insufficient acquaintance with the objects—weeds and grass—which the artist would fain represent. The figure is in shadow against a light sky, which, in nature, would make it tell as a decidedly dark mass; but Mr. Millet has not made it dark. A part of the arm which holds the pail falls against the slightly rosy lower sky, and is almost precisely of the same value and the same hue. This is both impossible and untrue. The picture has not the look of having been studied out of doors. The figure appears, rather, to have been painted from a model in the studio, and the landscape background to have been thrown in from memory without sufficient reference to the relation which would actually exist between the one and the other in point of chiaroscuro. There is a picture in the South gallery, No. 270, "Feeling the Edge," by Mr. E. M. Ward, which illustrates the true effect of a figure in shadow against open sky.

Mr. J. G. Brown's works this year are about the same in character as usual. Mr. Brown is a conscientious and faithful worker; but, apart from the interest which attaches to the incidents of street-boy life, and other commonplace subjects (in depicting which he is very entertaining and successful), there is little of essential excellence in his painting. He regards his subject with a view to some incident or story, rather than with a true painter's eye. As a painter, he dwells too much upon a common sort of realism, and not enough upon the beauty of the aspect of things. Take No. 413, "The Neighbors," for example. Two old ladies sit chatting together, and one of them wears a white kerchief about her neck and over her shoulders. A true painter would have felt the value of this white kerchief as a total mass, and would have retained its breadth through whatever modifications of its local color the expression of its folds and the influence of neighboring objects might have required. But Mr. Brown, in seeking to make its folds look real, has emphasized their markings too strongly, and thus has lost breadth and the relation of the whole drapery to other masses. The shadows in it are wrought with the same brown color that is used in the flesh and other parts.

Of works by others of the older Academicians there are few which call for special comment. Mr. J. F. Cropsey exhibits a large landscape, No. 69, "Lago Maggiore, Italy," which is highly conventional and false in color. The broken foreground of grass and earth is rendered with crude green and vivid orange hues, totally uninfluenced by the modifications which nature could not fail to exhibit under the conditions of light and air represented. A group of figures to the right of the composition are unfeeling and untrue in this crudeness of untempered paint.

Mr. Casilear exhibits a landscape of the same conventional type with which he long ago made us familiar. Mr. S. Coleman and Mr. A. D. Shattuck have largely lost what fresh integrity they showed formerly, and have adopted the prevailing French manner without having taken firm hold of the good qualities of French art. The case is much the same with the rest of that group of men who were the recognized leaders in our exhibitions a quarter of a century ago. There is one picture in the corridor, No. 664, "Study of Trap Rock," by J. Henry Hill, which contains more good painting than any other picture in the galleries. It represents a passage of rocky ravine, with light cascades leaping from ledge to ledge. The picture is quiet and true in all respects. Everything in it is perfectly and felicitously characterized, yet it is broad and true in total effect. Such sincere and affectionate rendering of simple nature is the best outcome of all our artistic activities thus far.

On entering the gallery of the Society of American Artists one notices a pervading harmony of tone in all the pictures. This has been commented on as a sign of excellence unusual in exhibitions of American pictures. But such harmony as this is attained largely by a method of subduing all colors by a uniform tone of gray or brown. It is not the harmony of living and ever-varying color, which is attained by simple veracity as regards their mutual values. We want, in painting, the harmony which consists with nature's beauty and variety of color, not a uniform harmony of this conventional kind. No. 1, "Winter," by Mr. E. A. Abbey, is a remarkably good piece of drawing, and there is more in it of grace, in general pose and movement of the figure, than one often sees; but it is too slight and sloppy in execution to be considered as anything more than a sketch for effect. No. 8, "Autumn," by Mr. Edwin H. Blashfield, is also a gracefully posed, firmly drawn, and forcibly painted figure. No. 29, "Girl Reading," by Mr. William M. Chase, is one of those bizarre and ungraceful subjects of which we have already expressed our disapproval. There is some good chiaroscuro in this picture, but the execution is slovenly and meaningless in the extreme. The drawing of the gown of the figure, with its pattern, is quite beneath criticism from any point of view. In No. 33, "Portrait of a Lady," by Mr. Frank Duveneck, the head seems out of relation with the surrounding parts in point of chiaroscuro. It tells as a strong spot of light, while the remaining parts of the picture are not illuminated in a corresponding degree.

No. 42, "Evening—Lorette," and No. 43, "Priscilla Fauntleroy," are by Mr. George Fuller. Beyond a certain vague sweetness of expression, we cannot find much to admire in these pictures. The misty obscurity which enshrouds them is altogether untrue to any known effects of nature, save, possibly, those which occur in the densest of London fogs. The figures are bad in drawing, indeterminate in handling, and impure and monotonous in color. It seems as if the artist, in a state of but partial wakefulness, were vaguely striving to embody some half-forgotten dreams. Mr. A. Quartley's pictures, Nos. 79 and 80, while apparently aiming at true color-values, are frequently faulty in this respect. In No. 79 a distant steamer to the right hardly differs in quality or in density from one of the nearest dark objects in the picture. The same may be said of No. 114, "City of Dort," by Mr. J. H. Twachtman, in which some of the most distant objects are presented in strongest force. No. 120, "Portrait of a Lady," by Mr. J. Alden Weir, is a picture which, we think, possesses few of the qualities of good painting. The execution is unfeeling and painty in the highest degree. A heap of flowers (?) are laid on as with a bricklayer's trowel, and the result is simply a repulsive mass of thick paint. Nor can we detect greater merit in the two or three other pictures exhibited here by Mr. Weir. The bizarre in method seems to be his chief aim in them all, and we find few excellent qualities underlying it.

It is hardly necessary to extend our remarks. We have selected for comment a few of those pictures which seemed most to call for it. If we have pointed out more faults than good qualities, it is because we feel that such good qualities as exist are already widely and sufficiently appreciated, and that the right direction of public taste in the future calls urgently for clear showing of the dangerous tendencies which are so rapidly gaining ground in what is now called our new art movement.

NEW YORK, THURSDAY, MAY 4, 1882.

The Week.

MR. BLAINE'S friends seem to take Mr. Belmont's "jumping on Jim Blaine"—their technical name for criticism of that statesman's performances—very much to heart. The *Tribune* reproduces a number of editorial articles in which Mr. Belmont is pronounced a "little blackguard," "an ass," a "presumptuous little cur," a "poltroon," a "woodchuck," a "catspaw," a "servile parrot," a "pigmy," a "young jackanapes," with much other severity of the same sort. This, however, is not interesting to the public, which is not curious about Mr. Belmont. The person it wants to know about is Mr. Blaine; and the Washington correspondent of the *Herald* intimates that the Senate Committee on Foreign Affairs will probably try its hand at examining him about his Peruvian troubles, and may find him more tractable. Among the things which he did not tell Mr. Belmont, but which we should all like to hear, are, according to this authority, how he came to compel Mr. Christiancy to recognize as a *de facto* Government Señor Calderon, who had so little *de facto* about him that he was arrested by a policeman? What "the personal talk" was which General Hurlbut said he had with him, and which supplied him (Hurlbut) with "the motive for his action"? Why he rebuked Kilpatrick when he had obtained from Chili everything he was instructed to demand? Why he never wrote to Hurlbut about anything but the Landreau claim? Why he thought the mild concurrent resolution of the House about the Landreau claim mandatory when the Senate had refused to concur? It would also be well to ask him what he means by "*res adjudicata*," a phrase in which he evidently finds much balm. If there be any mode of addressing these questions to Mr. Blaine which he will not consider offensive, they ought to be put by some elderly man.

Nothing has been more entertaining in Mr. Blaine's examination than the part the British bondholders and fleet play in his imagination. The payments Chili proposes to make to the bondholders out of the guano already pledged to them as security, he treats as simple plunder, having apparently the Kearney notion of a bondholder. The Chilian war against Peru was a "put-up job" of the bondholders, of much the same character as that "in which Clive and Hastings subdued India," undertaken for "loot and spoil." Moreover, he said with much solemnity in the little stump-speech on this subject which he injected into his examination, that he "saw by the morning paper that there was an English war fleet of seven great iron-clads along the coast from Callao to Valparaiso, and that they had been there all the time." In fact, he seems hardly ever to look out of his window just now without seeing the British fleet anchored to a guano bed, like Little Billee in Thackeray's ballad, who, when he went to the masthead, discovered, to his astonishment and relief,

> "Jerusalem and Madagascar,
> And North and South Amerikee,
> The British flag a-riding at anchor
> With Admiral Napier, K. C. B."

Senator Blair came forward with his Peruvian testimony on Monday, and read a statement which he said was "prepared in a somewhat hurried manner," though why it should have been, seeing that it is two months since the investigation was ordered, we fail to see. He acknowledged that he took a "retainer" from Shipherd, but did not explain what it was for. The claim of Shipherd to the Peruvian guano could not be prosecuted in the courts of the United States. It would have to be prosecuted either in the Peruvian or Chilian courts, if in any—in neither of which is Mr. Blair a recognized practitioner—or through the active intervention of the Government of the United States. But of this Government Mr. Blair was, when he took the retainer, himself a part. If it was proper to push Shipherd's claim through American diplomacy, Mr. Blair would have been bound to aid it as Senator; and in approaching the question whether it should be pushed or not, he should have had his mind clear of any bias arising out of personal interest. Otherwise, the retainer might operate as hire for driving the United States into war. When retained in August he first asked Shipherd for a fee in money, but Shipherd was better supplied with scrip of the Company than cash, and though he said that the counsel might have money if he preferred it, he only gave him scrip, and this in October, after a long delay. During the interval Mr. Blair appears to have gone on encouraging him, and urged him on one occasion to act as "though American ships-of-war were on their way" to Peru. Soon after getting the scrip, however, he seems to have lost heart, or had his scrupulousness increased, for he threw up his retainer, and on the 25th of November sent back the scrip. November was a bad month for poor Shipherd, for it was on the 17th of that month that Mr. Blaine threw him overboard, and on the 23d that General Hurlbut declined further correspondence with him. Mr. Blair now explains that what he meant by American ships-of-war being "on their way" was that they were to be sent there, the same as "the English ships had been." But then English ships, as Mr. Blaine has bitterly observed, had been there all along, watching that guano, and if the American ships were to accomplish any good by going down, it would be by driving the English away from the guano, and loading it up themselves as return cargoes. Mr. Blair will evidently richly repay cross-examination.

Senator Ingalls dealt a stunning blow to the Anti-Chinese Bill in the Senate on Wednesday by asking Senator Farley, who was very eloquently describing the Chinese as a horde of loathsome lepers, the simple question why it was, if the Chinese were such repulsive and worthless wretches, that the people of California insisted upon employing them, and thus keeping them in the country? The California Senator found this a very hard question to answer. We do not wonder it staggered him. As we are told, the people of the Pacific Coast are unanimous and uncompromising in their determination that the Chinese are a nuisance and must go. And yet the same people of the Pacific Coast are doing all they can to keep the Chinese among them by employing them and paying them good wages, and by trading with them and giving them good profits. The very moment the people of the Pacific Coast cease to employ the Chinese or to trade with them, the Chinese will go of themselves, without any compulsion, and they will stay away without any law to keep them out. The people of the Pacific Coast therefore have the matter entirely in their own hands.

The Anti-Chinese Bill in its new form has passed, but it is melancholy to relate that the Republicans get no political capital out of it. In the House there were eight more Republicans than Democrats in the majority which passed it, but then there were thirty-one more Republicans than Democrats in the minority which voted against it. In the Senate nine Republicans only have voted for it, while fifteen voted against it, so that it is substantially a Democratic measure, and entitles the Democrats to whatever gratitude the Pacific Coast pays for measures of this character. It is, moreover, very distinctly Democratic both in its ideas and processes. It carries out, as against the Chinese, the doctrines which the Democrats upheld for thirty years before 1865—such as the unfitness of particular races for social or political rights, and the compatibility of the passport system and fugitive and expulsion laws with American institutions.

The present bill reduces the period of suspension from twenty to ten years. Even ten years must, however, be considered a very liberal construction of the clause of the treaty which provides against prohibition. The passport and registration feature has been modified, but not greatly modified, and the skilled laborers have been joined with the unskilled in the exclusion. In fact, the Chinese must be a good deal puzzled about the source of the hostility to them. On one day they hear that they must "go" because they are so barbarous and uncivilized; on the next, because they are so skilful and intelligent. The treaty permits the United States Government to exclude Chinese "laborers." The term "laborers" was undoubtedly used in the sense in which it is ordinarily used here, to designate unskilled laborers. It has, however, in the bill been made to cover artisans and mechanics, and there can be little doubt that the Chinese will consider this a quibble, and will wonder if Christian morality sanctions such things. An attempt to prohibit expressly the naturalization of the Chinese now in the country was luckily defeated in the Senate, but there was something very characteristic about it.

It is natural that those who desire to expel the Chinese both because they are barbarous and because they are civilized, and who desire to expel them because they refuse to be naturalized or "assimilated," should also desire to forbid their being naturalized or assimilated if they wished it. Everything about this Chinese agitation is characterized by the most delightful absurdity.

General Chalmers, of Mississippi, has been deprived of the seat he wrongfully occupied in the House of Representatives, and Mr. Lynch, a colored man, who has served in Congress before, has been declared entitled to that seat after a thorough inquiry. The evidence laid before the Committee on Elections was so conclusive in proving him to have received a large majority of votes in his district, that the friends of General Chalmers seemed to have absolutely no ground to stand upon, if they paid any regard to the principle that a majority of lawful ballots in the box is to determine an election. As is reported, a good many Democrats privately admitted that they could not conscientiously vote to give the seat to General Chalmers. The frauds by which Lynch had been kept out of his right had been of too gross and barefaced a nature to be denied or seriously defended. And yet, in spite of all this, every Democrat in the House of Representatives who voted on this question, except Mr. Ellis, of Louisiana, voted to keep in General Chalmers, and to deprive Mr. Lynch of the seat to which he was so clearly entitled. Some, who were ashamed to put themselves openly on record against their convictions of right, abstained from voting; but only one had a sense of justice strong and courageous enough to vote "against the ticket." This, however, is no new thing. It is only the latest illustration of the most detestable and demoralizing practice followed for many years by both parties in Congress, Republicans as well as Democrats, to vote in deciding contested-election cases simply the party ticket, without any regard to right or wrong. This is done in so cynical a manner that it seems as if members of Congress had lost all feeling of the moral obliquity of it, and as if the strongest appeals to higher motives of action were and would remain unavailing. It is very evident that under such circumstances Congress is not the proper authority to decide contested-election cases, and that in order to secure justice and to arrest the infection of such demoralizing practices, it will be necessary to look for some judicial tribunal outside of Congress, to which such cases can be submitted with the assurance that evidence will receive its due weight, and that the man justly entitled to the seat will have it, no matter whether his party is in a majority in Congress or not. In England, such contests about seats in Parliament have for many years been decided by the ordinary courts, like the title to any other office, to everybody's satisfaction.

The *Independent* last week gave an account of the attitude of the religious world toward Darwinism which will seem strange reading to those who remember the way in which the 'Origin of Species' was first received. It says "the attitude of the Church toward him" at that time, "more hostile than suspicious, is an occasion for deep mortification." . . . "No man of the age was so feared and hated by the large body of Christian teachers—we will not say all—as was Darwin." "The attitude of the great mass of religious dogmatism to this new philosophy was no less than scandalous." "At the meeting of the Evangelical Alliance in New York, Dr. Hodge read a paper to prove that 'Darwinism is Atheism'; but now there is probably not a professor in Princeton Seminary who would dare to make the assertion"—and much more of the same sort. And yet there never has been a scientific man whose character, and temper, and manner were so little calculated to exasperate opponents, or create doubts about his single-mindedness, as Darwin. Unfortunately, he was not the first investigator, whose conclusions are now universally accepted, who at the outset incurred the hatred of religious people, but surely he ought to be the last; and we think there is every reason to believe that he will be the last. It is hardly possible that so striking an example of the tremendous mistakes into which pious men may fall regarding danger to their faith, can fail to impress them with the necessity of greater caution and courage in their attitude toward the explorations of the physical universe which are now going on in every direction.

It ought also to put an end to the curious attempts, of which one every now and then hears from religious bodies, to make some kind of treaty between Religion and Science, in which each shall lay down certain limits beyond which it will agree not to go. All such schemes are based on the theory of which Darwin was the victim, that there is somebody competent to answer for Science, and say where it shall stop and what it shall examine. There is no such person. There never was and never can be. Religious men can draw up platforms on which they can agree to stand, and can trace the boundaries of their own beliefs, but a scientific man can do nothing of the kind. In fact, he is bound not to do it. Continued inquiry is to him a condition of progress. It is his duty to treat nothing in the physical field as settled, and nothing as beyond question. Science, too, for him does not mean what he believes, but what is; and therefore he never can tell to-day what he will believe to-morrow. Another lesson which we trust the Church has learned from Darwin's career is the folly and injustice of holding scientific discoverers responsible for what seem the probable moral or social consequences of their discoveries. Half the odium heaped on Darwin was due to this. It was thought, apparently, by many people that he ought to have kept the result of his inquiries to himself, lest it should unsettle some people's religious faith or loosen in others the bonds of social obligation. It now appears by the confession of his revilers that had he done so he would have committed a great mistake even from their point of view. They acknowledge that what they once thought were necessary or very probable consequences of his revelations were not necessary or probable consequences at all; that, on the contrary, these revelations were simply a flood of light on "the world's great altar stairs."

The President has sent a new message to Congress on the subject of the Arizona cowboys, who are still plundering and robbing along the Mexican border. He again recommends that operations of this kind—*i. e.*, what the late Mr. James, of Missouri, was in the habit of calling "scouts" across the border—be made punishable as an offence against the United States, and that the *posse comitatus* act of 1878 be repealed. This act, which was passed as a party measure to prevent the use of troops in the South, provides that no part of the Army shall be used as a *posse* for the purpose of executing the laws, "except in such cases and under such circumstances as such employment of said force may be expressly authorized by the Constitution or by act of Congress," under a penalty of fine and imprisonment. The penal character of the statute makes the risk of its violation a serious one for anybody, and there would seem to be every reason for its repeal. If it ever had any utility as a party measure, this can be the case no longer, for the day of "troops" in the South is over; while the use of them in the thinly-settled Territories, where society is in a half-organized condition, is a plain necessity. As General Sherman, in a telegram on the subject to the Attorney-General, says: "It is idle to expect of the miners and scattered ranchmen the difficult and dangerous service of a *posse* to arrest desperate cattle-thieves, smugglers, and robbers, well mounted and well armed, with thorough organization and sympathy of some of the people." The fact is, that in communities of this sort the *posse comitatus* is found too often in the hands of the very desperadoes it is called upon to disperse.

All domestic influences continue to favor an extremely easy loan market, and the surplus reserve of the New York banks was run up during the last week to nearly $11,000,000. The foreign imports continue so large that the revenues of the Government are accumulating much beyond the needs of the Treasury, and on Monday another call for the redemption of extended 6 per cent. bonds was issued by the Secretary of the Treasury, the amount covered by the call being between $10,000,000 and $11,000,000. At the Stock Exchange, United States bonds lost a fractional part of their recent advance. The low rates which can be obtained for money, either for short or long-date loans, is causing a great demand for choice railroad investments not subject to speculation. The share speculation during the week was characterized by a further decline in the Vanderbilt stocks, notably Lake Shore, which fell to 98¾, and New York Central, which fell to 123⅝, and by strength in the remainder of the stock list. The breakdown in the Vanderbilt stocks was helped, if not caused, by the publication of the annual report of the Lake Shore, which showed a heavy increase in tonnage, a large decrease in net income, and an increase of $1,250,000 in bonded debt. During the time covered by the report all the trunk-line companies suffered by the bitter war of rates which was waged. The condition of the crops thus far was never better. Immigration continues on a scale of unprece-

dented magnitude. In the foreign markets American securities have been nearly steady, but the buying here for foreign account has ceased for the time, and in its place there has been some selling.

The Cincinnati *Gazette* makes some pointed observations on the results of Prince Bismarck's protective tariff in Germany and its bearings upon American agriculture. The cost of wheat flour has been advanced to the German consumer 10 per cent., that of American bacon 20 per cent., butter 10 per cent., lard 40 per cent., beans and peas 10 per cent., and so on. There has been no corresponding increase in the wages of German workingmen. Consequently the conditions of life have been made harder in Germany. The importation of American farm products has been curtailed, and the exportation of German manufactures diminished, by the new tariff policy. The *Gazette* wonders how the American protectionists would like to have this policy adopted by European countries generally—a very pertinent inquiry, and one which they will be in no haste to answer. The first effect of such a policy would be to reduce the profits of farming in this country, in consequence of the foreign duty on American agricultural products. The next effect would be to set the Western farmer to studying the philosophy of tariffs. The pressure upon his pocket-nerve would cause him to master the subject in a very short space of time. He would then wax exceeding wroth, and his members of Congress would take a death-hug at the tariff. Whenever the Western farmers lift their finger in the way of admonition, protection in this country is doomed. Perhaps Bismarck's tariff will help some of them to see where their interests lie. If so, it will not be without its uses on this side of the water, whatever may be its effect at home.

Mr. Gladstone has made the announcement, which has been expected for some days, ever since the resignation of Earl Cowper, the Lord Lieutenant of Ireland, that the policy of the Government toward Ireland is to undergo a change; that the Coercion Act, which expires, we believe, in September, is not to be renewed; that the three imprisoned members of Parliament are to be released, and that the release of the other suspects will soon follow; but that there has been no bargain with the Parnellites, and that the payment of the arrears of rents will be provided for. All this was foreshadowed last week by the unusual suavity of tone in which Mr. Sexton, who is now the leader of the Home Rulers, spoke of Mr. Gladstone, and he has formally received the Premier's last statement as the first step toward the establishment of permanent peace and good-will between England and Ireland. Mr. Forster's resignation is part of the programme, the reason assigned for it being his unwillingness to share the responsibility of the new departure. But, of course, his withdrawal was a necessary condition of the change. No policy of conciliation could be carried out through him even if he were ready to try it, owing to the way in which, whether justly or unjustly, his administration of the Coercion Act has made him obnoxious. He has, however, in addition to this, fatal defects of manner and temper for any Irish office. He is one of those excellent Englishmen whom no foreigner can abide in any place of authority, simply because they are so good and conscientious that they feel they cannot make a mistake, and that there is a certain depravity in resisting them.

There is some talk of putting an Irishman in his place, and Mr. Shaw, one of the members for Cork, and a man of very high character, has been mentioned for it; but he has probably, as all other Irish members of his way of thinking have, the defect of not being sure of his seat. Any one who accepts the Chief Secretaryship would have to be reëlected, and it is generally believed that those Irish members who refused to accept the Parnell programme have no chance of being returned again, at least by any constituency in the south or west. This consideration, if well founded, would restrict the choice of the Ministry, if they determined to put an Irishman in the place, to the immediate followers of Mr. Parnell, and for one of these English opinion is probably not prepared. Consequently there is some danger that the process of conciliation may not be as thorough as any such process should always be. Half-hearted, grudging, and distrustful conciliation is hardly ever successful, and probably the happiest stroke Mr. Gladstone could now make would be the offer of the Chief Secretaryship to Mr. Parnell. If Ireland were governed simply for herself, this stroke he would probably make; but the great curse of Ireland is, and has been for centuries, that she has to be governed, not in the manner which will please Irish constituencies, but in the manner which will please English constituencies, so that the office will probably be again given to an Englishman. It is very questionable, too, whether Mr. Shaw, or any other Irish member of his type, would lose his seat if he took office under a régime of conciliation. At all events the experiment would be worth trying, and there can be no real turning over of a new leaf without it.

Lord Spencer takes the Lord-Lieutenancy for the present, having filled the office already when Mr. Gladstone was last in power, but there are rumors that it will be eventually offered to Lord Dufferin. Lord Dufferin has the merit for the place of being an Irishman, and a very clever and agreeable one, but he has for the present crisis the fatal defect of being a landlord who has spoken and written much against the Land Act, and is hostile to the Ulster Tenant Right, and has not been thought very generous or considerate in the management of his own property. There was a period in Irish politics when it was enough for a gentleman to be genial in his manners in order to be popular, but that time has long gone by. The Irish temper has changed much within forty years. It is now somewhat sour and suspicious, and allows nothing to excuse any unwillingness to meet the requirements of the prevailing political creed. The Catholic clergy have already had plenty of rather startling experience on this point, and no layman need look for allowances which have been denied to priests.

It looks now as if there was to be a race between the Conservatives and Liberals for the favor of the Irish tenants. The Ministry has admitted that the failure of the Land Act to deal with the arrears of rent in existence at its passage is a serious obstacle to the pacification of the country, and that these arrears will probably have to be paid by the Government from some source—admissions which seem to be working a reconciliation between Mr. Gladstone and the Parnellites. But now come the Tories, in the person of Mr. Smith, and propose to do better than this—namely, to advance any tenant all the money he needs to buy his farm from his landlord in fee, leaving him to make his own bargain, on such terms as to interest and repayment of the principal that he shall not in any one year have to pay back more than his present annual rent. This goes far beyond the purchase clauses of the Land Act, which only provide for the advance of one-third of the purchase money, and fix the number of years' rental on which the price shall be based. It is more than probable now that some grand and very revolutionary settlement is at hand, but it is both melancholy and true, that, if this great deliverance of the Irish tenant comes to pass, he will feel that he owes it, like so many other good things, to persistent murder, outrage and intimidation. These are the arguments, he perceives, which tell on the English mind. His groans and moans and entreaties and denunciations amuse the Saxon, who never believes that he means business till he gets a gun and begins popping at his enemies from behind hedges.

Mr. Montagu Williams, the counsel in the Lamson case, has written to the papers alleging that no suggestion of the prisoner's insanity was made to him by any one before the trial; that his instructions were simply to deny the murder and contest the conclusions of the medical chemists. This has been drawn forth by a suggestion of negligence in not pleading insanity which the unhappy father has made in his agony. It is obvious that if counsel were to be called to account for not pleading insanity every time a murderer who did plead insanity was hanged, even though his client never mentioned it, no other defence would ever be made, and the risks of the accused would be greatly increased. A plea of insanity is virtually confession and avoidance. In other words, a prisoner who makes it acknowledges the killing, but says he was not responsible when he did it. No counsel now dares to make such a defence without positive instructions from his client or the client's family, for it is essentially the plea of desperation. The assertion of one of our contemporaries here, that Mr. Williams's failure to plead insanity was due to the English usage which keeps barristers from communicating with their clients, would hardly have been made by one whose knowledge of English procedure had any better source than the report of Bardell *versus* Pickwick. No barrister ever defends a murderer without seeing his client.

SUMMARY OF THE WEEK'S NEWS.

DOMESTIC.

MR. BLAINE continued his testimony before the House Investigating Committee on Wednesday. He stated that in the diary of President Garfield no mention whatever was ever made of Shipherd, the Cochet claim, or the Peruvian Company. He produced the draft of the Trescot instructions, which was shown to President Arthur and amended at the President's suggestion, and denied that he had ever "interpolated a word, or a line, or a syllable, or an idea." He also denied that he had assumed to act as President *de facto*, or that he was engaged during the President's illness in "blocking out a great foreign policy and precipitating it on the country between the lives of two Presidents." Mr. Perry Belmont then proceeded to question Mr. Blaine, with a view to finding out what led him to press the Landreau claim, and a wordy sparring match ensued between the two. Mr. Blaine was witty but evasive, and did little to clear the matter up. On Thursday the examination was continued by Mr. Belmont, and an extraordinary scene ensued. Mr. Blaine complained that Mr. Belmont had misquoted his despatches, which Mr. Belmont refused to admit, saying that certain quotation marks were the mistake of the printer, but that the language of the despatches bore the construction which he (Mr. Belmont) had put upon it. After a few more words had passed between the two, Mr. Belmont said that Mr. Blaine's conduct had been such as to relieve him of all the consideration which he had intended to show to him as a man who had held the high position of Secretary of State, and that Mr. Blaine had now put himself on a level with any witness who might appear before the Committee, and he would proceed to examine him in that light. This inauspicious beginning of the examination led to an altercation—which was but the first of a series—in which Mr. Blaine said the "insolence of this young man (Mr. Belmont) is intolerable," and that he had no more regard for his insolence than "he would have for that of a garbage boy in the street"; and Mr. Belmont retorted that Mr. Blaine had had experience before committees, and had acted in the same way and for a like purpose, but that he would not do it again with him. The examination then continued, interspersed with scenes like the above, until Mr. Belmont remarked that he had finished his questions. Mr. Blaine then rose to make a statement, in the course of which he asserted that Mr. Belmont had intentionally misinterpreted his despatches, and requested that he should apologize therefor, and finished by saying that Mr. Belmont had stated "that which is not the truth, absolutely not the truth, and without any semblance of truth." Mr. Belmont then rose, considerably excited, and repeated that he was not responsible for the printer's mistake in regard to the quotation marks, but that the construction which he had put on the despatch was the correct one, and that he would leave it to those who "chose to read the despatch carefully" to decide between them. Mr. Blaine then repeated his statement in a different form, and Mr. Belmont, after repeating his explanation, said: "As to your reassertion about the character of my statement, my course of action in that regard will be conveyed to you in private. I do not propose to make any scene with you, or to make any capital one way or the other. You may do that if you please. I think that that is your method. I think that is what you are usually guilty of. I think you are a bully and a coward." To which Mr. Blaine replied: "Mr. Chairman, this man has disgraced his place. He is the organ of men who are behind him. He was put here to insult me. I beg to say that he cannot do it. I recognize that he is speaking for men behind him." After a few more words from Mr. Belmont, this extraordinary scene ended. It created considerable excitement in Washington, and rumors of challenges were rife. On Friday Mr. Belmont addressed a letter to the chairman of the Committee, in which he said that during the two days of the examination "provocation so gross and persistent was offered to me by the witness, that I was led to use language which, though unparliamentary, did properly describe his conduct and my appreciation of his character," and suggested that "these unparliamentary personalities be expunged from the records of the Committee."

On Monday Senator Blair, whom Shipherd had stated to be the counsel for the Peruvian Company, read a long statement before the Committee, largely devoted to a recital of the considerations of public policy which had caused him to take an interest in a project such as Shipherd's had appeared to him to be, for the advancement of American interests in South America. He said he had agreed to act as counsel for the company on the condition that if it seemed probable at any time that there would be Congressional action affecting the interests of the company, he should be allowed to sever his connection. In explanation of the letters which he was said by Shipherd to have written him, in which he told the latter, in effect, to act as if American ships-of-war were already on their way to South America, and made statements which, it was thought, must have been made in pursuance of assurances from the State Department that the Government was to lend its influence to aid the claims of the company, Mr. Blair said that these expressions were based upon his own ideas of what the Government ought to do and what it would do.

The Anti-Chinese Immigration Bill was passed by the Senate on Friday, but will have to go back to the House for concurrence in the amendments made by the Senate. These amendments are unimportant.

Senator Edmunds made an oral report, by instruction of the Senate Committee on the Judiciary, on Monday, upon the President's message concerning the cowboy disturbances in Arizona, which suggested certain enabling legislation for the use of the Army as a *posse comitatus*. Mr. Edmunds said he had been instructed to say that in the opinion of the Committee there was no need of any further legislation, for the reason that the President had ample power, under the existing laws, to put down the disturbances referred to in his message.

On Saturday the House of Representatives declared, by a vote of 124 to 71, that John R. Lynch was entitled to the seat in the House from the Sixth District of Mississippi in the place of General James R. Chalmers. It was proved conclusively that there had been gross frauds perpetrated to give General Chalmers the seat. Mr. Lynch, who is colored, made an eloquent speech in support of his claim on Thursday.

The House of Representatives on Monday, by a vote of 150 to 65, fixed Tuesday of next week for the consideration of the bill to provide that the charters of nationa banks may be extended.

President Arthur has addressed a communication to our representative at St. Petersburg, directing him to invite the attention of the Czar to the atrocities committed upon the Jews in his dominion, to express the horror that was felt in this country in relation to their perpetration, and to ask him to exercise his authority to prevent their recurrence.

Ralph Waldo Emerson died at Concord, Massachusetts, on Thursday morning, of acute pneumonia.

The Republican State Convention of Tennessee met on Thursday and adopted a platform declaring against the repudiation of the State bonds, and favoring the acceptance of the proposition of the holders of the bonds to take sixty cents on the dollar and a lower rate of interest; opposing convict labor; declaring that the improvement of the navigation of the Mississippi, the Tennessee, and Cumberland Rivers and their tributaries is a proper matter for Congressional action; denouncing the Democratic opposition to internal improvement as Bourbonism not in harmony with the spirit of the new South; calling upon the Senators and Representatives in Congress to protect the coal, iron, cotton, and tobacco interests of the State by appropriate legislation; and declaring that President Arthur "has proved himself fully worthy of the confidence of the Republican party." Governor Hawkins was unanimously renominated for Governor.

At an Anti-Chinese State Convention in San Francisco, on Wednesday night, resolutions were adopted providing for boycotting the Chinese and all who deal with them, and pledging the members to assist when called upon in an overwhelming demonstration of public opinion and the power of numbers to prevent the landing of Chinese after a reasonable notice has been given. The delegates to the Convention were from trades assemblies.

Montford C. Rerdell, the indictment against whom was quashed last week, on account of a small technical error, was brought up for trial in the police court on Wednesday. Rerdell was ex-Senator Dorsey's secretary and agent, and as his case is inextricably mixed up with the cases against the other Star-route conspirators, the hearing was of great importance. Ex-Attorney-General Wayne MacVeagh and ex-Postmaster-General James appeared as witnesses for the Government. Mr. MacVeagh testified that Rerdell had voluntarily made important confessions to him at various times. He had told him that he had kept certain books and accounts which would show that Second Assistant Postmaster-General Brady was to receive a very large percentage of the money secured by any increase or expedition in the Star-routes, and that large sums were put down in the accounts as having been paid to Brady under an assumed name. Rerdell said that during the Congressional investigation which followed Brady's demand for $2,000,000, there was great alarm lest these books should be called for, and he pleaded sickness in order to postpone his examination by the Committee until a new set of books could be made in which these entries would not appear, and such new books were made under his direction. Rerdell described the money arrangements between Brady and the Dorsey combination, which he said were well understood by all the parties interested. These "money arrangements" were nothing more nor less than a system by which Brady got appropriations for the Post-office Department, and divided with the Dorsey combination. Mr. MacVeagh's testimony in regard to Rerdell's confession to him, of which the above is but a small part, was of great interest and importance. Mr. James testified that Rerdell had made a statement to him similar to that made to Mr MacVeagh, and that he afterward met Rerdell on the train between New York and Washington. At Trenton the conductor came in with two telegrams for Rerdell, who read them and handed them to Mr. James. They were from Dorsey, and in the first one, as far as Mr. James could recollect, he said, "We should not part in anger. Get off at Philadelphia and return." In the second he said, "You must not ruin my wife and family. Be sure and get off at Philadelphia and return." Rerdell said he would not get off, but would come to Washington and show the books to Mr. MacVeagh. On Thursday, Inspector P. H. Woodward, of the Post-office Department, testified in regard to Rerdell's confession. His testimony coincided in all particulars with the statements made by Mr. MacVeagh and Mr. James, but he testified in addition that Rerdell had said that the Dorsey combination had paid shares of mining stock to First Assistant Postmaster-General Tyner and Mr. A. M. Gibson, who was for some time a special officer of the Department of Justice. Mr. Gibson has denied that any mining stock was ever given or sold to him by Dorsey or the combination. Friday was taken up with record

evidence concerning one of the Dorsey routes, and Inspector Woodward was again a witness. The hearing was then adjourned until Thurs day, May 4, which is the day set for the beginning of the main trials.

The New York *Times* published on Thursday an account of the general condition of the crops throughout the country, from which it appears that the small grains promise well. Winter wheat will give an increased yield in nearly every State except Indiana, Ohio, and New York ; the last-named will produce much less than usual. The crop of spring wheat will be much larger than usual. In the great grain States west of the Mississippi the increase is especially marked, being in some cases as much as 50 per cent. In some of the old grain States, other grains—barley, oats, and rye especially—are replacing wheat, but in all of these States a large increase in acreage is reported and a large crop probable. Corn shows a very large increase in nearly every State in which it is cultivated at all. Cotton is expected to give at least an average crop, although the area devoted to it, owing to the floods, the partial abandonment of the "all-cotton" system, and the inability of the planters to obtain sufficient supplies, is much smaller than usual. The sugar-cane crop is looking exceedingly well, except, of course, in the flooded districts, where it has been killed. An average crop of tobacco and rice will be secured. Hay and grass crops have been much injured throughout the country, and a light yield is expected. The high price of potatoes has led farmers to devote an increased acreage to that vegetable this year. The fruit crop looks bad. Frosts have greatly injured peaches and small fruit in Virginia, Maryland, Delaware, and the Hudson valley. The great cattle-raising interests in the West are very flourishing, owing to the mild winter.

A great monopoly has been created by the union of the Edison Electric Light Company with the Gramme Electrical Company. By this combination the several large companies that control all the patents applying to existing systems of lighting by electricity are formed into one organization.

FOREIGN.

In the House of Commons on Wednesday Mr. Redmond, moving the second reading of the Land Law of Ireland Act Amendment Bill, drafted by Mr. Parnell, said he believed the necessity for amendment of the act is recognized by everybody both in and out of the House, and he believed the bill to be a crushing answer to the accusation that the Irish party desires to deprive tenants of the benefits of the Land Act. Mr. Gladstone, although he said the Government could not support the bill, praised the system for settling arrears sketched in it. He said he considered that relief should take the form of a gift and not of a loan. He saw in the Irish Bill the first gleam of hope on a dark subject; for, although he was confident of the power of the Empire, compulsion, he declared, was completely alien to the spirit of the Constitution. Mr. Gladstone referred to the proposals which he said it might be the duty of the Government to introduce during the present session for the direct purpose of maintaining peace in Ireland, and said he approved the application of the Irish Church Surplus Fund to aiding tenants in arrears, but feared the fund was not large enough for the purpose. Messrs. Healy, O'Shea, and Macfarlane expressed satisfaction with Mr. Gladstone's statement, and Mr. Healy said he believed the intentions of the Government, as indicated by Mr. Gladstone, were sincere. Lord Fitz-Maurice, Liberal, maintained that any plan for dealing with arrears should be compulsory. He declared that unless this question was dealt with, and a state of things introduced enabling the parties affected to start afresh, there would never be any peace or quiet in Ireland. He suggested that Griffith's valuation be established as the basis of rents until the Land Court should be able to fix them. Mr. Forster then announced that the Land Commission would issue a circular giving notice that it is ready to send a valuator to farms where landlords and tenants agree to accept his decision. This speech of Mr. Gladstone's, and the interchange of civilities between him and the Land Leaguers, were considered as indicating a change of policy in Irish affairs, an impression which was strengthened by the resignation of Earl Cowper, Lord Lieutenant of Ireland, and the appointment of Earl Spencer in his place. On Friday, when Mr. Joseph Cowen asked, in the House of Commons, whether the imprisoned members of Parliament, who had been arrested because they obstructed the Land Act, would now be released, since Mr. Gladstone had approved the bill drafted by Mr. Parnell, Mr. Gladstone replied that Mr. Forster would soon enter fully into the subject, as the question could not be answered in the scope of a simple reply to a question.

In the House of Lords on Monday evening, Earl Granville, Secretary of State for Foreign Affairs, announced the resignation of Mr. W. E. Forster, Chief Secretary for Ireland, and the intention of the Government to release the three imprisoned members of Parliament. He explained that Earl Cowper had not resigned the Lord-Lieutenancy on account of any differences with the Government in regard to its policy. He added that the Government had no new policy to announce in regard to Ireland, but that the Coercion Act would not be renewed, and that the Government intended to deal with the question of arrears of rent and the Bright clauses of the Land Act. He said that the cases of the other suspects would be reconsidered with a view to their ultimate release, but that this reconsideration would not be extended to the case of Michael Davitt. In the House of Commons Mr. Gladstone made an announcement similar to that of Earl Granville in the House of Lords. He said that the Government, instead of renewing the Coercion Act, would introduce a measure remedying the administration of justice in Ireland, which measure, he said, would deal with the protection of life and property. In regard to coercion, however, he said that if peace and security should be jeopardized by the action of secret societies, the Government would consider it its duty to propose counteracting measures. He declared that the Government did not think the Coercion Act had failed, as it had served an important purpose in a great crisis. Mr. Forster, he said, had resigned because he was not willing to share the responsibility of the release of the suspects. Mr. Gladstone warmly praised the manner in which Mr. Forster had performed his duties, and expressed regret at his retirement. He declared further that none of the measures announced in the Queen's speech at the opening of the session, except the resolutions in regard to the rules of parliamentary procedure, would be allowed to stand in the way of the measures which the Government would introduce for restoring peace and order in Ireland.

Mr. Sexton, at the conclusion of Mr. Gladstone's speech, said that the Government had taken the first step in a policy that would crown its administration with glory, and would produce ties of mutual interest between Ireland and England, while Sir Stafford Northcote compared the Government to a pendulum swinging from one side back to another. The London *Times* says that this new policy now to be tried in Ireland is to be one of concession and conciliation pure and simple.

Messrs. Parnell, Dillon, and O'Kelly were released from Kilmainham jail on Tuesday night. There was great excitement in Dublin on the reception of the news of the resignation of Mr. Forster. Crowds gathered in the streets, and cheered for Mr. Parnell and groaned for Mr. Forster, and bands paraded the city playing the national airs. It is said that the Right Hon. Joseph Chamberlain, President of the Board of Trade, or Mr. George Shaw-Lefevre, Commissioner of Works and Buildings, will probably succeed Mr. Forster.

The Lords' Committee on the Land Act has made a preliminary report, in which exception is taken to the manner in which the decisions of the sub-commissions in regard to fair rent are given. The report declares the purchase clauses of the Land Act to be a failure, and specially recommends that purchase money be advanced by the state at 3 per cent. interest, repayment to be made in instalments of 3¼ per cent. for sixty-six years, or of 4 per cent. for forty-six years ; that the cost of the scheme be defrayed by the Church Surplus Fund ; that a special department be created to carry out this scheme, and that all arrears accrued before 1878 be cancelled, and those accrued since be capitalized and added to the purchase money.

Mr. Darwin's funeral and interment took place in Westminster Abbey on Wednesday. The pall-bearers were Mr. Lowell, the Duke of Argyll, Lord Derby, Professor Huxley, Sir Joseph Hooker, Sir John Lubbock, Alfred Russel Wallace, and William Spottiswoode. Many other distinguished men were present.

Prince Leopold was married to Princess Helena of Waldeck, on Thursday, with great pomp, at St. George's Chapel, in Windsor. The Archbishop of Canterbury was the chief officiating clergyman, and was assisted by the Bishops of London, Oxford, Worcester, and Winchester and the Dean of Windsor. There was a great crowd of distinguished and titled persons present.

Dr. Lamson was hung for the murder of his brother-in-law, Percy Malcolm John, a student at Blenheim House School, on Friday morning. He showed great nervousness at the gallows.

An imperial order has been promulgated in Russia directing extraordinary measures to be taken for the public safety in the Government of Nicolaieff and the city of Sebastapol, and placing both under the jurisdiction of General Gurko. It is also stated that the details have been settled of a plan for the construction of new forts at Warsaw, Kovno, and Gonionds. The forts are to be completed in 1892, and will cost sixty million rubles.

Another plot to kill the Czar has been discovered. A man named Bogdanovitsch recently submitted to the authorities a plan for the illumination of the Kremlin by electric light. Inquiries were instituted, and it was discovered that the intention was to blow up the whole Kremlin during the festivities attending the coronation of the Czar. At Bogdanovitsch's residence there were found a number of peasants' caps, the crowns of which were filled with explosive material. It is supposed that these caps were intended to be thrown into the air in greeting to the Czar, and that on falling to the ground their contents would have the effect of bombs. Bogdanovitsch and 300 Nihilists have been arrested.

Many shops and houses belonging to the Jews were destroyed by fire on Tuesday, the 26th, in the town of Kamenetz, in the Government of Podolsk. The damage is estimated at 500,000 rubles. In the House of Commons Thursday evening, Sir Charles Dilke, Under Foreign Secretary, replying to Baron de Worms, stated that the British Consul at Odessa had confirmed the reports of anti-Jewish atrocities at Balta. One person was killed and many others wounded.

Premier de Freycinet received the *bureau* of the Committee on the Franco-American treaty on Monday. One of the spokesmen stated that American opinion seemed to be veering from the system of high tariffs, and he thought the present was an opportune moment for endeavoring to improve commercial relations with the United States. M. de Freycinet replied that he was favorable to the idea of a treaty of commerce between the two republics.

TUESDAY, May 2, 1882.

BLAINE-BELMONT.

THE quarrel between Mr. Blaine and Mr. Belmont was a very unseemly exhibition, the occurrence of which every good citizen will sincerely deplore. But it was not a mere encounter of insignificant persons pelting each other with unsavory epithets; and, being connected with an affair of great moment, it cannot be passed over as an ordinary brawl would be. Mr. Blaine had asked to be heard by the House Committee on Foreign Affairs about his official conduct as Secretary of State with regard to the Peruvian difficulty, his evident object being to disarm the criticism that conduct had met with. Mr. Blaine is one of the most skilful public speakers in the country, and understands to perfection the art of arranging light and shade in the presentation of a subject. He made an elaborate statement before the Committee in his own peculiar way, and the Committee did not seem disposed to subject his statements to any further examination, when Mr. Belmont, its youngest member, undertook that task. It was a somewhat risky venture, for Mr. Blaine is also known as a parliamentary pugilist of careful training and large experience—full of resource, quick at repartee, and a perfect master of every trick of the trade, from the explosion of indignant wrath and of defiant patriotism down to a cajoling smile or even the blush of modesty. Mr. Belmont, on the other hand, is a young man, of scarcely any experience on the political stage, very little parliamentary training and practice, and but a limited knowledge of affairs. But he is said to take his duties as a member of Congress in very solemn earnest, to work hard to inform himself, and generally to devote himself with great energy and singleness of purpose to the business before him. That in an encounter of wit and repartee he would prove no match for Mr. Blaine was to be expected; but he seems to have undertaken the perilous task of getting at the bottom truth, which would have discouraged other people, simply because other members of the Committee did not undertake it, but seemed rather inclined to let Mr. Blaine off on his own showing.

This sort of courage deserves respect. There is no doubt that Mr. Belmont honestly believed that Mr. Blaine had used the Landreau claim to force a difficulty between the United States and Chili by making demands which notoriously could not be complied with, and that a certain passage in one of Mr. Blaine's despatches would bear out such a construction if rightly interpreted. Mr. Blaine employed all his art to evade the point and to envelop the question in clouds of words, but Mr. Belmont, with dogged perseverance, would always return to the same sore spot and try to push the probe into it. This is what irritated Mr. Blaine so that he actually lost his temper. He has gone through too many experiences to lose his temper easily. He apparently lets it go sometimes, when, in fact, he has it under perfect control; but this time he actually lost it. When he saw that neither wit, nor sarcasm, nor the loftiest assertion of superiority, nor the profoundest patriotic indignation the most experienced stump-speaker can express, nor the most skilful feints and thrusts of the dialectic fencer, could divert this stubborn young man from that one point, he got actually angry, and used expressions which a man advanced in years, with the consciousness of a perfectly clear cause and the feeling of true moral superiority in him, would probably not have used against one so much younger, so little experienced, and having the sympathy of the bystanders against him.

The real trouble, and the true cause of Mr. Blaine's anger, was that Mr. Belmont, in his construction of the meaning of the despatch, was substantially right. Other acts of Mr. Blaine concerning the same subject, taken in connection with the despatch, will only strengthen that impression with every candid mind. But it receives especial strength from the extraordinary variety of expedients Mr. Blaine resorted to under Mr. Belmont's stubborn examination. Now he asserted that everything he did was inspired by the most ardent devotion to the cause of peace; and then he represented the war in South America as an attack, not by Chili, but by England upon Peru for the sake of plunder, and gave us to understand that, if he had had his way, England would not have got that plunder without fighting for it. Now by a most wonderful perversion of technical terms he spoke of the Landreau claim as a thing he was in duty bound to take up without further inquiry—*res adjudicata*—because one House of Congress had recommended it while the other refused to notice it, and because the State Department had declared it to be deserving inquiry, without passing upon its merits and without expressing the least inclination to enforce it—the most marvellous doctrine of *res adjudicata* ever heard of; and then again he represented the same Landreau claim as a thing of no importance, which had absolutely no influence upon his diplomatic action. Mr. Blaine has, in this very examination, been on so many sides of every question that he authorizes us to use our discretion in judging where he really was. And looking calmly at the whole case, most people will come to the conclusion that Mr. Belmont was not far out of the way.

It should be remembered also, to Mr. Belmont's credit, that he is the only member of the Committee who from the first showed any desire to make the Peruvian investigation thorough. When Shipherd first appeared before the Committee he seems to have so frightened them by a vague intimation that he would, if called upon, make unpleasant revelations about the share of Congressmen in his business, that they promptly resolved that the investigation should not include Congressmen. Mr. Belmont defeated this little plan by introducing a resolution into the House, against which no one dared to vote, directing the Committee to inquire with respect to all persons whatsoever.

FRENCH FINANCE.

WE called attention last September to a very sharp attack made on the financial system of the French Republic, by M. Cucheval-Clarigny in the *Revue des Deux Mondes*, in which he pronounced the budgets for several years back wholly deceptive. He maintained that there had really been a deficit in every year since 1875 for which a surplus had been announced, owing to the growth of the floating debt under the baneful system of opening "supplemental credits," on the mere decree of the Executive, which the Republic has inherited from the Empire. The weight of M. Cucheval-Clarigny's attack was, however, much diminished by the fact that he was an old Bonapartist, and was therefore, like all the Bonapartists, open to the suspicion of being ready to say anything to damage the Republic.

Another and more damaging criticism has now made its appearance in the same magazine, from the pen of an economist, M. Leroy-Beaulieu, whose loyalty to the established régime is unquestioned, and whose authority as a financier is very high. He declares that French finances are in a condition which, if not critical, is one from which serious injury to the public credit might any day result. One has only to read his statement to understand the rapidity with which M. Léon Say reversed the foreign policy of Gambetta's ministry, and withdrew France completely from everything having an appearance of foreign adventure. In fact, it explains the aversion with which nearly all French politicians at this moment regard war, and makes it almost certain that no European complication, involving France in the smallest degree, is likely to be brought about at present with her consent or connivance.

The situation as described by M. Leroy-Beaulieu is in brief this: There is a floating debt of nearly $600,000,000; ordinary annual appropriations of $600,000,000 more; a burden of taxation, including that of the Departments and Communes, of $800,000,000; and an annual outlay of one sort or another of about $1,000,000,000. This enormous floating debt is created in very much the manner described by M. Cucheval-Clarigny. Owing to a long-established and very bad practice of French finance, the budget of each year is made up and passed before the accounts of the previous year have been settled. The estimates consequently are always based, not on the result of the previous year, but on that of the year before. If the year before has shown a surplus, it is assumed that the succeeding year did so also, when it may really have shown a deficit. In this way errors of the grossest kind are carried forward, increasing as they go. This would perhaps be of less consequence if when discovered they were dealt with in the ordinary budget. But they are not. In the ordinary budget nothing is allowed to appear which does not look pleasant. The errors and deficits of past years are thrust aside into the floating debt, and this is nearly every year increased by supplemental credits opened after the regular budget has been passed, for all sorts of purposes, and of late years with a recklessness which has been by no means heretofore a characteristic of French finance even in the Imperial days.

One great cause of this recklessness is the gradual substitution in the Chambers of the American for the English method of dealing with the estimates. From the Restoration down to 1875, the budget had been left in France, as in England, completely in charge of the Ministry, which was held in the main

responsible for it, and had to stand or fall by it. Individual members undoubtedly criticised it, as they do in the British House of Commons, and moved the reduction or erasure of this or that item. But the English rule, that the budget as a whole must not be attacked so as to upset it, or disturb its equilibrium, unless with the view of declaring the total incompetence of the Ministry, and their expulsion from office, was, on the whole, followed. Lately, however, and notably since 1875, the year in which the tide began to turn after the confusion and distress of the war, the individual members have broken through this rule, and, like our Representatives, have no hesitation in making any breaches they please in the Minister's scheme, and seizing on as much of his resources as they can reach, either for the benefit of "the deestreect," or for any interest which each happens to have taken under his special protection. One demands an increase of salaries for the Custom-house officers or the letter-carriers; another wants to have more done for the schools, or for the roads, or the museums, and so on. The result of this system in 1881 was that an apparent surplus of $47,000,000 ended in a real deficit of $2,500,000. In fact, the Minister, as soon as the years of prosperity began, practically lost control of the finances, or had to share it with the whole Chamber. It was no wonder that under these circumstances M. Léon Say, when he took office, peremptorily abandoned the enterprising foreign policy of his predecessors, set aside their extensive scheme of public improvements, and refused to consider the purchase of the great railroads.

What adds to the difficulty of the situation is that the Government owes the savings-banks an enormous sum—about $285,000,000, a large part of which it has used in public improvements, and of which $100,000,000 has not been funded in any way, and really constitutes an item in the floating debt—on which it is paying four per cent. interest, which the depositors could not on similar security get anywhere. Nevertheless, nothing is done to reduce this interest, for the same reason which prevents the refunding of the five per cent. loans raised during the war, and which, like the savings-bank deposits, are widely distributed among the peasantry and workingmen, whom the Republic does not care to offend. But, as M. Leroy-Beaulieu points out, suppose there should come another cataclysm like the war of 1870, and the Treasury should be plunged in difficulties, and become even temporarily unable to take care of the savings-bank deposits which it now holds in cash, how terribly the alarm and discontent inseparable from such a situation would be aggravated.

As to the remedy, to fund the floating debt at once would need a loan of at least $300,000,000, and this it is not supposed the money market would bear at present, except on terms which would be very injurious to the public credit, and M. Léon Say virtually pledged himself, on taking office, not to make a new loan. So he proposes to get out of his difficulties by distributing a part of the floating debt through the appropriations of several years, and by funding, in non-negotiable three per cents, the amount the Government owes as trustee, or about $240,000,000. This of course looks very like a new loan, and many critics ask, What is it but a loan? But M. Léon Say maintains that inasmuch as it will not go on the market, and be bought or sold or transferred, it will have none of the bad features of a loan, and will have the great merit of bringing something like order into the existing confusion. It is quite certain, however, that no matter how well he may manage, we shall not for some years see any revival of the old French love of adventure, and shall probably not see any revival of Gambetta's influence until the financial horizon is clearer, for he represents, more than any other man of prominence in France, the unknown and the expensive, both in home and foreign policy.

EMERSON.

THE almost simultaneous deaths of Adams and Jefferson seemed scarcely more remarkable to their contemporaries than is the closeness in time between the funerals of the two authors who have most contributed to the literary fame of the United States during the last half century. And, looking across the water, the nearness between the deaths of Darwin and of Emerson reminds us that each was in his way the founder of a school of thought, and that by this joint bereavement both England and America lose their recognized intellectual leaders.

It is sometimes doubtful whether one who initiates a fresh impulse, whether in literature or in life, does it with full and conscious purpose. There can be no such doubt in the case of Emerson. From the beginning to the end of his first volume ('Nature'), the fact is clear that it was consciously and deliberately a new departure. Those ninety brief pages were an undisguised challenge to the world. On the very first page the author complains that our age is retrospective—that others have "beheld God and nature face to face; we only through their eyes. Why should not we," he says, "also enjoy an original relation to the universe? Why should not we have a poetry and philosophy of insight and not of tradition?" Thus the book begins, and on the very last page it ends, "Build, therefore, your own world!" At any time, and under any conditions, the first reading of such words by any young person would be a great event in life, but in the comparative conventionalism of the literature of that period it was a new heaven and a new earth. And it was soon followed by other similar appeals. On the very first page of the first number of the *Dial* (July, 1840) the editors speak of "the strong current of thought and feeling which for a few years past has led many sincere persons in New England to make new demands on literature, and to repudiate that rigor of our conventions of religion and education which is turning us to stone."

Emerson's "Thoughts on Modern Literature," contained in the second number of the *Dial* (October, 1840), struck the keynote of a wholly new demand. In this he has a frank criticism of Goethe, whom he boldly arraigns for not rising above the sphere of the conventional. Goethe, he says, tamely takes life as it is, "accepts the base doctrine of Fate, and gleans what straggling joys may yet remain out of its ban."

"He was content to fall into the track of vulgar poets, and spend on common aims his splendid endowments, and has declined the office proffered now and then a man in many centuries in the power of his genius—of a Redeemer of the human mind . . . Let him pass. Humanity must wait for its physician still, at the side of the road, and confess as this man goes out that they have served it better who assured it out of the innocent hope in their hearts that a Physician will come, than this majestic Artist, with all the treasures of wit, of science, and of power at his command."

Again, Emerson says, in the same paper:

"He who doubts whether this age or this country can yield any contribution to the literature of the world only betrays his blindness to the necessities of the human soul." . . . "What shall hinder the Genius of the Time from speaking its thought? It cannot be silent if it would. It will write in a higher spirit, and a wider knowledge, and with a grander practical aim, than ever yet guided the pen of poet; . . . and that which was ecstasy shall become daily bread."

It was the direct influence of words like these to arouse what is the first great need in a new literature—self-reliance. It is said by Plutarch that when Cicero as a young man consulted the oracle at Delphi the advice given him was to make his own genius, and not the opinion of others, the guide of his life. Niebuhr thinks that, if so, this is one of the answers which might tempt one to believe in the actual inspiration of the priestess. The impulse to intellectual self-reliance given in the so-called Transcendental period was responsible for many of the excesses of that time, but it was the only way to make strong men and women. The *Dial* itself revealed liberally some of the follies of the movement it represented, but nothing can ever deprive it of its significance as offering the first distinctly American impulse in literature. And while it is difficult, in this period of perhaps temporary reaction against the ideal school of thought, to fix Emerson's permanent standing among thinkers, his influence as a stimulus was quite unequalled during the era when our original literature was taking form.

It will be remembered by many that during Kossuth's very remarkable tour in this country—when he adapted himself to the local traditions and records of every village as if he had just been editing the local annals of each town—he had the tact to identify Emerson, in his fine way, with Concord, and said in his speech there, turning to him, "You, sir, are a philosopher. Lend me, I pray you, the aid of your philosophical analysis," etc., etc. He addressed him, in short, as if he had been Kant or Hegel. But in reality nothing could be remoter from Emerson than such a philosophic type as this. He was only a philosopher in that ancient sense of which his friend Alcott still offers a fainter adumbration: his mission was to sit, like Socrates, beneath the plane-trees, and offer profound and beautiful aphorisms, without even the vague thread of the Socratic method to tie them together. Once, and once only, in his life he seemed to be approaching the attitude of continuous analysis—that was in his course of lectures on "The Natural Method of Intellectual Philosophy," given in 1858 or thereabouts; the fundamental proposition of these lectures being that "every law of nature is a law of mind," and all material laws are symbolical statements. These few lectures certainly inspired his admirers with the belief that their great poetic seer might commend himself to the systematizers also. But for some reason these lectures have never been published; and Mr. Emerson's latest books had the same detached and fragmentary character as his earliest. He remains still among the poets, not among the philosophic doctors, and must be permanently classified in that manner.

Yet it may be fearlessly said that, within the limits of a single sentence, no man who ever wrote the English tongue has put more meaning into words than Emerson. In his hands, to adopt Ben Jonson's vigorous phrase, words "are

rammed with thought." No one has reverenced the divine art of speech more than Emerson, or practised it more nobly. "The Greeks," he once said in an unpublished lecture, "anticipated by their very language what the best orator could say"; and neither Greek precision nor Roman vigor could produce a phrase that Emerson could not match. Who stands in all literature as the master of condensation if not Tacitus? Yet Emerson, in his speech at the anti-Kansas meeting in Cambridge, quoted that celebrated remark by Tacitus when mentioning that the effigies of Brutus and Cassius were not carried at a certain state funeral; and in translating it, bettered the original. The indignant phrase of Tacitus is, "Præfulgebant . . . eo ipso quod . . . non visebantur," thus giving a grand moral lesson in six words; but Emerson gives it in five, and translates it, even more powerfully: "They glared through their absences." Look through all Emerson's writings, and then consider whether in all literature you can find a man who has better fulfilled that aspiration stated in such condensed words by Joubert, "to put a whole book into a page, a whole page into a phrase, and that phrase into a word." After all, it is phrases and words won like this which give immortality. And if you say that, nevertheless, this is nothing, so long as an author has not given us a system of the universe, it can only be said that Emerson never desired to do this, but left on record the opinion that "it is too young by some ages yet to form a creed." The system-makers have their place, no doubt; but when we consider how many of them have risen and fallen since Emerson began to write—Coleridge, Schelling, Cousin, Comte, Mill, and so on, down to the Hegel of yesterday and the Spencer of to-day—it is really evident that the absence of a system cannot prove much more short-lived than the possession of that commodity.

It must be left for future generations to determine Emerson's precise position even as a poet. There is seen in him the tantalizing combination of the profoundest thoughts with the greatest possible variation in artistic work—sometimes mere boldness and almost waywardness, while at other times he achieves the most exquisite melody touched with a certain wild grace. He has been likened to an æolian harp, which now gives and then perversely withholds its music. Nothing can exceed the perfection of

> "Thou canst not wave thy staff in air
> Nor dip thy paddle in the lake
> But it carves the bow of beauty there,
> And the ripples in rhymes the oar forsake."

Yet within the compass of this same fine poem ("Wood Notes") there are passages which elicited from Theodore Parker, one of the poet's most unfaltering admirers, the opinion that a pine-tree which should talk as Mr. Emerson's tree talks would deserve to be plucked up and cast into the sea. His poetic reputation was distinctly later in time than his fame as an essayist and lecturer; and Horace Greeley was one of the first, if not the first, to claim for him a rank at the very head of our American bards. Like Wordsworth and Tennyson, he educated the public mind to himself. The same verses which were received with shouts of laughter when they first appeared in the *Dial* were treated with respectful attention when collected into a volume, and it was ultimately discovered that they were among the classic poems of all literature. In part this was due to the fact that Emerson actually did what Margaret Fuller had reproached Longfellow for not doing—he took his allusions and his poetic material from the woods and waters around him, and wrote fearlessly even of the humble-bee. This was called by some critics "a foolish affectation of the familiar," but it was recognized by degrees as true art. There was thus a gradual change in the public mind, and it turned out that in the poems of Emerson, not less than in his prose, the birth of a literature was in progress.

It must, on the other hand, be remembered, in justice to the public mind, that Emerson disarmed his critics by some revision of his poems, and they appeared, and actually were, less crude and whimsical when transplanted into the volume. In the very case just mentioned, the original opening,

> "Fine humble-bee! fine humble-bee!"

had a flavor of affectation, whereas the substituted line,

> "Burly, dozing humble-bee,"

added two very effective adjectives to the original description. Again, in the pretty verses about the maiden and the acorn, the lines as originally published stood thus:

> "Pluck it now! In vain—thou canst not!
> It has shot its rootlets down'rd.
> Toy no longer, it has duties;
> It is anchored in the ground."

There probably is not a rougher rhyme in English poetry than that between "down'rd" and "ground"; but, after revision, this softer line was substituted,

> "Its roots have pierced yon shady mound,"
